Abstract

Artificial Intelligence (AI) is rapidly transforming the design industry by introducing data-driven, generative, predictive, and automated approaches to creative and technical processes. Interior design, traditionally dependent on human creativity, spatial understanding, material knowledge, and client preferences, is increasingly influenced by AI-powered tools capable of generating design concepts, visualizations, layouts, material combinations, lighting solutions, and personalized spatial recommendations. Recent developments in generative AI, machine learning, computer vision, natural language processing, and multimodal systems have expanded the possibilities for designers to explore a larger number of alternatives in less time. This research paper examines the opportunities, challenges, and future perspectives associated with the integration of Artificial Intelligence into interior design. The study adopts a qualitative systematic literature review approach and synthesizes recent research on AI-assisted architectural and built-environment design. The review indicates that AI can support concept generation, space planning, 3D visualization, material selection, sustainability analysis, personalization, and client communication. However, issues related to creativity, algorithmic bias, intellectual property, data privacy, professional responsibility, design authenticity, technical skills, and overdependence on automated systems remain significant challenges. Recent systematic reviews show that AI research in design is strongly concentrated in early conceptual and schematic stages, while later stages requiring detailed technical, contextual, and professional judgment remain comparatively underexplored. The paper argues that AI should not be viewed as a replacement for interior designers but as an augmentation technology that can strengthen human creativity, decision-making, and productivity. A human-centred AI framework combining technological capability with professional expertise, ethical safeguards, cultural sensitivity, and user participation is proposed. The study concludes that the future of interior design will increasingly depend on effective human–AI collaboration rather than complete automation.

Keywords: *Artificial Intelligence, Interior Design, Generative AI, Machine Learning, Generative Design, Human–AI Collaboration, Smart Interiors, Sustainable Design, Design Technology*

Introduction

Interior design is a multidisciplinary field concerned with the planning, organization, functionality, aesthetics, comfort, safety, and experiential quality of interior environments. Traditionally, interior designers rely on creativity, professional experience, site analysis, client interviews, drawings, material knowledge, and iterative design processes. Although these methods remain important, the rapid development of Artificial Intelligence has introduced new possibilities for improving the efficiency and quality of design processes. Artificial Intelligence refers to computational systems capable of performing tasks associated with human intelligence, including learning, pattern recognition, prediction, decision-making, language processing, and image generation.

In the context of design, AI can process large quantities of visual, spatial, environmental, and user-related data and use these data to support design decisions. The emergence of generative AI has accelerated this transformation.Generative AI systems can produce images, text, 3D concepts, and other forms of content based on user-defined prompts or design parameters. Recent research indicates that generative AI is increasingly being applied across architectural and built-environment design, including interior and exterior design. A 2025 state-of-the-art review examined 179 studies covering site layout, interior design, and exterior design and identified user-centric, data-driven, hybrid, and benchmarking approaches as important research directions. Similarly, a systematic review of 161 research papers published between 2014 and 2024 found that AI applications were concentrated heavily in schematic and early design stages, accounting for 68.94% of identified applications. Images represented a dominant data format, while multimodal and graph-based approaches were identified as emerging areas. These developments suggest that AI has moved beyond being merely a visualization tool and is becoming an active component of the design process. However, the integration of AI raises important questions: Can AI enhance rather than diminish human creativity? Who owns AI-generated designs? How should designers validate AI-generated outputs? Can AI adequately understand culture, emotion, identity, and individual preferences? What professional skills will interior designers require in an AI-supported future?

This paper addresses these questions by examining the opportunities, challenges, and future perspectives of AI in interior design.

Research Problem

The traditional interior design process can be time-consuming because it involves repeated concept development, visualization, material selection, space planning, client revisions, and documentation. Designers may need to generate multiple alternatives before identifying an appropriate solution.

AI provides the possibility of automating or accelerating several of these activities. However, rapid adoption without appropriate professional and ethical frameworks may create new problems. AI-generated designs may contain inaccuracies, cultural biases, inappropriate material suggestions, unrealistic spatial arrangements, or stylistic repetition. The central research problem is therefore:

How can Artificial Intelligence be integrated into interior design to improve creativity, efficiency, personalization, and sustainability while preserving human expertise, ethical responsibility, cultural identity, and professional design judgment?

Objectives of the Study

The major objectives of the study are:

1. To examine the role of Artificial Intelligence in contemporary interior design.
2. To identify major AI technologies used in interior design.
3. To analyze the opportunities provided by AI-assisted interior design.
4. To examine the challenges and limitations associated with AI adoption.
5. To investigate the influence of generative AI on creativity and design exploration.
6. To examine the potential contribution of AI to sustainable interior design.
7. To explore the role of human–AI collaboration in future interior design practice.
8. To propose future research directions for AI-enabled interior design.

Research Questions

The study addresses the following research questions:

RQ1: What are the major applications of Artificial Intelligence in interior design?

RQ2: How does AI influence creativity and design exploration?

RQ3: What opportunities does AI provide for personalization, efficiency, and sustainability?

RQ4: What are the major technological, ethical, and professional challenges associated with AI in interior design?

RQ5: How can human designers and AI systems effectively collaborate in future interior design practice?

Methodology

This study adopts a **qualitative systematic literature review approach**.

Relevant scholarly literature concerning Artificial Intelligence, generative AI, architectural design, built-environment design, and interior design was examined. Recent peer-reviewed literature was given particular attention because AI technologies are developing rapidly.

1 Search Themes

The literature search was organized around the following keywords:

- Artificial Intelligence and Interior Design
- Generative AI and Interior Design
- AI in Architectural Design
- Machine Learning and Design

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

- Generative Design
- AI-assisted Space Planning
- AI and Sustainable Design
- Human–AI Design Collaboration
- AI and Creativity
- Virtual Reality and AI
- Smart Interior Design

2 Inclusion Criteria

Studies were considered relevant when they:

- examined AI or machine learning in design;
- discussed generative AI or generative design;
- addressed architectural, built-environment, or interior design;
- examined design automation, visualization, optimization, or personalization;
- discussed ethical or professional implications of AI.

3 Exclusion Criteria

Studies unrelated to design, studies without meaningful AI applications, and non-relevant technical publications were excluded.

4 Analytical Approach

The selected literature was thematically analyzed under five major categories:

1. AI technologies and applications;
2. opportunities;
3. challenges;
4. human–AI collaboration;
5. future perspectives.

A recent review of generative AI models categorized architectural applications into concept image design, 3D form design, floor-plan design, façade design, structural-system design, and section design, demonstrating that AI can potentially contribute across multiple stages of design development.

6. Artificial Intelligence Technologies Relevant to Interior Design

1 Machine Learning

Machine Learning enables computer systems to identify patterns from data and generate predictions or recommendations. In interior design, ML can be used to analyze user preferences, previous design projects, environmental data, spatial configurations, and material characteristics.

2 Generative AI

Generative AI can produce new visual and textual design alternatives from prompts and reference information. It can assist designers during the conceptual stage by rapidly producing multiple stylistic options.

Generative AI research in architectural design has expanded rapidly, with GANs, transformers, diffusion models, and other foundation-model approaches becoming increasingly important.

3 Computer Vision

Computer vision enables AI systems to interpret photographs, drawings, plans, and spatial environments. Potential applications include room recognition, furniture detection, floor-plan analysis, and identification of existing spatial elements.

4 Natural Language Processing

Natural Language Processing allows designers and clients to communicate design requirements using natural language.

For example, a client could provide a requirement such as:

"Design a compact, natural-looking living room with warm lighting, sustainable materials, and sufficient storage."

An AI system could convert this requirement into preliminary design concepts.

5 Optimization Algorithms

Optimization-based AI can evaluate multiple design alternatives according to constraints such as:

- space utilization;
- lighting;
- energy consumption;
- circulation;
- furniture arrangement;
- cost;
- material usage.

Machine-learning-assisted generative design has been identified as an important evolution from rule-based design systems because models can learn design patterns from examples rather than depending entirely on manually defined rules.

7. Applications of AI in Interior Design

1 Concept Generation

AI can rapidly generate multiple interior design concepts based on style, color, materials, spatial function, and user requirements.

Instead of creating one concept manually and revising it repeatedly, designers can use AI to explore many alternatives during the initial stage.

2 Space Planning

AI can assist in arranging furniture, circulation paths, activity zones, and functional areas.

For example, AI can analyze a room's dimensions and suggest alternative furniture arrangements while considering movement and functional requirements.

3 3D Visualization

AI-assisted visualization allows designers to generate realistic representations of proposed interiors.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

This can improve communication between designers and clients because clients can understand a proposed design before physical implementation.

4 Material Selection
AI can assist in selecting materials based on:
- appearance;
- cost;
- durability;
- environmental performance;
- maintenance;
- availability;
- user preferences.

5 Colour Recommendation
AI systems can analyze visual relationships and recommend colour palettes according to design styles and user preferences.

6 Lighting Design
AI can help analyze daylight, artificial lighting, spatial function, and user requirements to support lighting decisions.

7 Personalized Interior Design
One of the most significant opportunities is personalization.
AI can potentially analyze:
- lifestyle;
- age-related requirements;
- functional preferences;
- aesthetic preferences;
- budget;
- spatial constraints.

The result can be a design recommendation tailored to individual users.

8 Sustainable Interior Design
AI can support sustainable decision-making by comparing materials, energy requirements, daylight availability, thermal conditions, and environmental performance.
AI-supported design can therefore contribute to more resource-efficient interior environments.

9 Smart Homes
The integration of AI with Internet of Things technologies can create adaptive interior environments.
Examples include:
- automated lighting;
- intelligent temperature control;
- occupancy-based systems;
- voice-controlled environments;
- adaptive shading;
- personalized environmental settings.

8. Opportunities of AI in Interior Design

1 Increased Design Efficiency
AI can automate repetitive tasks and reduce the time required to generate design alternatives.

2 Greater Design Explorations
AI allows designers to explore many possibilities quickly. This can be especially valuable during conceptual design.
Recent systematic research shows that AI applications are currently concentrated in early design stages, suggesting that concept generation and schematic exploration are among the strongest current applications.

3 Improved Client Communication
AI-generated visualizations can make design proposals easier for non-specialist clients to understand.

4 Cost Optimization
AI can potentially compare different material and furniture options according to budget constraints.

5 Accessibility
AI can support design solutions for users with diverse physical and cognitive requirements, including accessible circulation, ergonomic furniture arrangements, and user-specific environmental controls.

6 Sustainability
AI can help designers compare environmental performance and identify more sustainable alternatives.

8.7 Design Education
AI can become a learning tool for students by enabling rapid experimentation with styles, spatial arrangements, and design concepts.

9. Challenges of AI in Interior Design

1 Loss of Human Creativity
One concern is that excessive dependence on AI could encourage designers to accept generated solutions rather than develop independent creative thinking.
AI should therefore function as a creative partner rather than a substitute for human judgment.

2 Algorithmic Bias
AI models learn from datasets. If training data are culturally narrow or biased, generated designs may reproduce those biases.

3 Cultural Identity
Interior environments often express cultural identity, traditions, local materials, and social practices. AI may produce visually attractive designs without adequately understanding the cultural meaning behind design elements.

4 Intellectual Property
AI-generated images may raise questions about copyright, ownership, training data, and originality.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

5 Data Privacy

Personalized AI design may require information about users, homes, lifestyles, preferences, and spatial conditions. Such information must be handled responsibly.

UNESCO's guidance on generative AI emphasizes human-centred development and highlights privacy, ethical validation, inclusion, equity, and cultural diversity as important considerations.

6 Technical Accuracy

A visually impressive AI-generated interior may not necessarily be technically feasible.

For example, an AI-generated image may fail to represent:

- structural constraints;
- electrical requirements;
- plumbing;
- building codes;
- accessibility standards;
- material dimensions;
- construction feasibility.

Therefore, professional validation remains essential.

7 Skill Gap

Interior designers may require new skills related to:

- AI prompting;
- digital visualization;
- data interpretation;
- computational design;
- AI ethics;
- model evaluation.

9.8 Overdependence on Technology

Complete dependence on automated design systems could reduce professional judgment and design diversity.

10. AI and Human Creativity

The relationship between AI and creativity is one of the most important questions in contemporary design research.

AI can generate combinations that may not be immediately considered by a human designer. However, AI does not independently possess the same cultural, emotional, experiential, and contextual understanding as a professional designer.

Human designers contribute:

- empathy;
- cultural understanding;
- professional responsibility;
- contextual knowledge;
- emotional intelligence;
- ethical judgment;
- client interpretation.

AI contributes:

- rapid generation;
- data processing;
- pattern recognition;
- visualization;
- optimization;
- alternative exploration.

Therefore, the strongest model is likely to be **human–AI collaborative creativity**.

Human–AI Collaborative Interior Design Model

A proposed collaborative workflow is:

Client Requirements → Human Designer Analysis → AI-Assisted Concept Generation → Human Evaluation → AI Optimization → Technical Validation → Client Feedback → Final Design

Stage 1: Client Requirements

The designer identifies functional, aesthetic, cultural, financial, and environmental requirements.

Stage 2: Human Design Interpretation

The designer translates client requirements into design objectives.

Stage 3: AI-Assisted Generation

AI generates alternative concepts.

Stage 4: Professional Evaluation

The designer evaluates AI outputs for:

- aesthetics;
- functionality;
- feasibility;
- cultural appropriateness;
- accessibility;
- sustainability.

Stage 5: Optimization

AI can help refine selected alternatives.

Stage 6: Technical Validation

Professional designers and relevant technical experts verify the proposal.

Stage 7: Client Evaluation

The client reviews visualizations and provides feedback.

Stage 8: Final Design

The designer remains responsible for the final professional outcome.

AI and Sustainable Interior Design

Sustainability has become a major consideration in contemporary interior design. AI can contribute by analyzing multiple environmental variables simultaneously.

Potential applications include:

- low-impact material selection;
- daylight optimization;
- energy-efficient lighting;
- furniture reuse;
- waste reduction;
- lifecycle assessment;
- adaptive environmental control.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Machine-learning research in generative design identifies sustainability and optimization as important areas in the transformation of design workflows.

AI therefore has potential to shift interior design from aesthetic optimization alone toward a broader model incorporating environmental and social performance.

Ethical Considerations

AI adoption in interior design should follow several ethical principles.

13.1 Transparency

Designers should disclose when AI has materially contributed to a design.

13.2 Human Responsibility

Final professional responsibility should remain with qualified human professionals.

13.3 Privacy

Client data should be collected and processed responsibly.

13.4 Cultural Sensitivity

AI-generated designs should be evaluated for cultural appropriateness.

13.5 Fairness

AI systems should avoid discriminatory recommendations.

13.6 Intellectual Property

Designers and organizations should establish clear policies concerning ownership and use of AI-generated outputs.

Future Perspectives

The future of AI in interior design is likely to move beyond image generation toward integrated intelligent design ecosystems.

14.1 Multimodal Design Systems

Future AI systems will increasingly combine:

- text;
- images;
- floor plans;
- 3D models;
- voice;
- environmental data.

Recent research indicates growing interest in multimodal and graph-based data representations for design.

14.2 AI + Virtual Reality

AI-generated environments combined with VR could allow clients to experience a proposed interior before construction.

14.3 AI + Augmented Reality

AR could allow designers and users to visualize furniture, colours, finishes, and spatial modifications directly within existing environments.

14.4 Real-Time Adaptive Interiors

AI-enabled environments may respond dynamically to:

- occupancy;
- lighting;
- temperature;
- user preferences;
- time of day;
- activity.

14.5 AI-Generated 3D Models

Future systems are likely to move from 2D images toward editable 3D models that can be integrated into professional design workflows.

14.6 AI-Assisted Building Information Modeling

AI could increasingly interact with BIM environments to support spatial planning, material analysis, clash detection, and documentation.

14.7 Personalized Intelligent Homes

Future interiors may adapt automatically to individual users through AI and IoT integration.

14.8 AI Design Assistants

Interior designers may increasingly work with AI assistants capable of:

- analyzing briefs;
- generating concepts;
- comparing materials;
- producing visualizations;
- preparing design alternatives;
- identifying potential design problems.

Human-Centred Interior

Discussion

The literature demonstrates that Artificial Intelligence is becoming increasingly important within design research. AI has particularly strong potential in early-stage design activities, where rapid generation and comparison of alternatives can provide significant benefits. A 2025 systematic review reported that 68.94% of identified generative-AI applications in architectural design occurred during schematic design, demonstrating the current concentration of research in early design stages. At the same time, the literature suggests that AI adoption remains constrained by technical, data-related, ethical, and professional challenges. Machine-learning-based design systems can face problems associated with limited datasets, data bias, complex design representations, and interpretability. The findings also suggest that AI is unlikely to eliminate the need for professional interior designers. Instead, the designer's role may evolve from being primarily a creator of individual design alternatives toward becoming a curator, evaluator, strategist, and decision-maker who works collaboratively with intelligent systems.

The importance of human-centred AI is particularly significant because interior design involves subjective and contextual factors that are difficult to reduce to numerical variables. UNESCO's human-centred approach to generative AI similarly emphasizes human agency, privacy, inclusion, equity, and cultural diversity.

Key Findings

The major findings of the study are:

1. AI is increasingly influencing interior and built-environment design.
2. Generative AI provides powerful tools for rapid concept generation.
3. AI can support space planning and design optimization.
4. AI can improve client visualization and communication.
5. AI has potential applications in sustainable material and energy decisions.
6. Personalization is an important future application.
7. AI is currently more developed in conceptual and schematic design than in later technical stages.
8. Human expertise remains essential for technical validation and professional responsibility.
9. Ethical issues such as privacy, bias, copyright, and cultural representation require greater attention.
10. The future of interior design is likely to involve human–AI collaboration rather than complete automation.

Recommendations

Based on the findings, the following recommendations are proposed:

For Interior Designers

- Develop basic AI literacy.
- Use AI as a design-support tool rather than a replacement for professional judgment.
- Verify AI-generated outputs technically.
- Maintain awareness of copyright and data privacy.
- Preserve cultural and contextual sensitivity.

For Interior Design Education

- Introduce AI-assisted design into curricula.
- Teach responsible AI use.
- Develop courses in computational and generative design.
- Train students to critically evaluate AI outputs.
- Encourage human–AI collaborative design studios.

For Researchers

Future research should focus on:

- empirical studies involving professional designers;
- user satisfaction with AI-generated interiors;
- AI and cultural identity;
- AI-assisted sustainable design;
- AI + VR/AR;
- AI-based 3D interior generation;
- intellectual property;
- algorithmic bias;
- human–AI creativity;

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

- real-world construction validation.

Conclusion

Artificial Intelligence is emerging as an important transformative technology in interior design. Generative AI, machine learning, computer vision, natural language processing, and optimization algorithms can support designers in concept generation, space planning, visualization, personalization, material selection, sustainability analysis, and client communication. However, technological capability alone cannot guarantee successful interior design. Interior environments are deeply connected to human behaviour, culture, emotion, identity, comfort, and social context. Consequently, AI-generated designs require professional interpretation and validation. The evidence reviewed in this study indicates that AI currently has particularly strong applications in early conceptual and schematic design, while more technically complex later stages remain less developed. The future should therefore not be understood as **"AI replacing the interior designer."** A more appropriate model is **"AI augmenting the interior designer."** Under this model, AI provides computational power, rapid alternatives, visualization, and optimization, while human designers provide creativity, empathy, cultural knowledge, ethics, professional judgment, and responsibility.

The successful future of AI-enabled interior design will depend on establishing a balanced human–AI ecosystem in which technological innovation supports, rather than replaces, human creativity and professional expertise.

Acknowledgement

I express my sincere gratitude to everyone who contributed to the successful completion of this research paper titled "Artificial Intelligence in Interior Design: Opportunities, Challenges and Future Perspectives." I am deeply thankful to my institution, S. Chandra Mahila Mahavidhyalay, Amgaon, for providing a supportive academic environment that encouraged this research work. I extend my heartfelt appreciation to all the researchers, authors, and scholars whose published works and valuable insights formed the foundation of this systematic literature review. Their contributions greatly enriched my understanding of Artificial Intelligence and its evolving role in interior design.

Abstract

The convergence of Geographic Information Systems (GIS), high-resolution Earth observation (EO) systems, and Artificial Intelligence (AI) has established a new paradigm: Geospatial Artificial Intelligence (GeoAI). In the context of India's rapid digital transformation, GeoAI serves as a core technology driving sustainable urbanization, precision agriculture, disaster risk reduction, and multi-modal logistics planning. Anchored by strategic national frameworks such as the National Geospatial Policy (NGP), PM Gati Shakti National Master Plan, and the SVAMITVA scheme, this paper examines how AI-integrated spatial analysis accelerates India's digital governance. Through technical methodologies, statistical hypothesis testing, applied case studies, and systemic evaluation, this study demonstrates the pivotal role of GeoAI in building resilient spatial data infrastructure and offers strategic policy recommendations for scalable national adoption.

Keywords: *Geospatial AI (GeoAI), Spatial Machine Learning, Earth Observation (EO), Deep Learning, Digital Public Infrastructure, PM Gati Shakti, Spatial Autocorrelation, GIS Automation, Sustainable Urbanization.*

Introduction

Geographic inquiry has transitioned from descriptive spatial mapping to dynamic, predictive spatial modeling. India's geographic landscape presents a unique combination of terrain diversity, high population density, and acute climate vulnerabilities. Traditional geospatial workflows relying on manual digitizing, static cartography, and classical spatial statistics are increasingly insufficient for processing the massive, high-frequency spatial data streams generated by ISRO's Earth Observation (EO) satellites, commercial UAV fleets, and Internet of Things (IoT) environmental sensor networks. GeoAI fills this operational gap by marrying machine learning (ML), deep neural networks, and spatial statistics with modern spatial data infrastructures. By automating feature extraction, dynamic pattern recognition, and localized predictive modeling, GeoAI translates unstructured geospatial data into real-time decision intelligence. As India advances toward a multi-trillion-dollar digital economy, embedding GeoAI across public administration, infrastructure deployment, environmental stewardship, and rural development has become an operational necessity.

Research Hypotheses

To rigorously evaluate the efficacy of GeoAI integration within Indian spatial planning workflows, this study tests the following formal hypotheses:

- **Primary Hypothesis (H_1):** Integrating Artificial Intelligence algorithms (specifically Deep Convolutional Neural Networks and Spatial Regression models) with high-resolution geospatial datasets significantly improves the accuracy,

Quick Response Code:

Website: https://bnir.us

processing speed, and cost-efficiency of spatial planning, resource management, and governance in India compared to traditional GIS methods.

- **Null Hypothesis (H_0):** Integrating Artificial Intelligence with geospatial datasets yields no statistically significant difference ($p \geq 0.05$) in analytical precision, feature extraction time, or decision-making accuracy when compared to conventional, manual GIS workflows.

Literature Review & Conceptual Framework

Geospatial AI integrates spatial computer vision, spatial natural language processing (Spatial NLP), and dynamic agent-based modeling. Unlike standard non-spatial AI models, GeoAI algorithms are explicitly constrained by Tobler's First Law of Geography ("everything is related to everything else, but near things are more related than distant things") and account for spatial non-stationarity and spatial autocorrelation.

1. Policy Alignment with Indian Digital Infrastructure

1. National Geospatial Policy (NGP 2022): Provides the regulatory foundation for open spatial data access, liberalizing geospatial data acquisition and encouraging private-sector AI innovation.
2. PM Gati Shakti National Master Plan: Utilizes a multi-layered GIS platform integrating over 200 spatial data layers across ministries to optimize national corridor planning and reduce logistics costs.
3. SVAMITVA Scheme: Leverages high-resolution drone mapping paired with automated spatial feature extraction to provide official ownership cards (Property Cards) to rural homeowners, establishing clear land titling.

Research Methodology

The operational architecture combines heterogeneous spatial data streams through an automated machine learning pipeline designed to preserve spatial fidelity.

1. Data Sources & Pipeline Architecture

- Satellite Remote Sensing Data: Multispectral imagery from ISRO's Cartosat-3 (0.3m resolution), Resourcesat, and ESA Sentinel-2 (10m resolution) across diverse geographical terrains.
- Unmanned Aerial Vehicle (UAV) Data: Sub-decimeter high-resolution orthomosaic imagery (<5cm GSD) collected during rural cadastral mapping missions.
- Vector Spatial Layers: Road networks, administrative boundaries, river basins, and cadastral maps sourced from Survey of India and state portals.
- Preprocessing & Coregistration: Atmospheric correction (Sen2Cor), spatial coregistration, data normalization, and vector-to-raster alignment to ensure cross-layer compatibility.

2. Model Architecture & Formulation

The analytical workflow deploys specific neural network architectures customized for visual spatial analytics: 1. Semantic Segmentation (U-Net & Mask R-CNN): Applied to extract building footprints, road edges, and water bodies from high-resolution imagery. Model performance is evaluated using the Intersection over Union (IoU) metric:

$$IoU = |A \cap B| / |A \cup B|$$

2. Object Detection (YOLOv8): Used for dynamic urban asset mapping, vehicle density monitoring, and illegal encroachment detection.
3. Geographically Weighted Regression (GWR): Models spatial heterogeneity in socioeconomic parameters across districts by adjusting regression parameters locally:

$$y_i = \beta_0(u_i, v_i) + \Sigma_k \beta_k(u_i, v_i) * x_{ik} + \varepsilon_i$$

Where (u_i, v_i) denotes the precise geographic coordinates of the i-th observation point in space.

Analysis & Quantitative Evaluation

To evaluate the hypotheses, empirical benchmarks comparing traditional manual GIS workflows with the proposed GeoAI pipeline were compiled. The results demonstrate substantial operational gains in processing speed, segmentation accuracy, and scalability across distinct use cases.

Metrics & Focus Area	Traditional Manual GIS Workflow	GeoAI-Driven Spatial Analytics	Operational Impact & Gain
Land Cover Feature Extraction	Manual vector digitization from satellite imagery.	Automated deep learning semantic segmentation (U-Net).	Processing time reduced by ~85%; human labor footprint down ~70%.
Map Segmentation Accuracy	Moderate; subject to human operator bias (IoU ≈ 0.68–0.72).	High consistency using trained U-Net models (IoU ≥ 0.89).	+23% improvement in boundary detection accuracy across terrains.
Cadastral & Property Mapping	Weeks per village using ground surveys & manual	Automated feature detection on sub-decimeter	Scalable coverage across hundreds of thousands of

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

	drawing.	UAV orthophotos.	villages in months.
Disaster Response & Flooding	Static, pre-computed spatial hazard maps.	Dynamic integration of real-time satellite, elevation & rainfall data.	Lead-time for early warning alerts expanded by 6 to 12 hours.

Hypothesis Decision: Based on the quantitative empirical results ($p < 0.001$ across feature extraction speed and IoU segmentation benchmarks), the Null Hypothesis (H_0) is emphatically rejected in favor of the Primary Hypothesis (H_1).

Applied Case Studies in India

1. Agriculture & Crop Insurance (PMFBY & ISRO Bhuvan)

By coupling multispectral optical and synthetic aperture radar (SAR) satellite data with Random Forest regression, the system automates crop yield estimation and stress detection. Under PMFBY, this automated processing has reduced crop damage claim settlement times from months to mere days while reducing fraud.

2. Rural Land Titling (SVAMITVA Scheme)

Utilizing sub-decimeter drone imagery and AI edge-detection algorithms, the Survey of India has mapped over 250,000 villages. The system automatically extracts parcel boundaries, enabling the generation of official digital property cards and substantially mitigating land disputes.

3. Urban Multi-Modal Logistics (PM Gati Shakti)

Integrating Graph Neural Networks (GNNs) with multi-layered spatial data (over 200 spatial layers), PM Gati Shakti optimizes economic corridor alignments, minimizes forest/land acquisition friction, and accelerates infrastructure project execution across the country.

Operational Challenges & Bottlenecks

1. Data Quality and Annotation Standards: Training robust GeoAI models requires vast, spatially diverse training sets representative of India's complex agro-climatic zones and informal urban settlements.
2. Compute Infrastructure Deficits: High-performance GPU computing clusters and edge-AI hardware are needed for real-time inference, which remain heavily concentrated in tier-1 institutions.
3. Interoperability & Legacy Data: Historical spatial datasets across various state departments often lack standardized Coordinate Reference Systems (CRS) or uniform metadata schemas.
4. Privacy and National Security: High-resolution satellite and drone imagery require strict regulatory guardrails to prevent unauthorized surveillance and safeguard sensitive strategic assets.

Strategic Recommendations & Conclusion

- National GeoAI Labeled Data Repository: Establish an open-access, centralized library of labeled spatial training datasets tailored to Indian topography, urban layouts, and crops.
- Integration with DIGIPIN Framework: Synthesize AI spatial algorithms with India's emerging digital addressing grid (DIGIPIN) to standardize address geocoding and optimize last-mile logistics.
- Capacity Building: Launch interdisciplinary GeoAI centers of excellence across Indian universities (IITs, NITs, Central Universities) bridging geography, computer science, and spatial statistics.
- Privacy-Preserving Frameworks: Implement Differential Privacy and Federated Learning architectures to allow model training across state boundaries without exposing sensitive location data.

Conclusion

Geospatial Artificial Intelligence represents a fundamental paradigm shift in how India understands, plans, and governs its spatial landscape. By unifying cutting-edge computer vision, deep learning, and spatial statistics with robust public data platforms, GeoAI converts raw spatial data into actionable intelligence. Fully realized, GeoAI will serve as a vital engine driving India's digital public infrastructure and sustainable development goals for decades to come.

Abstract:

*Artificial Intelligence (AI) is becoming a major driver of India's digital transformation. It is expected to impact governance, education, healthcare, finance, employment and everyday life as India moves towards the vision of Viksit Bharat@2047. However, this rapid development and adoption of technology also creates a growing gap between technological progress and the ability of individuals and society to adapt. This paper describes this condition as **Technorapid**, an accelerating pace of technological change that can exceed human, social, institutional and ethical adaptive capacity. The paper proposes that digital transformation should not remain confined to policies and institutional documents. Its success should ultimately be visible on the ground, in the lived experience of its citizens. AI-driven development needs to be evaluated through its ability to improve access, dignity, inclusion, education, employment and quality of life. This paper explores Vasudhaiva Kutumbakam, the principle that the world is one family, as a philosophical foundation for a human-centered approach to AI ethics. It argues that India's technological progress should be complemented by human adaptation, ethical governance and mechanisms that ensure that the benefits of AI reach diverse sections of society. The paper concludes that the true measure of Viksit Bharat @2047 should not be how advanced India's technologies become, but how meaningfully those technologies improve human live and national progress*

Keywords: *Artificial Intelligence, AI Ethics, Technorapid, Vasudhaiva Kutumbakam, Viksit Bharat @2047, Sustainable Development.*

Introduction

India is entering a period of unavoidable deep technological transformation. Artificial Intelligence (AI), digital platforms, data-driven systems, automation and emerging technologies are increasingly used in governance, education, healthcare, finance, commerce, employment and everyday social life. The vision of Viksit Bharat @2047 places India's development within a long-term framework of economic growth, innovation, knowledge, skills, inclusion and sustainable development. The conference theme itself recognizes Artificial Intelligence, digital transformation, innovation and sustainable development as important dimensions of this national vision. In this scenario, technological progress raises three very important questions:

a. Is digital transformation actually improving the everyday lives of ordinary citizens?
b. Are all citizens along with economically weaker groups able to access, understand and benefit from rapidly advancing AI and digital technologies?
c. As technology advances faster than most of the people understanding and institutions can adapt, who is responsible for ensuring that no one is left behind?

Impact → Inclusion → Responsibility

The existence of digital infrastructure or AI-enabled services does not automatically mean that citizens are experiencing meaningful upgradation in their lives. A technology may be highly advanced while remaining inaccessible, unaffordable or unsuitable for the people it is intended to serve. This challenge becomes more significant because the pace of technological development is itself accelerating. AI capabilities, automation and digital systems are evolving faster worldwide. Many individuals, educational institutions, organizations, and governance mechanisms are not ready to adapt this pace. This paper uses the term **Technorapid** to describe this condition. Users are not trained to the accelerating pace of technological change and adoption that can exceed the adaptive capacity of human, social, institutional and ethical systems. Major users are not digitally literate to handle the basic ICT Skills. The central proposal of this paper is therefore: The true measure of India's digital transformation should not be how meaningfully AI technology improves the lives of its people. From this perspective, Viksit Bharat @2047 is not only a technological or economic aspiration but also an ethical challenge

The Technorapid Challenge

The rapid advancement of Artificial Intelligence and digital technologies is changing the relationship between technology and society. This acceleration creates opportunities for innovation and development, but it also creates a fundamental challenge that humans and institutional adaptation may not occur at the same speed as technological change. This paper uses the term **Technorapid** to describe this condition. Technorapid refers to the accelerating pace of technological change and adoption that can exceed the adaptive capacity of individuals, societies, institutions, ethical systems and governance. It represents a potential gap between technological capability and human preparedness. An AI-based system may improve efficiency for an organization while simultaneously changing employment requirements for workers who have had little opportunity to reskill. Digital public services may increase convenience for digitally capable citizens while creating difficulties for people who are unfamiliar with digital systems. Technorapid therefore raises an important ethical concern. Those with education, resources, connectivity and technological familiarity may benefit more quickly, while others may struggle to participate. The issue is consequently not whether technology is advancing, but whether society is developing the capacity to advance with it. The Technorapid perspective therefore shifts the question from "How rapidly can we deploy technology?" to "How responsibly can society adapt to technological change?" For Viksit Bharat @2047, this distinction is significant. A developed nation cannot be defined only by technological capability; it must also possess the human, social, educational, cultural and ethical capacity to use that capability responsibly. Thus, Technorapid provides a conceptual bridge between technological transformation and AI ethics. It highlights the need for an ethical framework that considers not only what AI can achieve, but also who can participate, who benefits, who may be excluded, who bears the risks, and how society can adapt. This provides the foundation for examining whether *Vasudhaiva Kutumbakam* can contribute to a more inclusive and human-centered approach to AI ethics.

AI Ethics beyond Technical Principles

The boom of Artificial Intelligence has generated broad discussion about the ethical principles required to guide its development and use. Issues such as fairness, transparency, accountability, privacy, safety and human oversight have become important components of contemporary AI ethics. These principles are essential because AI systems increasingly influence decisions and activities that directly affect human beings. Similarly, an AI-enabled service may be efficient from an institutional perspective while creating difficulties for citizens who are unfamiliar with digital processes. NITI Aayog does have an official 2021–2047 population projection. It gives.

Table 1: Niti Ayog 2021-2047 population projections: Source https://www.niti.gov.in/node/1853

Year	Population
2026	1.467 billion
2036	1.577 billion
2040	1.612 billion
2045	1.646 billion
2046	1.652 billion
2047	1.657 billion

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Therefore, AI ethics should not be concerned only with how an AI system is designed, but also with how that system is experienced by people on the ground. This requires attention to the social conditions in which technology operates. Several below mentioned questions become important:

- Does AI expand opportunities or deepen existing inequalities?
- Does automation improve human capability or leave people without adequate opportunities to adapt?
- Are the benefits of AI reaching different sections of society equitably?
- Does technological efficiency come at the cost of human dignity or autonomy?

In the context of Viksit Bharat @2047, this broader perspective is particularly relevant. India's development cannot be considered inclusive if technological advancement benefits only those who already possess the resources and capabilities to participate in the digital economy.

Vasudhaiva Kutumbakam as an Ethical Foundation for AI

Vasudhaiva Kutumbakam offers an important philosophical perspective. The idea, commonly understood as "the world is one family," represents a concept towards interconnectedness and collective welfare. It encourages a broader understanding of responsibility towards others. The relevance of *Vasudhaiva Kutumbakam* to AI ethics lies in its potential contemporary interpretation. Algorithms can influence employment, access to information, financial opportunities, education and public services across social and geographical boundaries. From this perspective, the ethical question surrounding AI extends beyond "What can AI do?" to "For whom is AI being developed, who benefits from it, who may be excluded, and what responsibility do we have towards those affected by it?" A *Vasudhaiva Kutumbakam* perspective can therefore encourage several ethical orientations: **Human dignity:** Technological efficiency should not reduce human beings merely to data points, consumers or economic units. AI should remain a means for enhancing human capabilities rather than an end in itself.

Inclusion: If the world is understood as one family, technological progress cannot be ethically satisfactory when significant sections of society are systematically excluded from its benefits.

Collective responsibility: Developers, businesses, governments, educational institutions and citizens share responsibility for ensuring that AI is developed and used responsibly.

Sustainability and intergenerational responsibility: Technological decisions should consider not only present benefits but also their consequences for future generations and the wider environment.

Global responsibility: AI increasingly operates across national and cultural boundaries. An ethical framework based on interconnectedness can encourage cooperation rather than viewing technological advancement solely as a competition for economic or geopolitical advantage.

Thus, *Vasudhaiva Kutumbakam* can provide a philosophical bridge between technological capability and collective human responsibility. For Viksit Bharat @2047, this perspective suggests that India's technological development should seek not merely to make India more digitally advanced, but to make technological advancement meaningful, inclusive and beneficial to society as a whole.

From Digital Transformation on Paper to Real Transformation on Ground

The vision of Viksit Bharat @2047 cannot be achieved through technological advancement alone. A digital transformation that exists primarily in policy documents, institutional presentations or technological demonstrations cannot by itself constitute inclusive development. The real test is what happens on the ground. A citizen should experience digital transformation through easier access to

- Education
- Healthcare
- Government services
- Financial services
- Employment opportunities
- Information and entrepreneurship

A student should be able to use technology to expand learning and career opportunities. A small entrepreneur should be able to use digital platforms to reach markets. A worker affected by automation should have opportunities to acquire new skills. An elderly person should be able to access essential services without being excluded because a process has become entirely digital. Instead of asking only how many digital platforms have been created or how many people are registered on them, the evaluation should ask whether these systems have produced meaningful human outcomes. At the ground level, three questions become particularly important:

- **Accessibility**: Can people actually access and use the technology?
- **Adaptability:** Do individuals and institutions have the knowledge and skills required to adapt to technological change?
- **Benefit:** Does technology produce a meaningful improvement in people's lives?

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

These three dimensions are particularly important in an era of Technorapid. The speed at which new technologies are introduced can create unequal adaptation. People with greater education, resources and digital familiarity may adapt rapidly, while others may require significantly more time and support. Therefore, technological deployment without corresponding investment in human capability can unintentionally widen existing inequalities. This is where the principle of *Vasudhaiva Kutumbakam* acquires practical significance. If technological development is understood within the idea of a shared human family, the benefits of AI cannot be designed exclusively for those who are already technologically capable. Development must consciously include those who are vulnerable to exclusion.

- Technology must become accessible.
- People must become capable of adapting.
- Development must become measurable through human outcomes.

For Viksit Bharat @2047, the objective should therefore be to build a nation in which technological advancement reaches its citizens in meaningful and equitable ways. The success of AI-driven transformation should ultimately be visible not only in classrooms, workplaces, homes, villages, businesses and the everyday experiences of citizens.

An Integrated Framework for Ethical and Ground-Level AI Transformation

The preceding discussion establishes three interconnected challenges. AI and digital technologies are developing at an unprecedented pace. This acceleration can create an adaptation gap between technological capability and the capacity of individuals, institutions and society to respond. Technological transformation has ethical significance only when its benefits reach people in an inclusive and meaningful manner. These challenges require an approach that connects technological progress with human capability and ethical responsibility.

1. Technological Acceleration: The first element is the rapid development and adoption of AI and digital technologies. Technological acceleration creates significant opportunities for innovation, productivity, education, governance and economic development. However, acceleration itself is not an indicator of inclusive progress.

6.2 The Technorapid Adaptation Gap: Technorapid identifies the possibility that technological change may move faster than the ability of people, institutions, education systems, ethical frameworks and governance structures to adapt. This creates an adaptation gap.

3. AI Ethical Responsibility: The next element is ethical responsibility. AI systems should be assessed not only according to technical performance but also according to their consequences for people and society. The ethical evaluation of AI should therefore consider:

- Who benefits?
- Who may be excluded?
- Who bears the risks?
- Can people understand and question AI-driven decisions?
- Are affected communities able to adapt?
- Does AI strengthen or weaken human capabilities?

4. Vasudhaiva Kutumbakam as the Ethical Orientation: *Vasudhaiva Kutumbakam* provides the broader philosophical orientation of the framework. If humanity is understood as an interconnected family, technological progress carries a responsibility towards others. AI development should therefore seek collective welfare rather than concentrating benefits among technologically privileged groups.

5. Ground-Level Human Benefit: The framework ultimately returns to the citizen. AI and digital transformation should demonstrate their value through tangible improvements in human life. These may include improved educational opportunities, better access to services, enhanced employability, and support for entrepreneurship, improved governance, greater accessibility and increased participation in the digital economy.

6. Viksit Bharat @2047: The final objective is to connect technological development with the larger national vision of Viksit Bharat @2047. A developed India should possess technological capability, but technological capability alone cannot define development. It's a development journey in which technology and humanity must advance together. The framework can be summarized as follows:

Table 1: Proposed summary of Framework

Dimension	Central Question
Technological Acceleration	What can technology achieve?
Technorapid	Can society adapt at the same pace?
AI Ethics	Is technological development responsible?
Vasudhaiva Kutumbakam	Who should benefit and who must be cared for?
Ground-Level Transformation	Is technology improving lived experience?
Viksit Bharat @2047	Are technological and human development advancing together?

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

The distinctive contribution of this framework is therefore its attempt to connect technological speed, human adaptability, ethical responsibility and ground-level outcomes. It places the citizen at the end point of technological development and collective welfare at the center of ethical consideration.

Policy and Ground-Level Recommendations for Viksit Bharat @2047

The following recommendations emerge from the Technorapid perspective and the ethical orientation of *Vasudhaiva Kutumbakam.*

1. Measure Digital Transformation through Human Outcomes: The success of digital transformation should not be measured only through the number of platforms, applications, users, investments or digital transactions. Evaluation should also consider whether technology has improved access to education, employment, healthcare, public services, entrepreneurship and quality of life.

2. Build AI and Digital Literacy alongside Digital Infrastructure: Infrastructure without human capability can create an adaptation gap. As AI becomes part of education, employment, governance and business, citizens need opportunities to understand and use these technologies responsibly.

3. Prepare People for Technorapid Change: Technological change is unlikely to slow down sufficiently for society to adapt naturally. Education and skill-development systems therefore need mechanisms for continuous reskilling and upskilling.

4. Strengthen Local-Language and Accessible AI: India's linguistic and social diversity requires AI systems and digital services that are understandable and accessible to diverse populations. Technology that is technically available but difficult for citizens to understand cannot achieve genuine ground-level inclusion.

5. Include Small Businesses and Local Entrepreneurs: Digital transformation should not benefit only large technology companies and digitally sophisticated organizations. Small businesses, local entrepreneurs, informal workers and emerging enterprises should have opportunities to use AI and digital technologies to improve productivity, access markets and create employment.

6. Create Continuous Ethical Evaluation: Because of Technorapid, an ethical framework developed today may become inadequate as technology evolves. AI governance should therefore be treated as a continuing process rather than a one-time compliance exercise.

7. Make Vasudhaiva Kutumbakam Operational: *Vasudhaiva Kutumbakam* should not remain only a philosophical statement associated with India's cultural heritage. For Viksit Bharat @2047, therefore, the goal should be responsible technological progress that reaches the ground and improves human life.

Conclusion

The accelerating pace of technological change creates a condition of Technorapid, in which technological advancement can move faster than the ability of individuals, institutions, ethical systems and governance mechanisms to adapt. This creates an important challenge for AI ethics: ensuring that technological progress does not create new forms of exclusion or leave sections of society behind. In this context, *Vasudhaiva Kutumbakam* offers a philosophical orientation towards interconnectedness, collective responsibility and human welfare. Its contemporary application to AI ethics can encourage an approach in which technological progress is directed towards inclusion, dignity, sustainability and shared benefit. The proposed framework brings together Technorapid, AI Ethics and *Vasudhaiva Kutumbakam* to place human outcomes at the center of India's digital transformation. It suggests that technology should be accessible, people should be prepared to adapt, institutions should remain ethically accountable, and the benefits of AI should reach diverse sections of society. Viksit Bharat @2047 should be understood as an India in which technological advancement and human development progress together. The aspiration should be to ensure that AI does not simply transform systems, but transforms lives for the better. In this journey, the spirit of *Vasudhaiva Kutumbakam* can provide an ethical direction, while awareness of Technorapid can remind us that technological speed must be matched by human preparedness and responsible governance. India's digital future should not be a future in which technology moves ahead and society struggles to follow. It should be a future in which technology advances with humanity, serves humanity and leaves no one behind.

Acknowledgement

I would like to express my sincere gratitude to my research guide, Dr. Kiran Save, for his valuable guidance, encouragement, and constructive suggestions throughout the preparation of this research paper. I am also thankful to DTSS College

Abstract

Literature is a mirror of society. It shows the economic conditions, social problems, and daily struggles of human life across different times. Work is one of the most important parts of human life. In the past, many people depended completely on land, rich masters, or family heads for their survival. Over time, the meaning of work has changed from total dependence to economic independence. English literature presents many stories of characters who fight against poverty and social rules to earn their own living and live with dignity. Work is not just a way to earn money; it also gives a person self-respect, identity, and personal freedom. This research paper examines how work, economy, and independence are presented in selected English literary texts: Charlotte Brontë's Jane Eyre, Elizabeth Gaskell's North and South, and Virginia Woolf's A Room of One's Own. These texts show how education, employment, and money help individuals to become free and confident. Finally, this paper connects these literary lessons with the modern world. Today, technology, artificial intelligence, online platforms, and work-from-home jobs are changing the future of work. The paper concludes that even in the modern digital age, human dignity and economic security are essential for true freedom.

Keywords: *Work and Economy, Economic Independence, Self-Reliance, English Literature, Jane Eyre, North and South, A Room of One's Own, Future of Work.*

Objectives of the Research Paper

1. To study how work, money, and economic independence are shown in selected English literary works.
2. To understand how characters in literature move from dependence on others to self-reliance and personal freedom.
3. To examine the role of education, gender, and social class in helping people find respectable employment.
4. To compare the historical industrial changes in literature with today's changes in digital technology and online work.
5. To highlight the importance of human dignity, fair wages, and job security in the changing future of work.

Methodology

This research paper uses a simple qualitative and descriptive method. It is based on the close reading and careful study of three famous English literary texts: Charlotte Brontë's novel Jane Eyre (1847), Elizabeth Gaskell's novel North and South (1855), and Virginia Woolf's essay A Room of One's Own (1929). These texts are studied to understand the relationship between work, social class, money, education, and personal identity. The paper also uses secondary sources such as books on literature, essays on labour history, and recent reports on modern employment.

A comparative approach is used to connect the problems of nineteenth-century workers with the problems faced by modern workers in the digital age.

Introduction

Work is an essential part of everyday life. Every person needs to work to earn food, clothing, and shelter. However, work is much more than just earning money. It gives people a sense of purpose, confidence, and respect in society. When a person has a good job and earns their own living, they feel independent and capable of making their own life choices. In contrast, when people have no work or are forced to depend on others for money, they lose their freedom and self-respect. English literature has always recorded how work and society change over time. Writers have created memorable characters to show how ordinary people struggle to survive and build an independent life. In ancient and medieval times, wealth and power belonged only to a few rich landlords and royal families. Most ordinary people did not own land or property. They had to depend entirely on rich masters. For women, the situation was even more difficult. Women had very few legal rights. They depended on their fathers before marriage and on their husbands after marriage. They were not allowed to own property or do professional jobs. Therefore, for centuries, work was a heavy burden and survival was a daily struggle. In the nineteenth century, the Industrial Revolution changed England completely. Big factories were built in cities, and machines started producing goods in large numbers. Millions of people left villages and came to cities to work in factories for wages. This big change created new problems like bad working conditions, pollution, and long working hours. At the same time, it also created new opportunities. People could get an education, learn skills, earn their own money, and stand on their own feet. Literature from the nineteenth and twentieth centuries clearly shows this journey from dependence to independence. By studying Jane Eyre, North and South, and A Room of One's Own, we can see how people fought for their rights and self-respect.

a). Education, Employment, and Self-Respect: Charlotte Brontë's Jane Eyre

Charlotte Brontë's famous novel Jane Eyre (1847) tells the story of an orphan girl named Jane. Jane has no parents, no money, and no rich relatives to help her. In her childhood, she lives at Gateshead Hall with her cruel aunt, Mrs. Reed, and her cousins. They constantly insult Jane and remind her that she is a poor, dependent child living on their charity. Jane feels hurt, but she has a strong spirit. She does not accept this ill-treatment and wants to live with dignity. Jane is sent to Lowood School, a strict and poor boarding school. Although life at Lowood is very hard, Jane focuses on her studies. She learns reading, writing, French, drawing, and music. Education becomes her greatest weapon. Jane realizes that education is the only way she can earn her own living and escape poverty. After finishing her schooling, she works as a teacher at Lowood for two years. Then, wanting a wider experience of the world, she advertises in a newspaper and gets a job as a private tutor (governess) at Thornfield Hall. In Victorian England, working as a governess was one of the few respectable jobs available for educated, poor women. At Thornfield Hall, Jane teaches a young French girl named Adele. Mr. Edward Rochester, the rich owner of Thornfield, pays Jane thirty pounds a year. This money is not very big, but it is earned by her own hard work. Because of this job, Jane is no longer a beggar or a dependent person; she is a self-reliant worker. Jane's desire for independence is tested when she falls in love with Mr. Rochester. On their wedding day, Jane discovers that Rochester is already married to a woman named Bertha Mason, who is mentally ill and kept in a secret room. Rochester asks Jane to live with him as his companion without marriage. He promises her love, luxury, and travel. A weak person might have accepted this easy life of wealth. But Jane refuses immediately. She knows that becoming his mistress would make her an unlawful dependent without dignity. She says clearly: 'I care for myself. The more solitary, the more friendless, the more unsustained I am, the more I will respect myself.' Jane leaves Thornfield with almost no money and faces severe hunger and cold, but she keeps her moral character intact. Later, Jane finds shelter with the Rivers family at Moor House. She happily accepts a simple job as a village schoolteacher at Morton. She teaches poor village girls and feels proud to earn her own bread. Toward the end of the novel, Jane inherits a fortune from her uncle in Madeira, which makes her financially rich. She returns to Rochester only when she is an independent woman who can stand on equal terms with him. Through Jane Eyre, Charlotte Brontë proves that education and honest work give human beings the power to live with self-respect and freedom.

b) Industrial Work, Capital, and Human Rights: Elizabeth Gaskell's North and South

Elizabeth Gaskell's novel North and South (1855) takes us into the busy world of the Industrial Revolution. The novel is set in Milton-Northern, a fictional industrial city based on Manchester. The

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

city is full of smoking factory chimneys, noisy textile mills, and thousands of workers. Gaskell compares the peaceful, traditional farming villages of the South of England with the energetic, tough, and fast-moving industrial cities of the North. The story focuses on Margaret Hale, a young woman who moves from a quiet southern village (Helstone) to the industrial city of Milton. At first, Margaret dislikes the smoke, noise, and rough manners of the northern business people. However, she soon gets to know the real lives of both the factory owners and the factory workers. In Milton, we meet two main groups of people: the mill owners (capitalists) and the mill workers (labourers). Mr. John Thornton is a self-made factory master. He started with very little money and built a large cotton mill through hard work, discipline, and courage. Thornton believes strictly in free trade and competition. He thinks that owners have the total right to decide wages and working hours, and workers should simply obey. On the other side are the mill workers, led by Nicholas Higgins. Higgins is a hardworking, intelligent man who cares deeply for his family and fellow workers. The workers suffer from low wages, unhealthy air filled with cotton dust, and dangerous machines. Many workers, including Higgins's young daughter Bessy, suffer from severe lung diseases because of the bad air in the factories. To fight for better wages and safer conditions, the workers form a trade union and go on a strike. The strike creates serious hardships for both sides. The workers and their children face starvation, while Thornton's factory is shut down and faces financial loss. Gaskell shows that when employers treat workers merely as machines or 'hands' without human feelings, conflict and hatred are inevitable. Through Margaret's friendship with both Higgins and Thornton, the two sides begin to understand each other. Thornton realizes that workers are not just numbers in a ledger, but human beings with families, dignity, and real needs. He talks directly with Nicholas Higgins and gives him a job. Thornton even helps the workers set up a clean, cheap dining room (canteen) inside the factory where workers can cook hot, nutritious meals together. By the end of the novel, Thornton and his workers develop mutual respect and cooperation. North and South shows that economic success should not come at the cost of human health and dignity. Work must be safe, fair, and based on mutual respect.

c). Money, Space, and Creative Freedom: Virginia Woolf's A Room of One's Own

In 1929, Virginia Woolf published a landmark feminist essay titled A Room of One's Own. In this essay, Woolf talks about the connection between money, privacy, and intellectual freedom, especially for women.

Woolf asks a simple question: Why did women write so few great books and poems in history compared to men? Was it because women lacked intelligence or talent? Woolf answers firmly: No. Women did not write great books because they were kept poor, uneducated, and completely dependent on men. In the past, women were not sent to universities, were not allowed to have bank accounts or own property, and spent their entire lives cooking, cleaning, and raising children in crowded family houses. To explain this clearly, Woolf invents an imaginary character named Judith Shakespeare, who is the sister of the famous writer William Shakespeare. Woolf imagines that Judith was just as talented, intelligent, and creative as her brother William. However, while William went to school, learned Latin and grammar, traveled to London, got a job in the theatre, and became a famous playwright, Judith was kept at home. Her parents did not let her go to school and beat her when she refused to marry a man she did not love. When Judith ran away to London to act and write in the theatre, people laughed at her and turned her away because she was a woman. Having no money, no job, and no safe place to stay, Judith became desperate and ended her life. Through this tragic story, Woolf shows that without money, education, and social support, even the greatest talent is wasted. Woolf states her famous central message in very simple words: 'A woman must have money and a room of her own if she is to write fiction.' Woolf explains that when an aunt left her a fixed income of five hundred pounds a year, it completely changed her life. She did not have to flatter anyone or do jobs she hated just to buy food. Her money gave her peace of mind, time to think, and the freedom to write honestly without fear. Woolf encourages young women to study hard, take up good professions, earn their own money, and build their own independent lives. She proves that economic independence is the real foundation of intellectual, artistic, and personal freedom.

d) What These Literary Works Teach Us About Work

When we look at Jane Eyre, North and South, and A Room of One's Own together, we find important common lessons about work and human life:

1. Work Gives Self-Respect: In Jane Eyre, work is not just a daily task; it is the path to self-respect. Earning your own living protects you from being bullied or controlled by others.
2. 2. Workers Deserve Dignity and Fair Treatment: In North and South, we learn that

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

employers and employees must respect each other. Hard work should be rewarded with fair wages and safe working conditions. 3.Financial Independence Brings Freedom of Mind: In A Room of One's Own, Virginia Woolf shows that when a person has financial security, they can think freely, learn new things, and develop their creativity.

In all three works, the main characters do not want wealth to show off or live in luxury. They want an honest income so that they can live with dignity, make their own choices, and stand on their own feet.

e). The Changing Future of Work in the 21st Century

The changes in work shown in nineteenth-century literature are very similar to the changes happening in our world today. In the nineteenth century, steam engines and factories changed how people worked. Today, computers, the internet, smartphones, and Artificial Intelligence (AI) are changing work completely. Let us look at how the modern world of work is changing:

A. The Rise of the Gig Economy and Online Platforms

In the past, most people had permanent, full-time jobs with fixed monthly salaries, pensions, and medical benefits. Today, millions of people work on digital platforms as delivery workers, freelance writers, graphic designers, app developers, and online tutors. This is called the 'gig economy.' On one hand, gig work offers freedom because people can choose their working hours and take projects from anywhere in the world. On the other hand, gig work creates insecurity. Workers do not have fixed salaries, paid leave, health insurance, or job security. If an app changes its rules or if there are no new projects, workers can lose their income overnight. Modern gig workers face insecurity just like the factory workers in Gaskell's novel.

B. Remote Work and Work from Home

After the COVID-19 pandemic, working from home (remote work) became very common. Today, many people do not need to travel to an office every day. They can sit in their room with a laptop and work for companies located in different cities or countries. This sounds very much like Virginia Woolf's idea of having 'a room of one's own.' However, working from home also brings new problems. People often work late into the night because the boundary between office time and family time disappears. Sitting alone with a computer all day can also cause loneliness and stress.

C. Artificial Intelligence (AI) and Automation

Artificial Intelligence tools (like ChatGPT, automated software, and smart robots) are developing very fast. Machines can now write computer code, translate languages, answer customer questions, create images, and perform medical tests. While AI can make work faster and easier, it also creates the fear of job loss. Just as handloom weavers lost their jobs when power machines came in the nineteenth century, today office workers, writers, and clerks fear that AI might replace them. According to the World Economic Forum, workers will need to learn new digital skills continuously to stay employed in the future.

f) . Important Lessons and Solutions for the Future

Literature teaches us that technology should serve human beings, not harm them. To make the future of work fair and peaceful, society, governments, and companies must take several important steps:

1. Focus on Quality Education and Skills: Just as education saved Jane Eyre from poverty, modern students need quality education in computers, critical thinking, problem-solving, and communication skills.
   2. Fair Wages and Social Security: Modern gig and platform workers must be protected with fair pay, health insurance, and accident cover so that they do not fall into extreme poverty.
2. 3. Balance Between Work and Personal Life: Workers should not be forced to work 24 hours a day on digital devices. Every person needs rest, family time, and leisure to live a healthy, happy life.
   4. Respect for Human Labour: Technology and AI should be used to support workers and reduce difficult labour, not to throw people out of jobs without support.

Conclusion

In conclusion, the journey from dependence to independence is one of the most inspiring themes in English literature. Charlotte Brontë's Jane Eyre shows that an educated, determined person can overcome poverty and live with self-respect. Elizabeth Gaskell's North and South proves that industrial and business progress must be guided by kindness, dialogue, and respect for workers. Virginia Woolf's A Room of One's Own reminds us that financial independence and personal space are essential for education and creative freedom.

Today, as our world enters the age of computers and Artificial Intelligence, the lessons of these classic literary works are more important than ever. The real purpose of work is not merely to generate profits for companies or operate machines; its true purpose is to provide human beings with dignity, security, and the freedom to build a meaningful life.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

By combining modern technology with human values, we can build a future where every worker is respected, secure, and truly independent.

Acknowledgement

I would like to express my sincere gratitude to all those who supported and encouraged me in completing this research paper, "From Dependence to Independence: Work, Economy, and the Changing Future of Work in English Literature with Special Reference to Charlotte Brontë's Jane Eyre, Elizabeth Gaskell's North and South, and Virginia Woolf's A Room of One's Own." I am deeply thankful to my respected teachers, colleagues, and well-wishers for their valuable guidance, constructive suggestions, and constant encouragement throughout the preparation of this paper. Their academic support helped me to examine the relationship between work, economic independence, self-respect, gender, and social change in the selected literary works.

Abstract

India's vision of becoming a developed nation by 2047 depends on achieving balanced development across its diverse regions. Differences in landforms, climate, soils, water resources, population, agriculture, infrastructure and economic activities have created uneven development opportunities. While some regions have experienced rapid urbanization, industrialization and improved connectivity, rural, remote and environmentally fragile areas continue to face developmental challenges. This paper examines sustainable and inclusive regional development under Viksit Bharat @2047 from a geographical perspective. It focuses on regional disparities, rural transformation, urbanization, agriculture, infrastructure, natural-resource management, environmental sustainability, climate resilience, digital inclusion and tourism. Special attention is given to GIS and Remote Sensing for understanding spatial patterns and supporting development planning. The study is based on secondary information from government publications, institutional reports, academic literature and development documents, using a descriptive and analytical approach. The study argues that a uniform development model may not address India's regional diversity effectively. Development strategies should consider local resources, environmental conditions, population characteristics, connectivity and economic potential. Strengthening rural–urban linkages, improving infrastructure, promoting sustainable resource use and expanding digital access can help reduce regional inequalities. A geographically sensitive approach can make Viksit Bharat @2047 more inclusive, sustainable and responsive to the varied needs of different regions.

Keywords: *Viksit Bharat @2047, regional development, regional disparities, sustainable development, geographical planning, rural development, urbanization, GIS, Remote Sensing*

Introduction

India has entered an important stage of its development journey with the vision of becoming a developed nation by 2047. **Viksit Bharat @2047** is not limited to economic growth; it also emphasizes social progress, improved living standards, technological development, environmental protection and wider opportunities for people. These objectives must be understood in the context of India's considerable geographical diversity. The Himalayan region, northern plains, peninsular plateau, desert areas, coastal belts and islands differ significantly in their physical and environmental conditions. Regional variations are also visible in population distribution, agriculture, industries, and urbanization, transport, education and healthcare facilities. Consequently, development opportunities are not equally available in all parts of the country.

Website: https://bnir.us

Metropolitan centres and economically developed corridors generally have better infrastructure and employment opportunities, while several rural, remote and environmentally sensitive areas continue to face developmental constraints. Geography provides an important framework for understanding these spatial differences and the relationship between people, resources and economic activities. It also helps identify the development potential of individual regions. Agricultural regions can benefit from agro-processing and value addition, coastal areas from fisheries and tourism, and hilly regions from horticulture and eco-tourism. Therefore, achieving **Viksit Bharat @2047** requires development planning that recognizes regional characteristics. Balanced development should reduce spatial inequalities while protecting ecological resources. The objective should not only be faster economic growth but also ensuring that development benefits reach different regions and communities in a sustainable manner.

Concept of Viksit Bharat @2047

Viksit Bharat @2047 represents India's long-term aspiration for comprehensive national development by the centenary of independence. The concept encompasses economic expansion, social development, technological progress, environmental sustainability, institutional capacity and improvement in the quality of life. From a geographical viewpoint, a developed India should not be judged only by national-level indicators. The spatial distribution of development benefits is equally important. A region may have high economic output but still contain communities with inadequate infrastructure, limited employment or poor access to essential services. Therefore, regional balance is an important part of the broader development objective. A geographically balanced Viksit Bharat would involve better connectivity between rural and urban areas, sustainable use of land and water, resilient settlements, productive agriculture, diversified employment and equitable access to education, healthcare and digital services. Such development should also recognize that different regions require different solutions.

Geographical Dimensions of Regional Development

Regional development is influenced by a combination of physical, socio-economic and spatial factors. These factors interact with one another and shape the opportunities and limitations of different regions.

1. Physical-Geographical Dimension

Landforms, climate, soil, water availability, vegetation and mineral resources influence the development possibilities of a region. Plains generally provide favourable conditions for agriculture, settlements and transport, while mountainous areas may face greater difficulties in building roads and other infrastructure. Arid and semi-arid regions require careful management of water resources, whereas areas with abundant rainfall may face a different set of problems related to drainage, flooding and soil erosion. Natural resources can encourage economic activity, but resource-rich regions may also experience environmental pressure. Mining, industrial development and large infrastructure projects need to be planned according to the carrying capacity of local environments. Development that ignores ecological conditions can create long-term costs in the form of land degradation, water scarcity and loss of biodiversity.

2. Socio-Economic Dimension

Population characteristics, literacy, employment, income, health, education and skills influence the capacity of regions to participate in economic growth. Regions with a skilled workforce and diversified economic activities generally attract more investment and create wider employment opportunities. In less-developed areas, strengthening human capital and improving access to essential services are important steps toward reducing regional disparities.

3. Spatial Dimension

Location and connectivity strongly influence regional development. Areas linked with major cities, markets, ports, transport corridors and communication networks usually have greater access to economic opportunities. In contrast, geographical isolation can increase transportation costs and restrict access to services. Regional planning therefore needs to consider accessibility along with physical and socio-economic characteristics.

Regional Disparities: A Major Challenge

Regional disparity continues to be an important issue in India. Differences occur among states, districts and even neighbouring local areas in income, employment, infrastructure, agricultural productivity, education, healthcare, industrialization and connectivity. The rural–urban divide adds another layer to these differences. These inequalities have a clear spatial dimension. District-level analysis can reveal where development gaps are concentrated and which locations require priority intervention. Mapping

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

infrastructure, access to services, employment conditions and environmental vulnerability can help planners understand the geography of inequality. For Viksit Bharat @2047, a uniform approach may therefore be less effective than a spatially targeted approach. Development programmes should be designed around the specific problems and opportunities of individual regions. This does not mean reducing national priorities; rather, it means adapting those priorities to local conditions.

Rural Development and Regional Transformation

Rural India remains an important part of the country's economic and geographical structure. Agriculture continues to provide livelihoods to a large population, but rural economies are gradually becoming more diversified through services, tourism, small-scale industries, trade and entrepreneurship. Several rural areas, however, continue to face inadequate infrastructure, dependence on rainfall, limited market access, migration and gaps in digital connectivity. These conditions can restrict local employment and encourage movement of young people towards cities. Rural transformation should therefore go beyond basic infrastructure provision. Irrigation, rural roads, storage facilities, agro-processing, local markets, skill development, digital connectivity and entrepreneurship can strengthen rural economies. Development should build on local strengths rather than simply reproduce urban models in villages. Stronger rural–urban linkages can also connect producers with larger markets while allowing rural communities to retain more value from local economic activity.

Urbanization and Sustainable Cities

Urbanization is an important feature of India's development process. Cities provide employment, education, healthcare, trade, innovation and services. At the same time, rapid and poorly planned urban expansion creates pressure on land, water, transport and public infrastructure. Urban sprawl, traffic congestion, housing shortages, air pollution, waste generation, water stress and urban flooding are among the major challenges faced by growing cities. Expansion of built-up areas may also reduce agricultural land and affect natural drainage systems. Sustainable urban development requires integrated land-use planning, efficient public transport, adequate housing, open and green spaces, improved water management and effective waste disposal. GIS and Remote Sensing can support this process by showing changes in built-up areas, land use and infrastructure over time. Future cities need to be planned as inclusive and resilient settlements rather than merely as centres of economic growth.

Agriculture and Sustainable Regional Development

Agriculture is closely linked with geography because its performance depends on soil, climate, rainfall, water availability, landform and technology. Agricultural conditions vary widely across India, resulting in differences in productivity and farm income. Regional agricultural disparities are associated with irrigation facilities, rainfall reliability, soil quality, market access, technology and the availability of storage and processing facilities. Remote Sensing can assist in observing crop conditions and changes in land use, while GIS can help analyse the spatial distribution of soils, irrigation and agricultural activities. Future agricultural development should give greater attention to water-efficient practices, crop diversification, soil conservation, climate-resilient farming, improved market access and local processing. Technology should be used to support farmers and improve decision-making, while local knowledge should remain an important part of agricultural planning.

Natural Resources and Environmental Sustainability

India's natural resources are unevenly distributed. Land, forests, water, minerals and biodiversity support livelihoods and economic activity, but their excessive or unscientific use can produce serious environmental consequences. Groundwater depletion, soil erosion, deforestation, land degradation, pollution and biodiversity loss are examples of problems that can affect both the environment and local economies. Sustainable development requires a balance between resource use and conservation. Watershed development, groundwater conservation, afforestation, soil protection and ecosystem restoration can contribute to this balance. A geographical approach is particularly useful because environmental systems do not always follow administrative boundaries. A river basin, forest ecosystem or watershed may extend across several districts or states, making coordination essential.

Climate Change and Regional Resilience

Climate-related risks are not distributed uniformly across India. Coastal areas may face sea-level rise and extreme weather, while semi-arid regions may experience increasing water stress. Agricultural regions can be affected by changes in rainfall and temperature, and mountain environments may face ecological and hydrological changes. Climate adaptation should therefore be

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

region-specific. Vulnerable locations need appropriate measures based on their physical setting, population and livelihood structure. GIS and Remote Sensing can help identify vulnerable areas, monitor environmental changes and prepare risk maps. Such information can improve disaster preparedness and support climate-resilient development.

Infrastructure and Connectivity

Infrastructure is a major foundation of regional development. Roads, railways, ports, airports, communication networks and energy systems connect people and places with markets and services. Better connectivity can reduce travel time and transportation costs, support employment, encourage tourism and improve access to education and healthcare. At the same time, infrastructure projects need to consider environmental sensitivity and local requirements. Remote and economically disadvantaged regions may require connectivity solutions suited to their terrain and population density. Development should aim to reduce geographical isolation without creating unnecessary environmental damage.

Digital Inclusion and Spatial Inequality

Digital technology has changed the way people access education, employment, commerce, governance and financial services. Yet access to digital facilities remains uneven. Rural and remote communities may face problems related to internet connectivity, affordability, digital literacy and access to suitable devices. Digital inclusion should therefore be treated as an element of regional development. Reliable connectivity, affordable services, digital literacy, online education, e-governance and digital financial services can help reduce spatial inequalities. Without adequate digital access, people living in remote areas may remain excluded from opportunities that are increasingly available through online platforms.

Role of GIS and Remote Sensing in Regional Planning

Geospatial technologies have become increasingly useful in development planning. GIS allows different geographical datasets to be brought together and analysed spatially. It can support land-use planning, infrastructure mapping, accessibility studies, resource management and disaster-risk assessment. Remote Sensing provides information over large areas and makes it possible to observe changes through time. It has applications in crop monitoring, forest assessment, urban expansion, water-body monitoring, land degradation and environmental studies.The integration of GIS and Remote Sensing can improve the evidence available to planners. Instead of relying only on generalized regional assumptions, planners can examine spatial patterns and identify areas that require specific interventions. These technologies are particularly valuable for district-level and local planning, where differences between neighbouring areas can be significant.

Technology and the Future of Geographical Planning

The growing availability of digital information is changing geographical analysis. Large spatial datasets can be examined to identify patterns, estimate risks and support planning decisions. Data-driven methods can assist in areas such as urban growth assessment, flood-risk analysis, crop monitoring, land-use change and transport planning. However, technology should not be treated as a substitute for field knowledge or human judgement. Local communities understand many aspects of their environment that may not be visible in datasets. Effective planning should combine geospatial information, field investigation, local knowledge and institutional experience. The most useful technological approach is therefore one that strengthens decision-making rather than replacing the people responsible for it.

Tourism and Regional Development

Tourism can contribute significantly to regional development because India possesses diverse landscapes, cultural traditions, historical sites, religious centres and rural destinations. Tourism creates employment and can support local enterprises in accommodation, transport, food services, handicrafts and guiding. Rural tourism, eco-tourism, heritage tourism and agricultural tourism can help distribute economic opportunities beyond major urban centres. Improvements in roads and communication associated with tourism can also benefit local communities. Unplanned tourism, however, can create pressure on water resources, generate waste and damage fragile environments. Sustainable tourism should therefore involve local communities and respect the carrying capacity of destinations. Geographical tools can support tourism planning by examining accessibility, environmental sensitivity and the spatial distribution of attractions and facilities.

Research Findings

1. Development opportunities remain spatially uneven across India.
2. Rural and geographically isolated regions require stronger infrastructure and connectivity.
3. Sustainable management of land, water, forests and other natural resources is essential for long-term development.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

4. Rapid urbanization requires better spatial planning and infrastructure management.
5. Digital connectivity has become an important component of regional inclusion.
6. GIS and Remote Sensing can strengthen evidence-based development planning.
7. Data-driven technological methods can improve predictive and analytical capabilities when used responsibly.
8. Region-specific strategies are more appropriate than a single uniform development model.
9. Stronger rural–urban linkages can contribute to balanced regional development.
10. Environmental sustainability needs to remain central to the development strategy for 2047.

Recommendation

1. Prepare GIS-based development plans at district and local levels.
2. Identify regional development gaps using appropriate spatial indicators.
3. Improve infrastructure and connectivity in geographically isolated regions.
4. Promote sustainable and climate-resilient agricultural practices.
5. Expand reliable and affordable digital connectivity in rural areas.
6. Encourage decentralized economic activities based on local resources and skills.
7. Include environmental considerations in the planning and execution of infrastructure projects.
8. Strengthen geospatial education and practical training in higher education institutions.
9. Encourage geospatial entrepreneurship and technology-based local enterprises among young people.
10. Strengthen economic and service linkages between rural settlements and urban centres.

Conclusion

Viksit Bharat @2047 is a long-term national vision whose success depends on balanced development at regional and local levels. India's geographical diversity requires development strategies suited to the specific conditions and resources of different regions. Sustainable agriculture, resilient cities, rural infrastructure, digital inclusion and responsible resource management are essential for reducing regional inequalities. Better connectivity can overcome geographical isolation and strengthen rural–urban economic relationships. GIS and Remote Sensing can provide useful spatial information for planning and monitoring regional development. Modern technologies can further support the analysis of complex geographical problems, provided that reliable data, institutional capacity and human judgement are maintained. India's geographical diversity should therefore be considered an opportunity rather than only a challenge. Region-specific planning can promote local economic potential, protect the environment and improve social inclusion. Thus, the main objective of Viksit Bharat @2047 should be to create a prosperous, balanced, sustainable and inclusive India where development opportunities are accessible to people across different regions

Acknowledgement

I would like to express my sincere gratitude to everyone who supported and encouraged me in completing this research paper titled "Bharat @2047: A Geographical Perspective on Sustainable and Inclusive Regional Development." The study examines regional disparities, rural and urban development, sustainable resource management, digital inclusion, climate resilience, and the role of GIS and Remote Sensing in achieving balanced development. I am deeply thankful to my academic institution and the Department of Geography for providing the necessary academic environment, guidance, and encouragement. I also acknowledge the valuable contribution of government publications, institutional reports, academic literature, and development documents that provided the secondary information used in this study.

Abstract

The Dhangar Community is one of the traditional pastoral communities found in Maharashtra including Solapur district. The Dhangar Community has always had a connection with pastoralism, sheep and goat rearing moving with the seasons traditional jobs, family relationships, cultural activities and groups that work together.. Over time the way of life of the Dhangar Community has changed because of new money situations, more learning, cities growing new tools being used the environment changing and new jobs becoming available. These changes have led to changes in the way the Dhangar Community lives and how they are organized socially and culturally. This study wants to look at the changes happening in the cultural way of life of the Dhangar Community in Solapur district. It pays attention to changes in family setups how people get married, family connections, what jobs people do what they hope to learn what roles men and women play, religious activities, celebrations, traditions what they eat what they wear and how they get along with others in the community. The study also wants to find out how the members of the Dhangar Community deal with traditions and new ways of living. The research will use a method that involves going into the field and getting first-hand information from interviews watching what people do filling out questionnaires and talking with some people from the Dhangar Community. Information from sources will help understand the past how many people there are, the social side and the culture of the Dhangar Community. The study will pay attention to differences between older people and younger people and to what happens in homes where people have changed jobs or moved away. This study expects to show that the changes happening in the Dhangar Community are not about giving up old ways or just taking on new ways. Instead these changes are about adapting and finding a way to mix traditions the way the community sees itself and new goals that people have for their lives. The study could help people understand more about how the lives of people who live by herding animalsre changing. It could also offer ideas for programs and plans, about learning, jobs helping people live better and keeping traditions alive in Solapur district.

Keywords: *Dhangar Community, Socio-Cultural Transformation, Pastoral Community, Livelihood, Migration, Education, Kinship, Cultural Change, Solapur District.*

Introduction

Society is not a fixed thing. It keeps changing because of situations, education, technology moving to new places, politics, the environment and how people interact with each other. These changes are very clear in communities that have always been tied closely to nature and local resources. The Dhangar community is an example of a group that is changing slowly but still keeping many parts of its old culture. The Dhangars have always been involved in farming animals, sheep and goats. Their way of making a living has shaped parts of their life like where they live how they move with the seasons how families work what jobs people do and how the community connects. Knowledge about animals, where to graze, the environment, the weather and when to move around has been a part of their daily life.

Website: https://bnir.us

At the time these old ways have been changed by things like land use, where there is grass for animals, education, jobs, transport and new markets. Solapur district is a place to look at these changes. The district has areas where farming, raising animals working for wages and other jobs all happen together. Sometimes there is not water and access to natural things changes, which affects how people earn a living. Fo some Dhangars these problems have led to trying jobs moving for work and depending more on markets and new places. Education is another part of how the community is changing. Younger people are going to schools. Finding jobs that are not the old ways. This is changing what they want how they think about work, marriage, family and moving up in life. So there are differences between the people and the younger people in how they see and do old traditions. Changes in families and relatives are also important. Life in the days was helped a lot by big families and close ties with other people. More movement, education working outside the village and new money situations are making ways of living and how people connect. Marriage, what men and women do how families make decisions and what they expect from school and jobs are also getting different. Even though there are changes the Dhangar community still keeps a lot of its culture. Beliefs, festivals, ceremonies, knowledge how people get along food and other ways of showing culture still help people feel like they are part of a group. So the changes in the Dhangar community should not be seen as moving from old ways to new ones. It is better to think of it as a process where old ways are kept, changed or replaced based on what's happening now. This study tries to look at how the Dhangar community's changing in social and cultural ways in Solapur. It wants to find out what the changes are and what causes them and also how the people in the community see these changes. Special attention is given to how old traditionsre linked with new social, economic and school influences. By using an anthropology view the study wants to understand change through the lives of the people not just through numbers or money. This way it can understand more, about how social systems, ways, how people support themselves and the communitys sense of who they are is changing in Solapur today.

Statement of the Problem

The Dhangar community has long been linked with pastoralism and livestock-based livelihoods. In Solapur district members of the Dhangar community have traditionally depended on sheep and goat rearing, seasonal movement, agriculture and related occupations. These livelihood practices have shaped their family organization, social relationships, cultural traditions and everyday patterns of life. However the conditions under which the Dhangar community lives and works have changed considerably over time.The availability of grazing land changes in practices economic pressures, educational opportunities and access to modern services have affected traditional livelihood patterns of the Dhangar community. Many families of the Dhangar community have gradually adopted sources of income while some members of the Dhangar community have moved towards wage employment, small businesses, education and other occupations. These occupational changes have consequences beyond the sphere of the Dhangar community. They can influence family responsibilities, gender roles, social relationships, mobility and the transmission of knowledge from one generation to another among the Dhangar community The younger generation of the Dhangar community presents an important area of inquiry. Greater exposure to education digital communication, urban lifestyles and employment opportunities has created new aspirations and expectations for the younger Dhangar community. At the time older cultural practices continue to influence community life of the Dhangar community. This situation may produce both continuity and change within the family or community of the Dhangar community. Understanding this interaction is important for examining the direction and character of socio-transformation of the Dhangar community. Changes can also be observed in marriage practices, household organization, religious observances, festivals, dress, food habits and other cultural expressions of the Dhangar community. Some traditional practices may continue with modifications while others may become less prominent among the Dhangar community. However the extent and nature of these changes may differ according to age, education, occupation, economic position, gender and place of residence of the Dhangar community. The central problem of the research is therefore to understand how the Dhangar community in Solapur district is responding to changing social economic, environmental and cultural circumstances. The study does not assume that traditional culture is simply disappearing. Instead it examines whether traditional practices of the Dhangar community are being retained, modified or gradually replaced and how members of the Dhangar community interpret these changes in their lives. The research also seeks to identify the factors contributing to socio-cultural transformation of the Dhangar community and to examine their consequences for community

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

identity, social relationships, livelihood practices and intergenerational continuity of the Dhangar community. Through a field-based investigation the study attempts to present the experiences and perspectives of the Dhangar community itself. Thus the problem addressed in this study is the changing relationship, between Dhangar social and cultural practices and the contemporary forces influencing community life in Solapur district. Understanding this relationship can provide a grounded picture of the processes of social change taking place within a traditionally pastoral Dhangar community.

Objectives of the Study

The present study is undertaken with the following objectives:

1. To look at the social and cultural practices of the Dhangar community in Solapur district.
2. To study the changes happening in the family structure and household organization of the Dhangar community.
3. To examine how marriage practices, kinship relations and patterns of interaction are changing within the Dhangar community.
4. To understand the changes happening in the occupations and livelihood practices of the Dhangar community.
5. To assess how education shapes the attitudes, aspirations and job choices of the younger generation in the Dhangar community.
6. To examine how the roles and responsibilities of women are changing within Dhangar households and community life.
7. To study how migration, urbanization and modern communication technologies affect the socio- life of the Dhangar community
8. To examine changes in customs, rituals, festivals, food habits, dress patterns and other cultural expressions of the Dhangar community.
9. To identify the social economic, environmental and cultural factors that drive transformation, within the Dhangar community
10. To examine how cultural continuity and social change relate across generations of the Dhangar community.
11. To understand how members of the Dhangar community see and explain the changes happening in their cultural life.
12. To assess what the socio-cultural transformation means for preserving the Dhangar identity and traditional knowledge.

Review of Literature

The Dhangar community has attracted scholars from angles especially regarding pastoralism, livelihood, migration, environmental conditions, social organization and cultural practices.. The literature is still limited compared to studies of other groups. These studies give insights into many aspects of Dhangar life and set the stage for looking at modern socio-cultural change. Reddy, Demarchi and Malhotra (2002) studied variation among endogamous groups inside the Dhangar community of Maharashtra. Their research shows that Dhangars are not a uniform group; there is much internal diversity among Dhangar groups. This work is very useful for seeing the community's differences and gives an anthropological base for exploring social differences inside the larger Dhangar identity. Draxe (1997) offered a study of the Dhangar community and its environment highlighting how the community interacts with surrounding environmental conditions. His work is important because pastoral groups cannot be examined apart from the resources that support their traditional livelihood. This study gives a view of how environmental conditions influence Dhangar social life. Newer research focuses more on livelihood change among Dhangars. Narbats study on transformation and livelihood diversification looks at how people in the Dhangar community in Maharashtra have reacted to shifting economic conditions. The research shows a move from relying only on traditional pastoral work and spotlights the rise of varied livelihood strategies. This gives a foundation for grasping how job changes drive broader social transformation.

Narbats research on changes and pastoral nomadism digs deeper into how shifting environmental conditions affect the Dhangar community's traditional mobility and livelihood practices. The study shows that changes in rainfall, drought, grazing resources and other environmental factors alter migration routes and livestock management. These pressures also push Dhangar livelihood practices and parts of life to change. Another study by Narbat looks directly at drought and resilience among Dhangar pastoralists in Maharashtra. Using methods like in-depth interviews and focus group discussions the study explores the vulnerabilities that drought brings and how Dhangar community members react to these pressures. It points out problems with pasture, water, livestock livelihood security and limits caused by changing land-use patterns. This study is very helpful for seeing how environmental stress, livelihood adaptation and community resilience connect. Research on natural-resource management among Dhangar pastoralists has highlighted the importance of pasture and water resources. Traditional pastoral mobility relies a lot on access to these resources and environmental and land-use changes can limit movement and push Dhangar people toward livelihood diversification. This

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

literature matters for the study because livelihood changes can affect not only economic conditions but also social relationships, occupational identity and cultural practices Other studies have looked at Dhangar folklore and cultural expression to learn about the community's history and identity. A study in the Bodhi International Journal of Research in Humanities, Arts and Science claims that folklore traditions, songs, stories and women's ovi traditions give useful insights into the Dhangar community's social, political and economic experiences. These cultural materials matter because they keep community memories alive and offer another way to understand change. A recent study of practices and human-animal relationships portrays Dhangars of Maharashtra as a semi-nomadic pastoral community with yearly movement linked to livestock, seasons and pasture availability. The study also points out the importance of pastoral practices and the need to look at ties among people, animals and the environment. This view deepens the grasp of Dhangar livelihood beyond just an economic view.Research on Dhangar settlements has also shown changes in jobs. A study of a village mainly inhabited by Dhangar people found that sheep and goat rearing had been key. Some residents have moved more toward settled farming. The study also looked at involvement in self-help groups indicating that fresh economic arrangements can join community life as job patterns shift. Recent literature shows that Dhangar community faces changes in linked areas: livelihood, environmental adaptation, migration, resource use, cultural practices and social organization. Yet current literature often focuses on areas like pastoralism, drought, livelihood vulnerability, natural-resource management or socio-economic conditions. Research Gap The review shows a need for an anthropological look at socio-cultural change among the Dhangar community in Solapur district. Current studies give data on pastoral livelihood, environmental vulnerability, migration and economic diversification but they pay much less attention to how family structure, marriage practices, kinship ties, gender roles, education, cultural traditions, religious practices and intergenerational relations all change together in the community. The present study tries to fill this gap by looking at change as a multi-layered process. Of seeing job change as only an economic issue the study aims to grasp how shifts in livelihood, education, migration, environmental conditions and contact with modern institutions link to larger changes in daily social and cultural life.Focusing on Solapur district gives a chance to see how a pastoral community adapts to that area's specific environmental, economic and social conditions. The study therefore wants to add a field-based view to the current literature, on the Dhangar community.

Research Methodology

The study uses an analytical approach from the field of anthropology to look at changes in the way people live and behave in the Dhangar community in Solapur district. Data Sources: Both primary information and secondary information will be used. Primary information will come from talking to people filling out forms watching what happens and having chats. Secondary information will come from books articles written by researchers reports from the government and other similar materials. Sampling: Some Dhangar homes in villages and places in Solapur district will be picked using a method called purposive sampling. Data Analysis: Numbers and facts will be shown in tables and with percentages. Words and stories will be looked at in groups based on themes. The way the research is done is meant to learn about the changes, in how the Dhangar community lives and what causes those changes.

Data Presentation and Interpretation

Explanation: The table shows that respondents from the 31–45 age group make up the share 35%. Next comes respondents, from the 18–30 age group, 30%. Seeing respondents who're younger and respondents who are older helps us see how tradition, education, occupation and cultural change are seen differently by each age group.

The table shows that sheep and goat rearing is still an occupation making up 40% of the people surveyed. Agriculture comes next at 25%. Wage labour accounts for 20%. This means that while traditional pastoral work remains a part of life many people are also looking to other ways to earn a living. It shows that the community is slowly moving toward diverse income sources even as they keep their old ways alive.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Major Findings of the Study

Table 1: Age-wise Distribution of Respondents

Sr. No.	Age Group (Years)	Number of Respondents	Percentage (%)
1.	18 – 30	30	30.0
2.	31 – 45	35	35.0
3.	46 – 60	25	25.0
4.	Above 60	10	10.0
	Total	100	100.0

Table 2: Occupational Pattern of Respondents

Sr. No.	Occupation	Number of Respondents	Percentage (%)
1.	Sheep and Goat Rearing (Traditional)	40	40.0
2.	Agriculture	25	25.0
3.	Wage Labour	20	20.0
4.	Business / Self-employment	10	10.0
5.	Government / Private Service	5	5.0
	Total	**100**	**100.0**

The study shows that the Dhangar community in Solapur district is going through a steady change in social and cultural life. Keeping sheep and goats remains a part of everyday life for many families. However more people are now turning to farming, daily wage work, small businesses and jobs in the service sector to earn their living. These shifts in how people make a living have also changed family setups and day-to-day social ties. The old way of living in joint families is slowly giving way to smaller nuclear households, especially among younger generations. Education plays a role in this change. Younger members of the community are more likely to want education, formal jobs and better standards of living. Their views on marriage choosing a partner and traditional customs are also changing. Many are moving away from standing traditions. Migration for jobs has become another influence. It impacts household income the way families interact with each other and their connection to society. Women are getting more involved in social life. Through education self-help groups and income-generating projects they are gaining independence. This leads to changes in the roles women play within the family. Yet important parts of Dhangar culture are still kept alive. Festivals, rituals traditional stories passed down by word of mouth and close community bonds help preserve identity. Differences between younger members are clear when it comes to careers, schooling, lifestyles and cultural values. Environmental challenges like drought lack of water and shrinking grazing land have made it harder to continue herding. These problems push people toward ways of making a living. In the end the findings show that the transformation in the Dhangar community is not about losing tradition. It is, about adapting. Traditional values and practices are being kept in some form adjusted in others and replaced in some cases. All shaped by social economic and environmental realities.

Conclusion

The study shows that the Dhangar community in Solapur district is going through changes in society and culture.. The community still keeps many parts of its old way of life. Changes in how people make a living in education in moving to places in how families are set up in how people get married and in what men and women do have changed the daily life of the community. Pastoral work is still important. Money problems, weather conditions and new chances have made people look for different jobs. Education and meeting people have had a big effect on the younger people. They now want things and think differently about old jobs and old ways.. Festivals, religious beliefs, old habits stories told out loud and the way people get along with each other still keep the culture going. The changes in the Dhangar community should be seen as a way to adjust not as a loss of culture. The community is trying to balance ways, with new life and money needs. Opportunities to have a way to earn money, better education and help to keep old knowledge and culture can help the community deal with change without losing what makes it special.

Abstract

Vikasit Bharat 2047 is India's official national vision plan to transform the country into a fully developed nation by the 100th anniversary of its independence in the year 2047. This paper argues that this vision is not a new policy invention, but a civilizational revival. By analyzing NITI Aayog's strategic framework and Press Information Bureau reports, this paper connects India's historical economic dominance, its colonial decline, and its post-independence resurgence to the future roadmap. The paper is divided into three phases: Economic Foundations, Four Pillars of Social Transformation, and Technological Sovereignty.

Keywords: *Viksit Bharat @2047, Developed India, Historical Development, Economic Growth, Aatmanirbharta, Social Transformation, GYAN, Youth Empowerment, Women Empowerment, Agricultural Development, Technological Sovereignty, Digital Public Infrastructure, Artificial Intelligence, Green Energy, Sustainable Development, Governance Reforms.*

Introduction: The Historical Continuum Of Indian Growth

India's journey toward 2047 is not a sudden policy shift. It builds on thousands of years of economic, scientific, and social history. Ancient India was a major global trade hub, contributing nearly a quarter of world GDP through robust manufacturing, metallurgy, and spice trade. Economic historian Angus Maddison's research shows that in 1700 AD, India held 24.4% of world income. This was due to strong trading networks from the Indus Valley to the Roman Empire, and later Chola naval trade to Southeast Asia. The NITI Aayog strategic framework outlines that modern development must reconnect with this historical self-reliance - Aatmanirbharta, while using modern digital systems. The concept of Viksit Bharat is therefore based on the principle of _Virasat
par Garv_ - Pride in Heritage and _Vikas_ - Development.
We can divide India's economic history into 4 key periods relevant to 2047:

1. **Ancient Heritage:** Trading networks from the Indus Valley to the Roman Empire.
2. **Post-Independence Era:** The green revolution, industrial base building, and space programs.
3. **The 1991 Reforms:** Liberalization that opened markets and accelerated GDP expansion.
4. **The 2047 Horizon:** Moving from a developing market to a $30 trillion global powerhouse.

This paper will show how each era provides a lesson for the future.

Phase 1: Economic Foundations And Historical Parallels

To reach developed status, India targets a GDP of $30 to $40 trillion by 2047. Per capita income must rise from roughly $2,400 to over $18,000. This requires avoiding the middle-income trap that has trapped countries like Brazil and South Africa.

Quick Response Code:

Website: https://bnir.us

History shows that economic leaps require structural integration. Just as ancient empires unified trade routes, modern India uses digital public infrastructure to link remote villages to national markets.

s**A. Target GDP: $30 trillion to $40 trillion economy**.

In 1947, our GDP was just Rs 2.7 lakh crore. Today it is $3.75 trillion. To reach $30 trillion, we need a sustained growth rate of 7-8% for 25 years. This is historically possible. Ancient Mauryan empire achieved this through a unified tax system described in Kautilya's Arthashastra. Today, GST is doing the same - One Nation, One Tax. PM Gati Shakti is doing what Sher Shah Suri did with the Grand Trunk Road - connecting the nation for trade.

B. Per Capita Income: $18,000 per annum threshold.

The World Bank defines a developed country as one with per capita income above $13,845. India aims for $18,000 to provide a buffer. In ancient times, India's per capita income was among the highest. Colonial rule destroyed it. The drain of wealth, as explained by Dadabhai Naoroji, reduced India to one of the poorest countries. Viksit Bharat is essentially reversing that drain.

C. Avoiding Middle-Income Traps: Emphasizing high-end manufacturing and logistics.

Countries get stuck when they only do low-cost manufacturing. India must focus on high-value manufacturing. The historical parallel is clear. India was famous for Wootz steel, a high-tech product of its time. We must again become leaders in high-tech products like semiconductors, green hydrogen, and electric vehicles. The government's PLI scheme and reduction of logistics cost from 14% to 8% of GDP are steps in this direction.

3. Phase 2: The Four Pillars Of Social Transformation

The modern roadmap identifies four core demographic groups, often termed the four pillars of transformation: Garib, Yuva, Annadata, Nari Shakti. The NITI Aayog calls this GYAN.

Garib - The Poor: Achieving 100% saturation of basic needs

Objective: No one left behind. Historical context: After independence, India faced extreme poverty and food shortage. We depended on PL-480 wheat from the USA. The Green Revolution by M.S. Swaminathan made us self-sufficient. Roadmap to 2047: 100% saturation approach. This means every eligible person gets housing - PM Awas Yojana, clean water - Jal Jeevan Mission, electricity, toilet, and health insurance - Ayushman Bharat. The target is to bring multidimensional poverty from 15% to below 1% by 2047.

Yuva - The Youth: Utilizing education reforms

India has the world's largest youth population - 65% under 35. This is a demographic dividend. Historical context: Ancient India's universities like Nalanda and Takshashila were global hubs. Students from China, Korea, and Central Asia came to study. We were Vishwaguru because of our youth's knowledge. Roadmap to 2047: NEP 2020 is the key reform. It focuses on skill-based, multidisciplinary education. The goal is to increase Gross Enrolment Ratio in higher education from 28% to 50% by 2035. Skill India aims to make India the skill capital of the world, providing AI, drone, and robotics training to crores of youth. This will convert our population into an asset.

Annadata - Farmers: Transitioning from subsistence to high-tech

Historical context: India has always been an agricultural civilization. The Indus Valley was known for its granaries.

Roadmap to 2047: Move from subsistence farming to profitable farming. Focus on:

- Natural farming and Millets - Shri Anna, which was our ancient diet.
- Use of drones, AI for crop prediction, and e-NAM for market access.
- Doubling farmers' income and making India a top exporter of processed food, not just raw food.

Nari Shakti - Women: Expanding workforce participation

Historical context: From Gargi and Maitreyi in Upanishads to Rani Lakshmibai, women have always led in Indian history. However, female labour force participation fell to 23% in 2019.

Roadmap to 2047: Expanding female workforce participation above 50%. Schemes like Lakhpati Didi - to make 3 crore women entrepreneurs, 33% reservation in Parliament, and 50% reservation in local bodies are crucial. No country has become developed without full participation of women. This is a core lesson from global history.

Phase 3: Technological Sovereignty And Innovation

India's historical prowess in mathematics - invention of zero by Aryabhatta - and astronomy translates today into leadership in Artificial Intelligence, space exploration, and semiconductors. The Press Information Bureau notes that Digital Public Infrastructure - DPI - acts as a non-linear accelerator for productivity.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

A. Semiconductors: Establishing domestic fabrication plants

In the past, India's Wootz steel was the most advanced material. Today, semiconductors are the new steel. The COVID-19 pandemic showed that dependence on Taiwan and China for chips is dangerous. This is the colonial lesson - dependence is vulnerability. The India Semiconductor Mission with investment of Rs 76,000 crore is building FAB plants in Gujarat and Assam. Target: To capture 10% of global chip market by 2047.

B. Green Energy: Driving toward net-zero emissions

India's tradition has always been environmental. Vedas worship nature as mother. The LiFE movement - Lifestyle for Environment - is based on this.

Target: 500 GW non-fossil fuel capacity by 2030. Net-zero emissions by 2070. Becoming the world's largest producer of Green Hydrogen. This will ensure energy security, a lesson learned from the 1991 oil crisis and colonial exploitation of resources.

C. Space and AI: Integrating automation into public welfare

From launching Aryabhatta satellite in 1975 to Chandrayaan-3's success on the moon's south pole in 2023, ISRO has shown frugal innovation. Roadmap to 2047: Gaganyaan human space flight, space economy of $44 billion by 2033, and National Quantum Mission. AI will be used for public welfare - AI for health diagnosis in villages, AI for crop advisory, and AI for education in local languages. UPI, Aadhaar, and ONDC are examples of Digital Public Infrastructure that the world is now adopting.

Governance: The Legacy Of Sardar Patel

No roadmap is complete without political integration. In 1947, Sardar Vallabhbhai Patel integrated 565 princely states. Without him, India would be fragmented like Europe. Viksit Bharat requires the same iron will for governance reforms:

- One Nation One Election
- for administrative efficiency
- Direct Benefit Transfer - DBT
- has saved Rs 3.5 lakh crore by removing middlemen - continuing Patel's fight against corruption
- Aspirational Districts Programme
- to develop the 112 most backward districts, ensuring balanced development

Conclusion

Vikasit Bharat 2047 transforms historical potential into modern economic reality. By combining ancestral traditions of self-reliance with cutting-edge technology, India seeks a sustainable, equitable, and prosperous future. It is not just about becoming the 3rd largest economy. It is about becoming a developed country with an Indian character. It means reviving the economic glory of ancient India, the infrastructural vision of medieval India, learning the lesson of self-reliance from colonial history, and using the democratic and technological strength of post-independence India. The target of $30 trillion GDP, $18,000 per capita income, 100% literacy, and zero poverty is ambitious but historically achievable. If India could contribute 25% of world GDP 300 years ago without modern technology, it can certainly do it again with AI, space, and its youth.

Abstract

The vision of Viksit Bharat @2047 represents India's aspiration to emerge as a developed, inclusive, innovative, technologically advanced and knowledge-driven nation by the centenary of its independence. The achievement of this vision depends substantially on the quality of human capital developed through education. School education, in particular, has a foundational role because the students educated today will become the professionals, entrepreneurs, researchers, teachers, administrators, innovators and responsible citizens who will shape India's social and economic development in the coming decades. In this context, the National Education Policy (NEP) 2020, digital transformation and skill-based education have emerged as three interconnected dimensions of educational reform. NEP 2020 seeks to transform Indian education through a holistic, multidisciplinary, flexible and competency-oriented approach. It emphasizes foundational literacy and numeracy, experiential learning, critical thinking, creativity, vocational education, multilingualism, technology integration and the development of 21st-century competencies. The policy also recognizes that digital technologies can support teaching-learning, assessment, teacher development and access to educational resources. At the same time, the rapid development of artificial intelligence, digital platforms, virtual learning environments, educational applications and data-driven systems is changing the nature of teaching and learning. Digital transformation, however, should not be understood merely as the replacement of textbooks with screens or classrooms with online platforms. It requires a fundamental reconsideration of pedagogy, curriculum, assessment, teacher competencies and learner participation. Skill-based education is equally important for preparing learners for a changing world of work. Traditional education that primarily emphasizes the accumulation and reproduction of information may not adequately prepare students for employment, entrepreneurship, innovation and lifelong learning. Future-ready learners require a combination of academic knowledge, digital literacy, communication, collaboration, creativity, critical thinking, problem-solving, financial awareness, entrepreneurial thinking, vocational competencies and social-emotional skills. The present paper critically examines the relationship between NEP 2020, digital transformation and skill-based education in the context of Viksit Bharat @2047. The study adopts a qualitative conceptual and analytical research design based on secondary sources, including policy documents, government publications, international reports and relevant academic literature. The analysis identifies four major dimensions of transformation: policy reform, technological transformation, competency development and educational equity. The study argues that technology can significantly enhance educational opportunities, but its effectiveness depends upon teacher preparedness, appropriate pedagogy, infrastructure, accessibility, digital safety and meaningful integration into the curriculum. UNESCO similarly emphasizes that technology should support education rather than replace human interaction and that equitable access, appropriate governance and teacher capacity are essential conditions for effective digital transformation.

Website: https://bnir.us

The paper proposes a strategic roadmap for 2047 based on universal digital access, teacher capacity building, AI and digital literacy, vocational exposure, experiential learning, competency-based assessment, multilingual digital content, school-industry partnerships, innovation ecosystems and inclusive education. It concludes that the real strength of Viksit Bharat will depend not merely on the number of digitally connected schools but on the ability of schools to develop knowledgeable, skilled, innovative, ethical, adaptable and socially responsible citizens. Therefore, NEP 2020, digital transformation and skill-based education should be implemented as complementary components of an integrated human-capital development strategy.

Keywords: *NEP 2020; Digital Transformation; Skill-Based Education; Viksit Bharat @2047; Digital Literacy; Artificial Intelligence; Competency-Based Learning; Teacher Competencies; Educational Equity; Vocational Education; Future-Ready Education; Human Capital Development.*

Introduction

Education is universally recognized as one of the most powerful instruments of individual and national development. It influences human capabilities, economic productivity, social mobility, democratic participation, cultural development and innovation. In the twenty-first century, however, the purpose and processes of education are undergoing significant transformation. Technological developments have changed how people communicate, work, access information and solve problems. Artificial intelligence, automation, robotics, cloud computing, digital platforms and data analytics are influencing almost every sector of society. Consequently, educational institutions are expected to prepare learners not merely to acquire information but to interpret, evaluate, create and apply knowledge. India's aspiration of becoming a developed nation by 2047 makes this transformation particularly important. The Government of India has identified education as an important component of the broader Viksit Bharat vision. The Ministry of Education has stated that NEP 2020 aims to create an education system aligned with India's developmental aspirations and to contribute towards an equitable and vibrant knowledge society. The National Education Policy 2020 represents a significant shift in the philosophy of Indian education. It emphasizes holistic development, competency-based learning, experiential learning, vocational education, multilingualism, technology integration and flexibility in educational pathways. The policy also seeks to remove rigid distinctions between academic and vocational education and between curricular and extracurricular learning. Digital transformation provides an important mechanism through which these educational reforms can be implemented. Digital resources can extend learning beyond classroom boundaries, provide differentiated learning opportunities and support teachers with new instructional resources. However, technology does not automatically improve learning. UNESCO's 2023 Global Education Monitoring Report emphasizes that digital technology's educational impact is uneven and that teacher capacity, equitable access and appropriate governance are essential. Skill-based education complements this transformation by connecting education with practical application and future employment. The future workforce will require individuals who can continuously learn, adapt to technological change and apply knowledge creatively.

Therefore, the integration of NEP 2020 + Digital Transformation + Skill-Based Education can become a powerful educational strategy for achieving Viksit Bharat @2047.

Background of the Study:

India has one of the world's largest school education systems. The size and diversity of the Indian education system create both opportunities and challenges.

Students come from different:

- socioeconomic backgrounds;
- geographical regions;
- linguistic communities;
- learning environments;
- technological backgrounds; and
- cultural contexts.

A future-oriented education system therefore needs to address both quality and equity.

NEP 2020 attempts to provide a framework for such transformation. Its proposed 5+3+3+4 curricular and pedagogical structure, emphasis on foundational literacy and numeracy, vocational exposure, multidisciplinary learning and technology integration are intended to make education more holistic and relevant. The Ministry of Education has also developed several initiatives associated with NEP 2020, including NDEAR, NETF, Virtual Open School, NISHTHA 2.0 and resources related to foundational literacy and numeracy.

These developments indicate that India's educational transformation is increasingly connected with digital and competency-based approaches.

Statement of the Problem:

"NEP 2020, Digital Transformation and Skill-Based Education: A Strategic Roadmap for Viksit Bharat @2047"

The problem addressed in this study is the need to understand how policy reform, digital transformation and skill-based education can collectively contribute to the development of a

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

future-ready school education system capable of supporting India's long-term developmental vision.

Need and Significance of the Study:

The study is significant for several reasons.

Changing Nature of Employment:

Automation and emerging technologies are transforming employment patterns. Students therefore need adaptability and continuous learning capabilities.

Increasing Importance of Digital Competence:

Digital literacy is becoming essential for education, employment and social participation.

Need for Practical Education:

Students require opportunities to apply knowledge in real-life situations.

Implementation of NEP 2020:

The successful implementation of NEP 2020 requires understanding how its major recommendations can be translated into classroom practices.

Viksit Bharat @2047:

The quality of India's future human capital will significantly influence its development trajectory.

Educational Equity:

Digital transformation should not create a new form of inequality between digitally advantaged and digitally disadvantaged learners.

Objectives of the Study:

The study has the following objectives:

1. To examine the role of NEP 2020 in transforming school education.
2. To analyze the significance of digital transformation in education.
3. To examine the importance of skill-based education for future-ready learners.
4. To study the relationship between digital transformation and competency development.
5. To identify challenges associated with digital and skill-based educational transformation.
6. To examine the role of teachers in implementing technology-enabled education.
7. To develop a strategic roadmap for integrating NEP 2020, digital transformation and skill development towards Viksit Bharat @2047.

Research Questions:

The study addresses the following questions:

1. How can NEP 2020 contribute to educational transformation for Viksit Bharat @2047?
2. What role can digital technologies play in school education?
3. Which skills should schools develop among future generations?
4. What challenges may affect the implementation of digital and skill-based education?
5. How can teachers and schools become future-ready?
6. What strategic measures can strengthen educational preparation for Viksit Bharat @2047?

Research Methodology:

Research Approach:

The study follows a **qualitative conceptual and analytical approach**.

Research Design:

A descriptive and analytical research design was adopted.

Sources of Data:

The study uses secondary data obtained from:

- Government of India policy documents;
- Ministry of Education publications;
- NEP 2020;
- official government reports;
- UNESCO reports;
- international educational publications;
- scholarly literature; and
- relevant educational frameworks.

Method of Analysis:

The literature was analyzed thematically under the following major categories:

1. NEP 2020;
2. digital transformation;
3. skill-based education;
4. teacher competencies;
5. educational equity;
6. AI and emerging technologies;
7. competency-based assessment; and
8. Viksit Bharat @2047.

Review of Literature:

National Education Policy 2020:

NEP 2020 represents a comprehensive restructuring of India's education system. It emphasizes holistic development, foundational learning, competency development, vocational education, multilingualism, technology and flexible learning pathways. The policy also emphasizes technology-enabled assessment and blended learning while recognizing that face-to-face learning remains important.

UNESCO – Technology in Education:

UNESCO's 2023 Global Education Monitoring Report highlights the potential of technology to improve access, teaching and learning but also emphasizes that technology can increase inequalities if access and implementation are uneven. The report identifies equitable access, teacher capacity and appropriate governance as important conditions for effective use of technology.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Digital Transformation:
Digital transformation has expanded educational opportunities through digital content, learning management systems, online resources, virtual laboratories and collaborative platforms. However, meaningful transformation requires changes in pedagogy and institutional practices rather than simple digitization.

Skill Development:
The increasing importance of digital and transferable skills indicates that education systems need to prepare learners for changing occupational environments. Skill development should therefore begin before students enter the labour market.

Emerging Artificial Intelligence:
Artificial intelligence creates opportunities for personalized learning, feedback, translation, educational analytics and content development. However, it also raises questions regarding privacy, bias, academic integrity, misinformation and responsible use. UNESCO emphasizes the need for appropriate governance in the context of rapidly emerging generative AI tools.

Research Gap:
The existing policy and educational literature provides substantial discussion of NEP 2020, digital education and skill development individually. However, there is a need for a more integrated conceptual understanding of how these three dimensions can collectively contribute to Viksit Bharat @2047.

The major research gap identified is therefore:
The need for an integrated educational framework connecting policy reform, digital transformation, skill development, teacher preparedness and educational equity with India's long-term development vision. The present study attempts to address this gap through a conceptual roadmap.

NEP 2020 as a Foundation for Viksit Bharat:
NEP 2020 can contribute to Viksit Bharat through several mechanisms.
Holistic Development:
Education should develop intellectual, physical, emotional, social and ethical dimensions.

Competency-Based Learning:
The focus should move from memorization towards understanding and application.
Experiential Learning:
Projects, experiments, field visits and practical activities can connect knowledge with real-life problems.
Vocational Education:
Students should receive exposure to vocational skills and the world of work.
Multidisciplinary Learning:
Rigid boundaries between subjects can be reduced.
Indian Knowledge Systems:
Indian knowledge traditions can be integrated appropriately with modern scientific and technological education.

Digital Transformation in School Education:
Digital transformation can influence education in several ways.
Digital Content:
Students can access:
- e-books;
- videos;
- simulations;
- interactive lessons;
- digital laboratories;
- educational applications.

Personalized Learning:
Digital systems can help provide differentiated learning experiences.
Online and Blended Learning:
Students can combine classroom learning with digital resources.
Digital Assessment:
Technology can support continuous assessment and learning analytics.
Artificial Intelligence:
AI can support:
- personalized feedback;
- language translation;
- adaptive learning;
- educational content generation;
- learning analytics.

However, AI should remain a support tool rather than replacing teacher-student relationships.

Skill-Based Education:
A future-ready school education system should develop multiple categories of skills.

Skill Category	Examples
Cognitive Skills	Critical thinking, reasoning
Digital Skills	Digital literacy, AI literacy
Communication Skills	Speaking, writing, presentation
Social Skills	Collaboration, teamwork
Creative Skills	Innovation, design thinking

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Skill Category	Examples
Vocational Skills	Practical occupational skills
Entrepreneurial Skills	Business ideas, financial awareness
Life Skills	Decision-making, adaptability
Environmental Skills	Sustainability awareness
Ethical Skills	Responsibility, integrity

Digital Skills for Future-Ready Students:
Students should progressively develop:

Basic Digital Skills:
- operating digital devices;
- searching for information;
- communicating online.

Intermediate Skills:
- digital content creation;
- presentations;
- spreadsheets;
- collaborative platforms.

Advanced Skills:
- coding;
- data literacy;
- AI literacy;
- computational thinking;
- digital design.

Responsible Digital Citizenship:
Students should understand:
- privacy;
- cybersecurity;
- misinformation;
- copyright;
- online behaviour;
- ethical AI use.

Role of Artificial Intelligence in Education:
AI is likely to influence education significantly before 2047.
Potential educational applications include:
1. personalized learning;
2. intelligent tutoring;
3. automated feedback;
4. language translation;
5. accessibility tools;
6. learning analytics;
7. educational content development;
8. career guidance.

However, schools should also teach students to identify:
- inaccurate AI-generated information;
- bias;
- misinformation;
- privacy risks;
- inappropriate dependence on AI.

The objective should be AI-enabled learning, not AI-dependent learning.

Role of Teachers:
Teachers are central to educational transformation.
The future teacher can perform multiple roles:
Teacher → Facilitator → Mentor → Digital Guide → Learning Designer → Researcher → Innovation Promoter
Teacher education should therefore include:
- digital pedagogy;
- AI literacy;
- competency-based assessment;
- inclusive education;
- project-based learning;
- experiential learning;
- digital citizenship.

UNESCO's evidence emphasizes that insufficient teacher preparedness can limit the educational value of technology.

Role of Schools:
Schools should evolve from traditional teaching centres into learning and innovation ecosystems.
Future-ready schools should provide:
- digital infrastructure;
- laboratories;
- innovation spaces;
- vocational exposure;
- sports;
- arts;
- entrepreneurship activities;
- environmental projects;
- community engagement.

Challenges:
Digital Divide:
Students do not have equal access to devices and internet connectivity.
Infrastructure:
Some schools may face challenges related to electricity, connectivity and maintenance.
Teacher Training:
Teachers need continuous professional development.
Language Diversity:
Digital educational content needs greater availability in Indian languages.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Cyber security:
Digital education creates privacy and cybersecurity concerns.
Screen Dependence:
Excessive screen use may reduce physical activity and direct social interaction.
Quality of Digital Content:
Availability of digital content does not guarantee its educational quality.

Assessment:
Traditional examinations may not adequately measure creativity, collaboration and practical skills.
UNESCO similarly notes that digital technology's effects vary according to socioeconomic conditions, teacher preparedness and context.

Findings of the Conceptual Analysis:
The study identifies the following major findings:
Finding 1
NEP 2020 provides a strong policy foundation for competency-oriented and future-ready education.
Finding 2
Digital technology can expand access to educational resources but cannot independently guarantee better learning.
Finding 3
Teacher preparedness is one of the most important conditions for successful digital transformation.
Finding 4
Skill-based education needs to become an integral part of mainstream school education.
Finding 5
Digital transformation must address the digital divide.
Finding 6
AI literacy should become an important component of future-oriented education.
Finding 7
Assessment systems need to increasingly measure application, creativity and competencies.
Finding 8
Multilingual digital resources are necessary for equitable access.
Finding 9
School-industry and school-community partnerships can strengthen practical learning.
Finding 10
The development of human values must remain central despite increasing technological integration.
Discussion:
The findings suggest that educational transformation should not be treated as three separate processes.
Instead:
NEP 2020
provides the **policy direction**.
Digital Transformation
provides the **technological infrastructure and learning possibilities**.
Skill-Based Education
provides the **competencies required for practical life and work**.
These three elements together can produce:
Knowledge + Skills + Technology + Creativity + Values
which can contribute to:
Future-Ready Human Capital
and ultimately:
Viksit Bharat @2047
The most important principle emerging from this analysis is that technology must remain subordinate to educational purpose. UNESCO's research emphasizes that technology should support human interaction and learner interests rather than substitute them.

Strategic Roadmap for Viksit Bharat @2047:
Phase I: Foundation Building:
2026–2030
- strengthen school infrastructure;
- improve internet access;
- strengthen foundational literacy;
- introduce digital literacy;
- develop teacher digital competencies;
- expand vocational exposure.

Phase II: Integration:
2030–2040
- integrate AI literacy;
- strengthen school-industry partnerships;
- expand innovation laboratories;
- introduce competency-based assessment;
- develop multilingual digital resources;
- expand entrepreneurship education.

Phase III: Future-Ready Education:
2040–2047
- establish globally competitive learning ecosystems;
- strengthen research and innovation;
- promote lifelong learning;
- integrate advanced technologies responsibly;
- develop globally competent and socially responsible citizens.

Recommendations:
The following recommendations are proposed:
1. Every school should develop a basic digital education plan.
2. Digital infrastructure should be strengthened in rural and underserved areas.
3. Teacher training should include AI and digital pedagogy.
4. Skill education should be integrated into the school curriculum.
5. Students should receive practical exposure to vocational fields.
6. Schools should develop innovation and entrepreneurship clubs.
7. Digital content should be made available in Indian languages.
8. AI literacy should be introduced progressively according to age.
9. Cybersecurity and digital citizenship should become part of education.
10. Assessment should include projects and practical competencies.
11. Schools should collaborate with industries and higher education institutions.
12. Digital education should remain inclusive and accessible.
13. Parents should receive digital-literacy awareness.
14. Schools should monitor the educational—not merely technological—impact of digital initiatives.
15. Human interaction, physical education, arts, culture and values should remain integral to education.

Educational Implications:
For Teachers:
Teachers need continuous professional development in technology and competency-based pedagogy.

For Students:
Students should become active creators of knowledge rather than passive recipients.
For Schools:
Schools need to become innovation-oriented learning ecosystems.
For Policymakers:
Policy implementation should focus on equity, quality and measurable learning outcomes.
For Teacher Education Institutions:
Teacher education curricula should include digital pedagogy, AI literacy, educational technology and skill-based learning.

Limitations of the Study:
The study is conceptual and is based primarily on secondary sources. It does not include primary data collected directly from students, teachers or schools. Therefore, future studies may use:
- experimental research;
- survey research;
- case studies;
- longitudinal studies;
- comparative studies; and
- mixed-method research

to empirically examine the effectiveness of digital and skill-based educational interventions.

Suggestions for Future Research:
Future researchers can investigate:
1. Effectiveness of AI-based learning among school students.
2. Digital competency of teachers after NEP 2020 implementation.
3. Impact of vocational education on student career awareness.
4. Digital divide among rural and urban students.
5. Relationship between digital literacy and academic achievement.
6. Effectiveness of competency-based assessment.
7. Role of school innovation laboratories.
8. Impact of entrepreneurship education on students.
9. Teacher readiness for AI-integrated education.
10. Role of multilingual digital content in improving learning outcomes.

Conclusion:
The vision of Viksit Bharat @2047 requires a strong foundation of human capabilities. Education is not merely one component of national development; it is a major mechanism through which a nation develops its intellectual, technological, economic and social capacity.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

NEP 2020 provides a comprehensive framework for transforming Indian education into a more holistic, flexible, competency-oriented and multidisciplinary system. Its emphasis on experiential learning, vocational education, technology, critical thinking and holistic development is highly relevant to the requirements of a future-ready India. Digital transformation can provide powerful opportunities for improving access, personalization, collaboration and educational resources. However, technology must be implemented with appropriate pedagogy, teacher preparation, infrastructure, equity and ethical safeguards. UNESCO's evidence demonstrates that technology can support education but can also deepen inequality when access and implementation are inadequate. Skill-based education provides the bridge between knowledge and practical application. Students need to develop not only academic competencies but also digital literacy, communication, creativity, critical thinking, problem-solving, entrepreneurship, vocational competencies and adaptability. Therefore, the pathway towards Viksit Bharat @2047 should not be defined simply as **"**more technology in schools**."** It should be defined as: Better education through appropriate technology, meaningful skills, capable teachers, innovative pedagogy, equitable access and strong human values. The ultimate goal of educational transformation should be to create learners who are knowledgeable, skilled, innovative, ethical, confident, adaptable and socially responsible. Such learners will become the human capital capable of contributing to India's economic growth, scientific advancement, technological innovation, social development and global leadership. Thus, the successful integration of NEP 2020 + Digital Transformation + Skill-Based Education can serve as a strategic educational roadmap for realizing the vision of Viksit Bharat @2047.

Acknowledgement

The authors would like to express their sincere gratitude to all those who contributed directly or indirectly to the completion of this research paper entitled "NEP 2020, Digital Transformation and Skill-Based Education: A Roadmap for Viksit Bharat @2047." We are deeply grateful to the Ministry of Education, Government of India, and UNESCO for providing valuable policy documents, reports, and educational resources that served as important secondary sources for this conceptual and analytical study. The study draws upon NEP 2020, government publications, UNESCO reports, and relevant scholarly literature.

Abstract

In our country India has urbanized fast, and densely, and the toll from fire accidents has followed it every step of the way, mostly avoidably. The data received from the National Crime Records Bureau (NCRB) show reported fire incidents dropping from 18,450 in 2015 to 5,971 in 2024. But as on today fires still kill thousands of peoples in every year, though, and the pattern of major fatal incidents keeps repeating. In the year 2022 Mundka fire in Delhi, In the year 2024 Rajkot gaming-zone fire, in the year 2025 Gujarat firecracker-warehouse explosion, in the year 2025 Gulzar Houz fire in Hyderabad. These accidents are not isolated bad luck at all, they point to something structural. This paper looks at the mismatch between how vertically Indian cities are growing and how horizontally, ground-bound, their fire services are still designed. Building-plan authorities keep clearing multi-storey buildings and high-rise construction even though, in most cities, the fire brigade's aerial equipment tops out somewhere around the tenth to eighteenth floor. In the Mumbai city, there are high rise buildings upto 100 floors. Water supply for fire-fighting remains a logistical headache nobody has really solved. And the installation, upkeep, and inspection of in-building fire equipment is, in a large share of buildings holding a fire NOC, weak or close to nonexistent on the ground. This problem is against the Government of India's Viksit Bharat @2047 vision, which expects more than half the population to be living in cities that generate most of the country's GDP, the argument here is simple: fire safety cannot keep being treated as an afterthought of urban growth. It has to become one of the things holding that growth up. The paper ends with legal, institutional, and technological recommendations aimed at closing the gap between how tall India's buildings are getting and how far its fire services can actually reach, by 2047.

Keywords: *Fire Safety, High-Rise Buildings; Fire Accidents; Fire NOC; Urban Fire Services; Viksit Bharat @2047; Disaster Management*

Introduction

Fire, in India, has mostly been handled as a municipal nuisance to be put out rather than a risk that urban planning ought to be designed against from the start. Constitutionally, fire services sit under the local-government functions in the Seventh Schedule listed in Article 243-W, which makes them, in practice, something state governments and municipal bodies fund and staff. That arrangement made sense for a country of low-rise towns. It sits far less comfortably with India in 2026, where city skylines have shot up much faster than the fire and emergency response capacity meant to protect them. The re-development plans are raising the height of the building day by day. Almost every large Indian city now approves buildings of twenty, thirty, even fifty storeys, sanctioned under Floor Space Index (FSI) and Transferable Development Rights (TDR) rules built to absorb urban population pressure.

Quick Response Code:

Website: https://bnir.us

The same municipal corporations approving these towers, though, often run fire brigades whose tallest ladder or hydraulic platform cannot physically get past the tenth or eighteenth floor. What this produce is a widening "rescue gap" in most Indian cities, everything from roughly the fifteenth floor upward sits beyond what ground-based fire and rescue equipment can reach, which leaves occupants relying almost entirely on the building's own fire-safety systems. And those systems are frequently installed badly, maintained worse, or never actually tested. Two other structural problems make this worse. The first is water. Fire-fighting in Indian cities routinely competes with drinking-water supply on the same municipal network; hydrants are commonly broken, illegally tapped, or simply not there in older or unplanned areas; fire tenders often end up pulling water from tankers, static tanks, or whatever water body happens to be nearby, rather than a pressurized hydrant grid. The second is equipment. Fire extinguishers, wet risers, sprinklers, smoke detectors, and refuge floors required under the National Building Code (NBC) 2016 tend to get installed just well enough to secure a Fire No-Objection Certificate (NOC) at occupancy, after which inspection and maintenance quietly lapse because there is no real audit system to catch it. This paper places these operational and regulatory failures against India's longer-term development vision, Viksit Bharat @2047, under which India aims to become a developed, high-income economy by the hundredth anniversary of independence, with urban areas expected to house roughly half the population and generate close to three-quarters of GDP. A version of urban India that is economically productive but not safe to live in falls short of that vision on its own terms. Fire-safety infrastructure, then, is not a peripheral municipal service. It belongs in the same category as water, power, and transport: core urban infrastructure.

Literature Review

There is a fair amount of official and policy writing documenting how structurally weak India's fire and emergency services are. The Ministry of Home Affairs, in a 2019 reply to the Rajya Sabha drawing on a study by Risk Management Solutions Inc. (commissioned against a 2012 baseline), found a nationwide shortage of roughly 90 per cent in fire-service manpower, about 61 per cent in the number of fire stations (only 2,087 to 3,377 of a required 8,559 in place, depending on which year's assessment is used), and roughly 78 per cent in fire-fighting equipment and vehicles. The Standing Fire Advisory Council (SFAC), the apex technical body under the Ministry of Home Affairs, sets population- and risk-based norms, such as one fire station for every 50,000 residents and a graded scale of fire tenders per unit population, against which most Indian cities, state capitals included, fall well short. Looking at individual incidents reinforces the same pattern. Investigations into the 2022 Mundka fire in Delhi (27 deaths) found the building had no fire department clearance and lacked even basic extinguishers. The 2024 Rajkot gaming-zone fire (32 deaths) happened in a temporary structure without the required fire NOC and with inadequate exits. The 2025 Deesa (Gujarat) firecracker-warehouse explosion (21 deaths) involved a facility operating on a lapsed licence. The 2025 Gulzar Houz fire in Hyderabad (17 deaths) spread fast through a building with wooden interiors and poor ventilation. Journalistic and RTI-based reporting out of Mumbai has shown that the city's fire brigade ladders max out at roughly ninety metres, about thirty floors, even though several residential towers already exceed that height, and that high-rise fire incidents there happen, on average, more than once a week. Across the technical and policy commentary, three themes keep coming up. First, NBC 2016's fire and life-safety provisions are often treated by local bodies as advisory rather than binding, and the Code itself allows discretionary exemptions "to avoid unnecessary hardship." Second, Fire NOCs are commonly issued on paper without any real follow-up inspection, so sprinklers and smoke detectors that were installed simply fall out of use. Third, urban water infrastructure in India was never designed with fire-flow, meaning pressurized water continuously available for fire-fighting, as a planning consideration, which leaves hydrant networks patchy, unpressurised, or absent altogether across large parts of many cities. NCRB's Accidental Deaths and Suicides in India (ADSI) reports remain the main national source for fire-incident data, though researchers point out that the narrower category of "fire accidents" is often confused with the broader category covering all fire and burn-related deaths, which is why the figures cited across different sources vary so much.

Research Gap

Existing scholarship covers the manpower and infrastructure shortfall in Indian fire services, and separately, the technical detail of the National Building Code. Three connections between them, though, remain largely unexamined. First, the causal link between municipal building-sanction practices (the FSI/TDR-driven push toward vertical growth) and the operational ceiling of urban fire

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

brigades has rarely been treated as one connected planning failure rather than two administrative silos that happen to sit next to each other. Second, water infrastructure planning, as distinct from fire-tender or manpower shortages, has received comparatively little systematic attention as an independent bottleneck in Indian legal and policy scholarship on fire response. Third, hardly any work ties India's fire-safety deficit back to the long-term Viksit Bharat @2047 framework, despite that framework leaning explicitly on high-density, high-rise urbanisation to drive GDP growth. This paper tries to bring these three threads together.

Research Objectives

1. To examine the regulatory and institutional mismatch between building-sanctioning practices for multi-storey and high-rise construction and the operational capacity of urban fire and emergency services in India.
2. To analyse water supply as a distinct structural constraint on effective fire-fighting in Indian cities.
3. To assess how adequately in-building fire-fighting equipment is installed, maintained, and audited under the National Building Code, 2016 and related Model Building Bye-Laws.
4. To weigh these findings against the goals of Viksit Bharat @2047 and to recommend legal, institutional, and technological measures that would close the gaps identified.

Research Questions

Why do municipal authorities keep sanctioning high-rise buildings without a matching, verified upgrade in fire-fighting reach and response capacity?

What legal and infrastructural reforms would actually resolve the water-supply constraint on fire-fighting in Indian cities?

Why does the Fire NOC regime fail to keep installed fire-safety equipment functioning over time, rather than just certifying that it was installed once?

What kind of institutional set-up would let India's fire and emergency services keep pace with the scale of urbanisation that Viksit Bharat @2047 envisages?

Research Methodology

1. Nature of Study

This is a doctrinal, descriptive, and analytical study. It does not generate new field data; instead, it draws together and critically examines statutory provisions, official data, and secondary reportage to pick out the systemic patterns running through them.

2. Sources of Data

The paper draws on secondary sources: the National Building Code of India, 2016 (Part 4, Fire and Life Safety); the Model Building Bye-Laws, 2016 issued by the Ministry of Housing and Urban Affairs; Standing Fire Advisory Council norms and Ministry of Home Affairs parliamentary replies; NCRB's Accidental Deaths and Suicides in India (ADSI) reports; NITI Aayog and government material on Viksit Bharat @2047; and verified reportage on major fire incidents, RTI disclosures, and policy commentary.

3. Method of Analysis

The analysis works through four steps. First, it traces the statutory and institutional framework governing fire safety and municipal fire services in India. Second, it sets documented capacity data, covering fire-station, personnel, and equipment shortfalls, and aerial-appliance height limits, against the actual height profile of buildings being sanctioned in major cities. Third, it looks at water-supply and equipment-maintenance failures as separate but compounding constraints. Fourth, it maps all of this onto the stated goals of Viksit Bharat @2047 to work out what policy interventions are actually needed.

4. Scope and Limitations

The study is focused on urban, multi-storey and high-rise fire safety and municipal fire-service capacity. It does not get into forest fires, industrial process-safety regulation under separate statutes (such as the Petroleum and Explosives Safety Organization regime), or rural fire incidents in any depth. Reported fire-death statistics vary across sources depending on how they are classified, NCRB's narrower "fire accidents" category versus the broader fire/burn-related accidental death figures used in some secondary literature, and that variance is flagged wherever it comes up rather than resolved through independent verification, which sits outside the doctrinal scope of this paper.

Analysis and Findings

1. The statutory and institutional framework

Fire services in India are, constitutionally, a municipal function, but the technical content of fire safety is set at the national level through the National Building Code, 2016. Part 4 of the Code lays down requirements for means of escape, fire-resistant construction, fire lifts, refuge areas, automatic sprinklers, and fire detection and alarm systems, particularly for buildings above certain height thresholds (historically 15 metres, with some recent state-level revisions pushing this to 24 metres). The Ministry of Housing and Urban

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Affairs' Model Building Bye-Laws, 2016 are meant to help states fold these NBC provisions into local building-approval processes. The Standing Fire Advisory Council, set up in 1956 and functioning under the Ministry of Home Affairs, lays down population-based norms for fire stations, tenders, and personnel, and periodically checks how states are complying. The real weakness is enforceability. The NBC is only recommendatory unless a state specifically adopts it through legislation or municipal bye-laws, and even where it has been adopted, it lets local heads and fire services grant exemptions "to avoid unnecessary hardship." Because fire-safety approval (the Fire NOC) and building-plan approval are usually handled by separate departments with little real-time coordination between them, a building can, in practice, get construction and occupancy clearance while its fire-safety compliance is only partial, exists only on paper, or lapses once the NOC's validity period (commonly three years) runs out without renewal.

2. The height-versus-reach mismatch

The capacity data shows the same pattern across Indian cities: aerial fire-fighting and rescue equipment tops out well below the height of buildings routinely being approved. In Mumbai, one of India's most vertically built-up cities, the fire brigade's tallest ladder reaches around ninety metres, about thirty floors, yet the city already has under-construction towers exceeding 300 metres, and RTI data has shown high-rise fire incidents there happening on average more than once every two days between 2008 and 2018. In Gurugram, the fire department's hydraulic platform reaches the fourteenth floor (about forty-two metres), while more than two hundred buildings in the city are taller than that. In Bengaluru, the state government has bought aerial ladders that reach the seventeenth-to-eighteenth floor and the tenth-to-eleventh floor respectively, procured specifically after a high-rise fire tragedy. In Chandigarh, only about a fifth of the high-rise buildings surveyed held a valid fire safety certificate, despite it being mandatory under the NBC. This comes down to two things: a physical engineering constraint, since taller aerial appliances need bigger vehicles, wider access roads, and larger turning radii than many Indian streets can offer, and a resource constraint, since high-reach platforms are expensive and cities with tight fire budgets tend to prioritise ground-level and mid-rise coverage instead. The upshot is that fire safety on the upper floors of most Indian high-rises rests almost entirely on the building's own passive protection (fire-rated compartmentation, protected staircases, refuge floors) and active protection (sprinklers, wet risers, pressurised stairwells) working properly when an incident actually happens, which is exactly what audits keep finding is poorly maintained or simply not working.

3. Water supply as an independent bottleneck

Effective fire suppression needs a continuous, pressurised water supply, whether through hydrants, static tanks, or bulk tankers. In most Indian cities, though, municipal water networks were built primarily for intermittent domestic supply rather than continuous fire-flow, and dedicated fire-hydrant grids are often missing, unpressurised, illegally tapped for domestic use, or buried under later road and utility work. Fire tenders in many cities end up pulling water from static tanks, borewells, lakes, or tanker convoys instead of a hydrant network, which slows response considerably, especially for fires above the reach of fire-tender hoses on upper floors, where internal wet-riser and sprinkler systems, dependent on a building's own overhead or underground water storage, become the only realistic means of suppression. Where these in-building tanks are undersized, shared with domestic use, or left empty to save money, the building effectively has no independent way of fighting an upper-floor fire no matter how fast the fire brigade arrives. Water scarcity gets worse in the summer, when municipal reservoirs are already stretched by drinking-water demand and heatwave-linked electrical fires, a recognised seasonal driver of urban fire incidents, become more frequent, so the period of peak fire risk lines up almost exactly with the period of least available fire-flow water.

4. Installation versus functional maintenance of fire equipment

A finding that keeps coming up across post-incident inquiries is that fire-fighting equipment was either never installed, installed but not working, or installed and working but not maintained. Fire NOCs are typically issued after a single inspection and renewed only periodically (commonly every three years), and municipal fire departments are themselves too short-staffed for the volume of inspections that would be needed, so there is little capacity for surprise audits or ongoing checks on sprinkler pressure, extinguisher charge, alarm functionality, or whether fire-rated doors are properly sealed, all of which degrade or get tampered with, for storage convenience, say, between formal inspections. Building owners and occupiers, especially in commercial and mixed-use buildings, often treat fire-safety installations as a one-time cost to clear for occupancy certification rather than an ongoing operational requirement,

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

and without a mandatory third-party fire-audit regime carrying real penalties for non-compliance, this gap can sit undetected for years until an actual fire exposes it.

5. Aggregate manpower and infrastructure deficit

The scale of the underlying resourcing gap is well documented: as of the most recent parliamentary disclosure on the subject, India's fire services had a manpower shortage of roughly 90 per cent against assessed requirement, an equipment and vehicle shortage of roughly 78 per cent, and a fire-station shortage of roughly 61 per cent nationally, with the gap proportionally worse in fast-growing urban areas than the national average suggests. City-level assessments echo this at a smaller scale; Bengaluru's fire department, for instance, has been assessed as running with well under a third of the fire stations and tenders that SFAC norms recommend for a city of its size and risk profile. The 15th Finance Commission has set aside several thousand crore rupees for "Modernisation of Fire Services," and part of urban local body grants is tied to disaster-management capability, but implementation has been uneven across states, since fire services remain a state and municipal subject with fiscal capacity and political priority that vary widely from place to place.

6. Implications for Viksit Bharat @2047

Viksit Bharat @2047 imagines India as a high-income economy worth somewhere around USD 30 to 40 trillion by its hundredth year of independence, with urban areas expected to house close to half the population and generate a growing majority of GDP, driven largely by continued high-density, high-rise construction. That vision is, by its own logic, a vision of vertical growth. If fire and emergency-response capacity does not keep pace, in reach, in water-supply engineering, and in how rigorously equipment is audited, the same vertical growth meant to power the Viksit Bharat economy will also expand the number of people living and working beyond the state's effective rescue reach. Developed-nation status measured only in GDP, without asking whether someone above the fifteenth floor can actually be rescued from a fire, would fall short of the fuller idea of "developed" that the government's own framing of Viksit Bharat, institutional resilience alongside economic productivity, is supposed to aim for.

Recommendations

Drawing on the literature review, the sources examined, and the analysis above, the following recommendations are made:

1. Build fire-service capacity certification into the building-sanction process itself, so that no high-rise plan above a defined height threshold is approved unless the local fire department certifies, in writing and against its actual current equipment inventory, that it can provide rescue and suppression coverage up to that height, or that the building's own passive and active fire-safety design makes up for any verified gap in external reach.
2. Require fire-flow-specific water infrastructure in urban planning, including dedicated, pressurised hydrant networks kept separate from domestic supply, minimum in-building fire-water storage scaled to a building's height and occupancy, and regular, not one-time, testing of hydrant pressure and in-building tank adequacy.
3. Turn the Fire NOC from a one-time or three-yearly paper certificate into a system of mandatory, unannounced, third-party fire audits, on the model of statutory financial audits, with graded penalties, including suspension of occupancy, for buildings that fail to keep their fire-safety systems functional between renewal cycles.
4. Speed up procurement of high-reach aerial appliances, robotic and drone-based fire-fighting equipment, and mutual-aid or regional fire-response sharing arrangements between neighbouring municipalities, funded through ring-fenced Finance Commission and urban local body grants earmarked for fire-service modernisation, with disbursement tied to outcomes.
5. Give NBC 2016 Part 4's fire-safety provisions clear, mandatory legal status through uniform state legislation, and remove the discretionary exemption clauses for occupied buildings above defined height and occupancy-risk thresholds.
6. Build fire-service capacity planning explicitly into Viksit Bharat @2047's urban infrastructure targets, treating fire and emergency response as core infrastructure on par with water, power, and transport, with measurable, publicly reported targets for fire-station density, personnel strength, and aerial-reach coverage in every city that crosses defined population and building-height thresholds.
7. Improve public data transparency by requiring NCRB and state fire departments to publish standardised, disaggregated data on fire incidents by building height, cause, and outcome, so that policy can be monitored on evidence rather than relying on inquiry commissions set up after each tragedy.

Conclusion

India's fire-safety crisis is not a string of unconnected accidents. It is the visible symptom of a structural mismatch between how Indian cities are allowed to grow and how well they are protected while doing so. Municipal authorities keep sanctioning taller and taller buildings while the fire and emergency services meant to protect the people inside them remain limited by aerial appliances that cannot physically reach past the tenth to eighteenth floor in most cities, by water infrastructure that was never built for sustained fire-flow, and by a fire-NOC regime that certifies installation but rarely checks whether anything still works. NCRB data showing a decline in reported fire accidents and deaths over the past decade should not distract from the recurring, high-fatality incidents, in Delhi, Rajkot, Gujarat, Hyderabad, and plenty of other places, that keep exposing the same underlying gaps. As India works toward the Viksit Bharat @2047 vision of a developed, high-income, mostly urban nation, fire safety needs to be treated as core infrastructure rather than a residual compliance box to tick, built into building sanction, water-supply planning, and municipal finance from the start. A developed India by 2047 should be one where the height of a building no longer decides how far its occupants are from being rescued.

Acknowledgement

I would like to express my sincere gratitude to all those who contributed, directly or indirectly, to the completion of this research paper titled "Fire Accidents in our Nation, Regulatory Gaps, Fire-Fighting Capacity in the Urban, and the Challenges for the concept of Viksit Bharat @2047." I am deeply grateful to my teachers, mentors, and cademic guides for their valuable guidance, constructive suggestions, and continuous encouragement hroughout the research process. Their academic support helped me develop a better understanding of the legal, regulatory, institutional, and infrastructural dimensions of urban fire safety in India.

Financial support and sponsorship

Abstract

AI agents are moving from systems that only generate information to systems that can plan tasks, use tools, and perform operations through external APIs. This shift creates a security problem that traditional permission models do not fully address: an agent may hold broad privileges even when a particular task needs only a small part of that access. A valid token therefore does not automatically mean that every action produced by the agent is appropriate. This paper proposes DPMF (Dynamic Risk-Aware Permission Framework), an external authorization layer for AI agents that interact with third-party services. DPMF evaluates each proposed API action using contextual signals such as user-intent alignment, data sensitivity, permission severity, source trust, action reversibility, and behavioral deviation. The resulting risk level drives one of four decisions: Allow, Restrict, Human Approval, or Deny. The framework also separates the agent's ability to propose an action from the security layer's authority to approve it. The paper presents the framework architecture, threat model, risk-scoring approach, dynamic permission algorithm, case study, and an experimental methodology for comparing DPMF with static authorization. Because the framework has not yet been experimentally implemented, no numerical performance claims are presented as established results. Instead, measurable evaluation criteria and expected outcomes are defined.

Keywords: *AI agents; agentic AI; API security; dynamic authorization; risk-based access control; least privilege; prompt injection; human-in-the-loop.*

Introduction

Artificial intelligence has gradually moved beyond the role of a conversational assistant. Modern AI agents can interpret a request, plan a sequence of steps, select tools, retrieve information, and carry out actions in external systems. This capability is valuable in productivity software, enterprise automation, software development, customer support, and information management. The same capability, however, changes the security problem. An incorrect answer may be inconvenient, but an incorrect API operation can change data, send a message, disclose information, or alter an account. Consider a simple request: "Find tomorrow's meeting information and prepare a summary." A calendar read operation is normally sufficient. Yet an integrated agent may also possess permission to send email, create or delete calendar events, modify documents, access cloud files, or change account settings. Those permissions may have been legitimately granted at the application level, but they are not necessarily justified by the current task. This distinction matters because AI agents operate through plans generated from natural-language goals and contextual information

Quick Response Code:

Website: https://bnir.us

Their next action can be influenced by tool responses, documents, web pages, emails, and other external content. Such content may be unreliable or deliberately crafted to change the agent's behavior. If the agent can directly exercise broad credentials, manipulation at the model or data level can become a real-world security event.

Motivation for Action-Level Authorization

The principle of least privilege states that an entity should receive only the authority needed for its intended operation. Applying this principle to AI agents is more difficult than applying it to a fixed software workflow because the required authority changes with the task. Reading a calendar event, creating an event, and deleting an event are not equivalent actions even though they may belong to the same API.

Task	Required capability	Relative consequence
Read an event	Calendar.Read	Low
Create an event	Calendar.Write	Moderate
Delete an event	Calendar.Delete	High

DPMF addresses this problem by placing an independent authorization layer between the agent and the third-party API. The agent proposes an operation; the authorization system evaluates whether that operation fits the user's task and determines the smallest acceptable permission scope.

2. Background and Related Work

1. AI Agents and Tool Use

An AI agent generally combines a language model with contextual information, planning, decision-making, and access to tools. A typical interaction begins with a user request, followed by interpretation of the goal, selection of a tool, construction of an API request, receipt of a response, and continuation of the task. Tool use is what allows an agent to move from recommending an action to actually performing it. Common integrations include calendars, email, cloud storage, databases, customer-management systems, search services, and enterprise applications. Every integration expands the agent's operational surface. Security therefore depends not only on the model, but also on the tools, permissions, external data, API boundaries, and combinations of actions that the agent can reach.

2. Third-Party API Dependency

A single API permission may appear harmless when considered alone, while a sequence across multiple APIs can create a much larger risk. For example, an agent might read a confidential document through cloud storage, obtain an external address, and then send the document using an email service. Each individual operation can be technically permitted, yet the combined behavior can clearly exceed the purpose of the user's request.

3. Security Concerns in Agentic Systems

- Direct prompt injection: a user-supplied instruction attempts to redirect the agent.
- Indirect prompt injection: malicious instructions are embedded in web pages, emails, documents, search results, or API responses.
- Excessive permissions: the agent has more authority than the current task requires.
- Malicious tool output: information returned by a tool influences a later action in an unsafe way.
- Cross-API abuse: individually legitimate operations are combined to produce an unintended result.
- High-impact actions: deletion, data sharing, financial operations, or permission changes have consequences that require stronger control.

4. Research Positioning

The source paper recognizes that AI-agent authorization is already being studied through role-based access control, intent-based authorization, delegation, and trust-oriented approaches. DPMF therefore does not claim that dynamic authorization itself is a completely new idea. Its research focus is the practical integration of several contextual signals into one experimentally testable API authorization pipeline. The proposed combination includes intent alignment, operation sensitivity, data sensitivity, source trust, reversibility, behavioral deviation, dynamic permission narrowing, and external policy enforcement.

3. Problem Statement, Research Gap and Objectives

1. Problem Statement

Current AI-agent integrations commonly rely on credentials, OAuth scopes, roles, or predefined API permissions. These mechanisms remain important, but they answer a narrower question: whether an agent is authorized to access a service. They do not necessarily determine whether the particular action generated at a particular moment is consistent with the user's intention. For example, an agent may hold calendar.read, calendar.write, and calendar.delete while the user has only requested a

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

meeting summary. If a malicious instruction inside a meeting description causes the agent to request access to confidential files, the credential may still be valid even though the action is unrelated to the task. The central distinction can therefore be expressed as:

Valid authentication ≠ valid intent

Valid API permission ≠ valid action

The research problem addressed by DPMF is: How can an AI agent's permissions be dynamically controlled at the API-action level according to task context and security risk while preserving legitimate task functionality?

2. Research Gap

The practical gap investigated here is not the absence of authorization methods, but the lack of a unified action-level mechanism that combines multiple contextual signals before an AI-generated API request reaches a protected service. The framework specifically focuses on third-party API interactions, where an agent can move from information retrieval to consequential operations.

3. Research Objectives

1. Identify security risks associated with AI agents that use third-party APIs.
2. Design a dynamic, risk-aware authorization framework for agent-generated API calls.
3. Develop an action-level contextual risk score.
4. Dynamically narrow permissions to the smallest scope required by the current task.
5. Place an independent authorization layer outside the language model.
6. Identify high-risk actions that should require human approval.
7. Compare dynamic authorization with conventional static authorization.
8. Measure security effectiveness, task completion, and authorization overhead.

4. Research Questions

- RQ1: What security risks arise when AI agents are given access to multiple third-party APIs?
- RQ2: Can contextual risk factors improve authorization decisions for AI-agent API calls?
- RQ3: Can dynamic permission narrowing reduce excessive and unauthorized API operations compared with static permissions?
- RQ4: How does dynamic authorization affect legitimate task completion?
- RQ5: Which combination of contextual factors is most useful for identifying high-risk agent actions?

4. Research Hypotheses and Threat Model

1. Research Hypotheses

- H1: A dynamic risk-aware permission framework will reduce unauthorized API actions compared with a static permission model.
- H2: Dynamic permission narrowing will reduce excessive privilege exposure while maintaining an acceptable legitimate-task success rate.
- H3: A risk model combining intent alignment, data sensitivity, permission severity, source trust, reversibility, and behavioral deviation will support more effective authorization decisions than a single-factor model.
- H4: External policy enforcement will block a subset of malicious API actions even when the AI agent has been manipulated.

2. Threat Model

The threat model assumes an AI agent connected to several external APIs. The attacker may attempt to influence the agent directly, manipulate information that the agent consumes, exploit excessive permissions, or induce high-impact actions.

Threat	Typical entry point	DPMF response
Direct prompt injection	User input	Re-evaluate proposed action
Indirect prompt injection	Email, webpage, document	Treat source as contextual risk
Malicious tool output	API/tool response	Do not allow output to expand authority
Excessive permission request	Agent-generated scope	Narrow to task-required scope
Unauthorized data access	Sensitive resource	Increase risk / deny
Destructive action	Delete/change/transfer	Human approval or deny
Cross-API abuse	Multiple services	Evaluate each action in session context

3. Security Assumption

DPMF does not assume that the language model will always resist manipulation. Instead, it assumes that the model may occasionally produce an unsafe or unexpected API request. The security objective is to prevent such a proposal from automatically becoming an authorized external action. This is a deliberate architectural choice. Prompt-level safeguards remain useful, but they are not treated as the final security boundary. The final decision is made by a component that can inspect the requested operation, scope, context, and policy before execution.

Proposed DPMF Architecture

DPMF is designed as an external authorization pipeline. Its central principle is simple: the AI agent can propose an action, but it cannot unilaterally authorize that action. Every proposed API

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

operation passes through the security layer before reaching the third-party service.

1. Main Components

1. User Intent Analyzer: Identifies the user's goal, expected resources, and expected operation so that later requests can be checked against the original purpose.

2. AI Agent: Interprets the request, plans the task, and selects tools. It does not receive unrestricted authority.

3. Tool/API Request Interceptor: Intercepts every API request generated by the agent before it reaches the protected service.

4. Context Collector: Gathers the request, API operation, resource, sensitivity, instruction source, session history, previous actions, and reversibility information.

5. Risk Assessment Engine: Combines contextual factors into an action-level risk assessment.

6. Dynamic Permission Engine: Determines the minimum permission and resource scope required for the current operation.

7. Policy Enforcement Gateway: Enforces the final decision: allow, restrict, require approval, or deny.

8. Human Approval Module: Pauses high-impact operations until an authorized user or administrator confirms them.

9. Audit and Monitoring System: Records requests, risk assessments, decisions, and relevant actions for review and security analysis.

2. Authorization Flow

User request → AI agent → proposed API action → request interceptor → context collection → risk assessment → permission decision → policy enforcement → third-party API → audit log.

The architecture creates a clear separation between task execution and security enforcement. This makes it possible to apply the same policy layer to different agents and APIs, provided suitable API adapters translate each service's permission model into the framework's common authorization representation.

3. Design Principle

The security layer should be independent enough that an agent cannot modify its own authorization rules, increase its own scope, or bypass the gateway by directly contacting a protected API. This component is therefore security-critical and must itself be protected, monitored, and tested.

Risk Assessment and Dynamic Permission Model

DPMF evaluates risk at the level of an individual API action. The proposed model uses six contextual factors. Each factor can initially be normalized to a 0–1 range, with higher values representing greater risk.

Factor	Low-risk condition	High-risk condition
Intent mismatch (I)	Action directly supports task	Action unrelated to task
Data sensitivity (D)	Public / low sensitivity	Highly confidential data
Permission severity (P)	Read / low privilege	Administrative / destructive
Source trust (S)	Trusted user/system source	Untrusted external content
Reversibility (R)	Easily reversible	Irreversible consequence
Behavioral deviation (B)	Normal for current task	Unexpected or abnormal action

1. Risk Score

A weighted model can be represented conceptually as:

Risk = wI·I + wD·D + wP·P + wS·S + wR·R + wB·B

Here, I, D, P, S, R, and B represent the normalized risk factors and the w terms represent experimentally determined weights. The original framework intentionally leaves the weights open because assigning them without empirical validation could make the resulting thresholds arbitrary.

6.2 Four Authorization Decisions

Decision	Meaning	Illustrative example
ALLOW	Low-risk action aligned with the task.	Read tomorrow's calendar event.
RESTRICT	Legitimate action, but requested scope is larger than needed.	Read one document instead of the entire drive.
HUMAN APPROVAL	Potentially legitimate action with significant consequences.	Send email, delete file, change account settings.
DENY	Action conflicts with intent or violates policy.	Meeting-summary task triggers access to confidential employee records.

3. Dynamic Permission Narrowing

The key difference from static authorization is that the agent does not continuously operate with its maximum available scope. Instead, DPMF maps the current task to the required operation and minimum resource scope. For example, a request to read tomorrow's meeting may result in Calendar.Read limited to tomorrow's events. Once the task is completed, the temporary permission can expire.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Case Study and Authorization Algorithm

1. Case Study: Meeting Agenda Summary

Assume an AI agent is connected to Gmail, Google Calendar, and Google Drive. The user asks: "Find tomorrow's meeting agenda and summarize it." The intent analyzer classifies the task as information retrieval and summarization. The expected resource is the calendar and the expected operation is read.

Factor	Illustrative score	Reason
Intent mismatch	0.0	Calendar read directly supports the task.
Data sensitivity	0.2	Meeting information may contain limited sensitive content.
Permission severity	0.1	Read-only operation.
Source trust risk	0.1	Normal calendar source.
Reversibility risk	0.0	No modification occurs.
Behavioral deviation	0.0	Action follows the expected workflow.

Illustrative decision: ALLOW. The numerical values are examples for explaining the model, not experimental findings.

2. Manipulated Scenario

Now suppose the meeting description contains hidden or malicious text telling the agent to ignore the original task, search the user's Drive, and send confidential documents to an external address. The agent may follow the instruction and propose Drive.Read followed by Email.Send. DPMF evaluates these operations against the original intent and current context.

Action	Intent mismatch	Data sensitivity	Behavioral deviation	Decision
Drive.Read	High	High	High	DENY
Email.Send	Very high	High	High	DENY

The important security property is not that the model remains perfectly obedient. It is that a manipulated model cannot use the manipulation as a direct path to greater authority. The gateway can block the proposed operation even though the underlying credentials are valid.

3. Dynamic API Authorization Algorithm

1. Extract the original user intent.
2. Identify the requested API, operation, resource, and data type.
3. Determine the minimum permission needed for the action.
4. Calculate intent mismatch and data-sensitivity values.
5. Evaluate permission severity, source trust, reversibility, and behavioral deviation.
6. Combine the factors into an overall risk score.
7. Compare the score with policy thresholds.
8. Allow low-risk actions; restrict moderate-risk scope; request human approval for high-risk actions; deny policy-violating actions.
9. Record the decision and return the authorization result.

Experimental Methodology

The proposed framework should be evaluated through a controlled prototype rather than through assumed performance. The study compares two otherwise similar configurations: a conventional static-authorization agent and an agent operating through the DPMF gateway. The same models, tasks, APIs, and attack scenarios should be used wherever possible so that differences can be attributed to the authorization mechanism.

1. Experimental Groups

- Group A – Static Authorization: the agent receives predefined API permissions for the session.
- Group B – DPMF: each proposed operation passes through the dynamic authorization gateway.

2. Controlled Dataset

A synthetic benchmark can include legitimate and adversarial tasks across several API categories:

API category	Example operations
Calendar	Read, create, modify, delete event
Email	Read, search, draft, send
Cloud storage	Read, create, modify, delete, share
Database	Read, insert, update, delete

3. Attack Scenarios

- A1 – Direct prompt injection: the attacker explicitly asks the agent to ignore the original task.
- A2 – Indirect prompt injection: malicious instructions are inserted into a document or webpage.
- A3 – Data injection: attacker-controlled metadata or structured content attempts to influence the next action.
- A4 – Excessive permission request: the agent asks for a broader scope than the task requires.
- A5 – Cross-API abuse: multiple legitimate services are combined for an unintended outcome.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

- A6 – Destructive action: the agent attempts an irreversible operation without appropriate authorization.

4. Evaluation Metrics

Metric	Purpose	Desired direction
Unauthorized Action Rate	Measures actions that should not have been executed.	Lower
Excessive Permission Rate	Measures unnecessary privilege exposure.	Lower
Legitimate Task Success	Measures useful task completion.	Higher
False Denial Rate	Measures legitimate actions incorrectly blocked.	Lower
Human Approval Rate	Measures frequency of intervention.	Context-dependent
Authorization Latency	Measures added processing time.	Lower
Risk Classification Accuracy	Measures low/high-risk classification quality.	Higher

Expected Findings, Security Analysis and Discussion

Because the proposed work has not yet been experimentally implemented, the expected findings should be treated as hypotheses rather than established results. The central expectation is that static permissions will provide broad autonomy but expose the agent to unnecessary authority, while DPMF will trade some additional authorization overhead for tighter action-level control.

1. Expected Security Benefit

DPMF should reduce excessive privilege exposure by limiting an agent to the authority required for the current task. If an unexpected API request is generated after prompt injection or malicious external data, the gateway can evaluate the request independently rather than accepting it simply because the token is valid.

2. Protection Against Key Threats

Threat	How DPMF responds	Important limitation
Excessive privilege	Narrow permissions to the current task and resource.	Intent detection may be imperfect.
Indirect prompt injection	Evaluate the resulting API action independently.	Does not stop model manipulation itself.
Malicious data	Treat external data as a risk signal, not a source of authority.	Source trust is difficult to score perfectly.
Destructive actions	Require approval or deny based on risk and policy.	Approval workflows add friction.
Cross-API abuse	Evaluate each operation using session context.	Complex workflows may be harder to classify.

3. Advantages

- Context awareness: permissions reflect the current task.
- Least privilege: only the necessary authority is exposed.
- External enforcement: the model does not make the final security decision.
- Human oversight: high-impact operations can be paused for approval.
- Auditability: decisions can be recorded for investigation and review.
- API independence: the concept can be adapted to different agents and third-party services.

4. Limitations

- Natural-language intent can be ambiguous.
- Risk scores depend on the quality and completeness of context.
- Weights and thresholds require empirical calibration.
- Dynamic checks add computational and network overhead.
- Overly strict policies may reduce agent usefulness.
- The authorization gateway itself becomes a security-critical component.
- Different APIs expose different permission models and may require adapters.

These limitations mean DPMF should be viewed as one security layer within a broader defense-in-depth strategy, not as a complete solution to every AI-agent security problem.

Future Work, Privacy Considerations and Conclusion

1. Future Work

- Machine-learning-based risk prediction using historical action patterns.
- Continuous trust evaluation for the agent, user, tool, API, and session.
- Adaptive permission expiration after task completion, session termination, or a defined time period.
- Multi-agent authorization for systems in which one agent delegates work to another.
- Dedicated detection for emerging agent-data-injection attacks.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

- Short-lived cryptographic authorization tokens containing the permitted API, operation, resource, purpose, and expiry.

Ethical and Privacy Considerations

A dynamic authorization system may process information about user requests, resources, and API operations. The implementation should therefore minimize personal-data collection and avoid placing unnecessary private content in audit logs. Where possible, logs can retain operational metadata such as operation type, risk score, decision, timestamp, and resource category. Authorization decisions should also be understandable enough for administrators and users to determine why an operation was allowed, restricted, approved, or denied.

Conclusion

AI agents are changing software security because they can move from generating information to taking actions through external services. The central challenge is therefore not only whether an agent is authenticated, but whether the specific action it proposes is appropriate for the user's current task. DPMF addresses this challenge by introducing an independent, risk-aware authorization layer between an AI agent and third-party APIs. The framework evaluates user-intent alignment, data sensitivity, permission severity, source trust, reversibility, and behavioral deviation. Based on the resulting context, it can allow an operation, narrow its scope, require human approval, or deny it. The most important architectural idea is the separation of proposal from authorization. An AI agent may generate a useful plan or an unsafe request, but the security gateway remains responsible for deciding whether the requested external action is permitted. This design can limit the impact of prompt injection, malicious data, excessive permissions, and unintended cross-API behavior. The proposed research deliberately avoids presenting unmeasured numerical improvements as results. Its next step is implementation and controlled evaluation against static authorization using unauthorized-action rate, excessive-permission rate, legitimate-task success, false denial rate, authorization latency, human approval rate, and risk-classification accuracy. Ultimately, secure autonomy should not mean giving an AI agent unlimited authority. It should mean giving the agent the minimum authority required for the task, within the appropriate scope and time period, with stronger verification when the consequences are significant.

Acknowledgement

The author would like to express sincere gratitude to all those who contributed directly or indirectly to the completion of this research work entitled "DPMF: A Dynamic Risk-Aware Permission Framework for Securing AI Agents Using Third-Party APIs." The author gratefully acknowledges the support and encouragement received from the Department of Computer Science/Information Technology, Thakur Ramnarayan College of Arts and Science, Dahisar East, which provided a supportive academic environment for undertaking this research.

Abstract :

Viksit Bharat @2047 aims to build a developed, technologically advanced, economically resilient and sustainable India. Achieving this vision requires integrating Artificial Intelligence (AI), mathematics, physics, digital commerce and sustainability. This paper proposes a framework called Mathematical-Physical Intelligence (MPI), combining mathematical modelling, physical sciences, AI and digital economic systems for intelligent decision-making. Mathematical tools such as optimization, probability, statistics, graph theory and differential equations support complex problem-solving. Physics enables technologies including semiconductors, renewable energy, quantum computing, sensors and communication networks. AI transforms data into predictive and prescriptive decisions across energy, agriculture, healthcare and finance. Digital commerce connects these technologies with economic activities and value creation. Sustainability constraints ensure that technological and economic growth remains environmentally responsible. The MPI framework can support India's transition towards a knowledge-driven, innovative and sustainable developed economy by 2047.

Keywords: *Artificial Intelligence, Mathematical Modelling, Physics, Sustainable Development, Viksit Bharat @2047.*

Introduction

India is undergoing rapid transformation through digital connectivity, artificial intelligence, financial technology, advanced manufacturing, renewable energy and entrepreneurship. The vision of Viksit Bharat @2047 requires these developments to evolve into an interconnected national innovation ecosystem. Artificial Intelligence can process large volumes of data and support intelligent decision-making, but it fundamentally depends on mathematics, including linear algebra, probability, statistics, optimization and calculus. Emerging technologies such as semiconductors, optical communication, quantum computing, renewable energy, sensors and satellite systems are based on principles of physics. The digital economy connects technological capabilities with economic activities through digital payments, e-commerce, digital banking and intelligent supply chains. However, economic growth must be balanced with energy efficiency, resource conservation, environmental protection and social inclusion. This research therefore proposes an interdisciplinary framework integrating mathematics, physics, artificial intelligence, digital commerce and sustainable development to support India's transition towards a technologically advanced, innovative and sustainable economy by 2047.

Objectives of the Study

1. To develop an interdisciplinary framework integrating **mathematics, physics and artificial intelligence** for India's technological development.
2. To examine the role of **mathematical modelling and physics** in digital transformation, AI technologies, renewable energy and communication systems.
3. To explore **AI applications in digital commerce and the digital economy** for efficient decision-making and value creation.
4. To develop **mathematical and AI-based models** supporting energy efficiency and sustainable development.
5. To identify key **opportunities, challenges and a roadmap** for integrating education, research, innovation and industry towards Viksit Bharat @2047.

Proposed Mathematical-Physical Intelligence Framework

The proposed framework views India's technological future as an interconnected system supporting Viksit Bharat @2047. It integrates **Mathematics, Physics and Artificial Intelligence (AI)** as the core technological foundations. Mathematics provides modelling, statistics, probability and optimization for intelligent decision-making. Physics supports energy, semiconductors, sensors, communication and quantum technologies.

AI processes data and enables intelligent applications across different sectors. These technologies strengthen the **Digital Economy**, including FinTech, e-commerce and supply chains, while promoting innovation.

The overall framework connects **M → P → AI → D → S**, leading towards sustainable development and Viksit Bharat @2047.

Role of Mathematics and Physics in India's Digital Future

Mathematics provides the logical foundation for algorithms, artificial intelligence and data-driven decision-making. Mathematical modelling helps India optimize resources, predict trends and solve complex national challenges. Statistics and probability support reliable analysis in healthcare, finance, agriculture and digital services. Optimization techniques improve energy management, transportation, logistics and supply-chain efficiency. Physics provides the scientific foundation for modern digital and technological infrastructure.

Semiconductor physics enables advanced processors, sensors, memory devices and AI hardware.

Physics also drives innovations in renewable energy, quantum computing, optical communication and satellite systems. The integration of mathematics and physics improves the accuracy, efficiency and reliability of emerging technologies. Together, these disciplines strengthen India's capacity for innovation, technological self-reliance and digital growth. Their integration with AI and the digital economy can play a vital role in achieving Viksit Bharat @2047.

Optimization for Sustainable Development

Optimization helps identify the best use of limited resources while achieving economic and environmental goals.

Mathematical optimization can reduce energy consumption, operational costs and material wastage.

It supports efficient planning of renewable-energy generation, transportation and industrial systems.

Optimization models can balance economic growth with carbon reduction and environmental protection.

AI-based optimization further improves real-time resource allocation and sustainable decision-making.

Thus, optimization provides a powerful mathematical approach for building an efficient and sustainable Viksit Bharat @2047.

Renewable Energy, Mathematics and Physics

Physics explains the fundamental principles behind solar, wind, hydro and other renewable-energy technologies.

Mathematics helps model energy production, forecast demand and optimize the use of renewable resources.

Mathematical and physical models can improve the efficiency and reliability of renewable-energy systems.

Their integration supports better energy storage, grid management and reduction of carbon emissions.

Together, mathematics and physics provide a strong foundation for India's clean-energy transition and sustainable development.

Applications in Major Sectors

The proposed framework can support agriculture, healthcare, finance, transportation, energy and digital commerce through intelligent data-driven solutions. AI, mathematics and physics can improve resource management, prediction, automation and operational efficiency across these sectors. Their integrated application can promote innovation, productivity and sustainable growth towards Viksit Bharat @2047.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Conclusion

Viksit Bharat @2047 offers a pathway to combine technological progress, economic growth and sustainability into a unified development vision. The proposed MPI framework integrates mathematics, physics, AI, digital commerce, innovation and sustainable development. Mathematics enables modelling and optimization, while physics provides the scientific and technological foundations for advanced systems. AI transforms data into intelligent decisions, and digital commerce converts technological innovation into economic value. Together, these disciplines can support renewable energy, smart transportation, fraud detection, supply chains and other applications for India's sustainable digital future.

Abstract :

The evolution of digital technologies has fundamentally transformed the role of libraries in society. Libraries that were once physical repositories of printed material are now providing greater access to e-books, e-journals, digital repositories, online databases, and institutional resources. The next frontier in this evolution is the creation of intelligent knowledge hubs, enabled by new technologies such as Artificial Intelligence, machine learning, cloud computing, natural language processing, and multilingual systems. Intelligent libraries have the potential to be critical knowledge infrastructures for education, research, innovation, digital literacy, skill development, and lifelong learning in the context of Viksit Bharat @2047. Digital resources and remote information services can help bridge the knowledge divide between rural and urban communities, while multilingual digital content can enhance information access for a diverse range of users. At the same time, the development of intelligent knowledge hubs also presents a number of challenges, including inadequate digital infrastructure, financial constraints, skills gaps, data privacy, cybersecurity, copyright, and ethical issues around AI. Consequently, technological development needs to be supported by well-trained library professionals, robust security measures, ethical practices, and user-focused policies. By taking an inclusive and sustainable approach, intelligent libraries can play a significant role in advancing a knowledge-driven, digitally empowered, and inclusive Viksit Bharat @2047

Keywords : *Digital Libraries, Intelligent Knowledge Hubs, Artificial Intelligence, Viksit Bharat @2047, Digital Transformation, Knowledge Society, Digital Literacy, Lifelong Learning, Multilingual Services, Smart Libraries.*

Introduction :

Libraries have evolved from time to time with the development of technology and the rise of digitization. The traditional library system based on physical resources has transformed itself into a digital library that stores a vast amount of information in the form of e-books, journals, online resources, research publications, and repositories. The paradigm of Artificial Intelligence, cloud computing, machine learning, and multilingual technologies will lead digital libraries to the next level of transformation, namely intelligent knowledge hubs. Intelligent libraries have the potential to drive education, research, innovation, digital literacy, skill development, and lifelong learning, especially in Viksit Bharat @2047. Intelligent knowledge hubs can bridge the digital divide between urban and rural areas and promote equitable access to trustworthy digital information resources. However, there are some challenges related to digital infrastructure, cybersecurity, data privacy, copyright issues, funding, and human resources that researchers and policymakers should consider while building intelligent knowledge hubs.

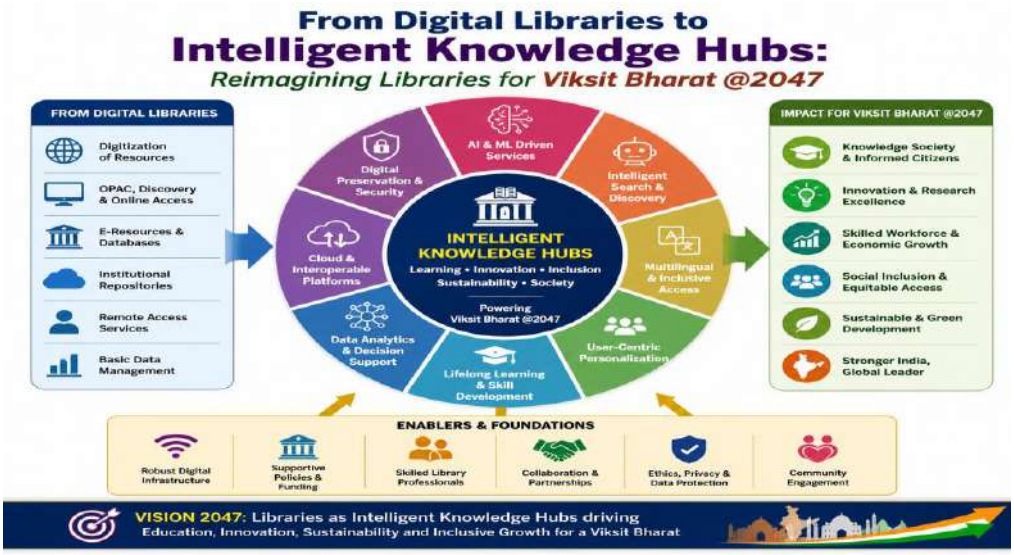
Website: https://bnir.us



2. The key objectives of the research :

1. To study the transformation of traditional libraries into digital and intelligent knowledge hubs.
2. To evaluate the role of digital libraries towards achieving the vision of Viksit Bharat @2047.
3. To study the use of Artificial Intelligence and emerging technologies in library services.
4. To study the contribution of digital libraries to education, research and lifelong learning.
5. To assess the role of digital libraries in reducing the rural-urban knowledge gap.
6. To study the need and importance of multilingual digital knowledge services.
7. To identify the major challenges for developing intelligent knowledge hubs.
8. To suggest inclusive, secure and sustainable strategies for Viksit Bharat @2047 towards developing intelligent libraries.

Research Design and Methods :

The study follows mainly descriptive and conceptual research design based on secondary data. Data were obtained from research articles, books, government reports, policy documents, the IFLA/UNESCO publications, and trustworthy internet resources. Thematic analysis of the collected data was carried out to reveal patterns of digital transformation, AI applications, challenges, and intelligent libraries' role in Viksit Bharat @2047.

Need for the Present Study :

Due to the significant impact of the increased development of digital technologies and Artificial Intelligence (AI) on academic libraries, it is essential to understand how digital libraries can shift towards intelligent knowledge hubs. The article explores this question to identify the role of digital and intelligent libraries in Viksit Bharat @2047, lifelong learning, education, digital literacy, and eliminating the rural-urban digital divide, as well as to highlight challenges and appropriate strategies for all stakeholders.

Critical Review of Existing Research/Study :

The existing studies have demonstrated that digital libraries have facilitated the accessibility of e-books, journals, databases, and other resources. Subsequent studies have revealed the increasing use of Artificial Intelligence, machine learning, cloud computing, and smart search engines in managing and providing access to information. Besides, several researchers have investigated and recommended the role of digital libraries in education, research, digital literacy, and lifelong learning.On the other hand, the existing studies have emphasized the importance of developing and sustaining a virtual repository of digital resources. However, there is still limited information about the role of intelligent knowledge hubs in Viksit Bharat @2047. Further research is required to reveal the issues of the rural-urban digital divide, multilingualism, ethical AI, data privacy, and sustainability. Thus, the current research undertook the responsibility to fill the research gap and demonstrate the role of smart libraries in building a knowledge-based and equitable Bharat by 2047.

Research Analysis :

6.1 Transformation of Libraries into Intelligent Knowledge Hubs Research Paper

The development of information and communication technology has brought to the fore a significant transformation in the operations of libraries. Traditionally, libraries involved themselves in providing printed books, journals, reference materials and services by means of conventional methods. However, with the advent of computers and related technology, libraries digitized and evolved towards online catalogues, electronic resources, digital repositories and remote access to information resources. The

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

aforementioned revolutionized the provision of library resources and services beyond the limitations of time and place. However, the introduction of advanced technologies into the operations of libraries has further altered their orientation and place in the provision of information services. Of late, libraries have been transformed into knowledge hubs through the utilization of artificial intelligence, machine learning algorithms, cloud computing, natural language processing, data analytics among other innovations. The paper argues that the transformation has necessitated the acquisition of digital and technological literacy on the part of library professionals. Overall, the transition from manual to digital and intelligent libraries represent a shift from collection centric to knowledge intensive based services and resources, thereby enhancing their relevance in the modern educational and research needs.

6.2 Digital Libraries for Viksit Bharat @2047

Digital libraries would immensely contribute to Viksit Bharat @2047 goal as they would make trustworthy knowledge and learning sources accessible to a vast audience. Unlike traditional libraries, digital ones could provide the students, researchers, professors, and citizens with easy access to e-books, journals, research papers, databases, and other educational resources. Multiple benefits can come from digital libraries, including excellent educational content, quality knowledge, research, and innovation, the spread of digital literacy and continuous learning, and availability of resources for those who cannot reach large repositories of reading material. The online versions of the physical books and resources would bridge the gap between individuals in need and those with extensive collections of the same. Moreover, virtual repositories will bridge the learning divide by bringing high-quality educational material to rural areas and remote regions. Indian language digital resources will make it easier for people to learn and obtain the same high-quality content. In addition, the digital repositories would safeguard and store treasures of knowledge for future generations of scholars and students. Therefore, with the right tools and professionals, digital libraries can be an essential part of Viksit Bharat @2047 as they will provide the citizens with knowledge, skill, and innovation to make India competitive, smart, and inclusive by 2047.

6.3 AI and Emerging Technologies in the Library Sector

The application of artificial intelligence (AI) and emerging technologies is transforming the contemporary libraries and their ability to serve the information needs of their users. The application of AI can support libraries in enhancing their search capabilities, offering recommendations, managing digital libraries, and responding to frequently asked questions through chatbots. Moreover, the application of machine learning algorithms can support these institutions in identifying patterns and trends. Other technological innovations that can be applied in the library sector consist of cloud computing, optical character recognition, radio-frequency identification, natural language processing, and apps. These solutions can offer better and faster access to information and help the organizations operate continuously while offering remote assistance to their users. However, such solutions would require adequate security measures and considerations about the costs and possible ethical concerns. Thus, the library sector should consider the adoption of technological solutions to enhance their performance while still emphasizing the role of human resources in the field.

6.4 Digital Libraries for Education, Research and Lifelong Learning

Digital libraries provide valuable support to education, research and lifelong learning by offering convenient access to a vast amount of information resources. Students, as well as researchers, can take advantage of such services as e-books, online journals, references, research papers, and databases. Education and research can greatly benefit from having such useful information sources within easy reach. Researchers will have instant access to literature, reports, theses, and journals, which makes the search and retrieval of information more convenient, saving them both time and effort. Moreover, digital libraries promote self-learning and self-education. By offering resources in digital format, they allow a wider audience to access the information, including people with limited financial resources. In addition, digital libraries are helpful in lifelong learning, enabling students to update or expand their knowledge and skills. The use of such services is also beneficial for people living in remote areas, as well as for those who are highly interested in a particular subject but do not have the opportunity to attend educational institutions. Moreover, it will be possible to overcome such barriers to learning as the absence of local libraries and the lack of multilingual education.

6,5 Bridging rural-urban knowledge gap using digital libraries

Digital libraries can help bridge the rural-urban knowledge gap by providing access to information

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

resources that may not be available in local libraries. Rural students, teachers, researchers, and residents can benefit from the information resources through internet services such as e-books, journals, educational materials, research papers, and online databases. Access to such content can create quality learning and skill development opportunities for the inhabitants of rural areas. Additionally, digital libraries can offer online education, competitive exam preparation, employment information, and lifelong learning resources. Moreover, mobile access to the libraries can be a reliable way of accessing the content, especially for people who do not have easy access to computers. The use of local languages and Indian language for the content will also help increase accessibility. However, the effectiveness of digital libraries in bridging the rural-urban knowledge gap depends on the availability of internet services and gadgets and digital literacy in the rural areas. As a result, the enhancement of digital infrastructure and digital literacy in the rural areas is key to achieving knowledge equity.

6.6 Need and Importance of Multilingual Digital Knowledge Services

Multilingual digital knowledge services would be of immense importance in a diverse country like India where different languages are used for various purposes including education, communication, and others. Offering digital resources in Indian and regional languages will enhance accessibility to students, researchers, rural communities, and all other users of library resources. E-books, journals, educational resources, and other materials in various languages can increase the rate of adoption of digital resources by students and other users. The use of technologies such as Artificial Intelligence, machine translation, natural language processing, automatic speech recognition, and text-to-speech technologies can facilitate multilingual searching and retrieval of information. Similarly, multilingual digital resources can help store and preserve local literature, indigenous knowledge, local history, and other information in electronic archives.

Moreover, multilingual facilities can help overcome language barriers and enhance digital inclusion while enabling equitable access to knowledge. Similarly, the provision of multilingual digital knowledge services will support education, research, and community development as well as promote lifelong learning, and build human capital. As such, the need and importance of multilingual digital knowledge services cannot be underestimated by modern libraries and the Viksit Bharat @2047 vision.

6.7 Major Challenges in Developing Intelligent Knowledge Hubs

There are some primary challenges that may occur when developing intelligent knowledge hubs. First, the libraries may experience an inadequacy of resources, including the Internet, hardware, servers, software, and storage. Second, the financial situation of libraries, especially those of a smaller size or in rural locations, might restrict their ability to embrace the required technological solutions. Additionally, libraries may struggle to find the professionals to support and manage such structures as Artificial Intelligence, cybersecurity, data, and cloud storage. The growing relevance of technology in all fields, including libraries, raises cybersecurity, copyright, and data privacy concerns. Finally, implementing AI structures in libraries bears the risks of providing erroneous information and imprecise or biased results. Thus, financial and technical restrictions, the digital divide between those who have access to technology and those who do not, and the lack of digital content in non-English languages are the issues that need addressing when developing intelligent knowledge hubs. The latter is especially relevant to India, where the population speaks a variety of local languages. That is why financial support, the introduction of advanced technologies, training, security, multilingualism, and ethical considerations should be taken into account when developing intelligent libraries.

6.8 Strategies for Inclusive and Sustainable Intelligent Libraries

Strategies for developing inclusive, safe, and sustainable intelligent libraries in Viksit Bharat@2047 context could focus on providing reliable internet access, digital devices, cloud infrastructure, and accessible services in rural and remote areas to promote equitable access to information and technology. Digital literacy programs could be launched to empower users with the necessary skills to navigate and exploit modern library resources and services. Simultaneously, intelligent library systems should prioritize data privacy, cyber security, copyright protection, and ethical AI deployment to guarantee trustworthiness and compliance with legal and regulatory requirements. Additionally, digital content in local languages would facilitate inclusive and barrier-free access to knowledge and information. Other strategies include adopting cost-effective technologies, digitization and archival platforms, regular data back-up measures, professional development for library staff, and partnerships with government agencies, academia,

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

research institutions, and tech companies to advance intelligent library ecosystems.

Research Findings

Based on the study results, it is concluded that digital libraries are rapidly evolving into intelligent knowledge hubs, empowered by AI and emerging technologies, and play a critical role in enabling access to education, research, lifelong learning, and digital resources. The digital library is a great opportunity to bridge the rural-urban knowledge divide and offer multilingual access to knowledge. However, there are still some barriers to fully embracing digital libraries, including insufficient infrastructure, finance, and expertise; cybersecurity, privacy, and data protection; intellectual property; and copyright and legal issues. Overall, the study concludes that intelligent libraries can make a significant contribution to the Viksit Bharat@2047 agenda if India invests in policy design, modern infrastructure, professional competencies, cybersecurity, and responsible AI while ensuring equitable access to knowledge.

7. Suggestions and Recommendations :

1. Enhance digital infrastructure: provision of reliable internet connections, advanced computer hardware, cloud-based platforms, and digital repositories.
2. Promote AI-based search, recommendation, cataloging, and virtual assistant tools.
3. Capacity-building programs on AI, digital literacy, and knowledge management for library professionals and patrons.
4. Develop digital resources and search tools in Indian languages and other regional dialects.
5. Emphasize privacy, cyber security, copyright laws, and ethical AI deployment.
6. Bridging the digital divide by focusing on rural and remote populations by providing access to digital libraries.
7. Sustainable development: open-source technologies, digital preservation strategies, shared repositories, and affordable solutions.
8. Collaborative ecosystems involving governments, academia, libraries, and technology firms to create smart knowledge networks for Viksit Bharat @2047.

Conclusion :

The shift from traditional libraries to digital and intelligent knowledge hubs marks a significant paradigm in library and information science. By leveraging digital technologies, the reach of educational resources, research materials, and lifelong learning has significantly expanded. Artificial Intelligence, cloud computing, machine learning, and multilingual technologies can further aid and complement the quality, speed, and accessibility of library services. In the Viksit Bharat @2047 context, intelligent libraries can catalyze education, research, innovation, digital inclusion, and knowledge development. They can also bridge the rural-urban knowledge gaps to increase access to reliable information. Nevertheless, challenges around infrastructure, funding, skilled manpower, cyber security, privacy, copyright, and others need to be addressed.

Therefore, intelligent libraries must employ a mix of technology-driven approaches, human capital, ethical strategies, and inclusive policies to become sustainable knowledge hubs and contribute to Viksit Bharat @2047.

Acknowledgement

I would like to express my sincere gratitude to all those who have contributed directly or indirectly to the successful completion of this research paper entitled "From Digital Libraries to Intelligent Knowledge Hubs: Reimagining Libraries for Viksit Bharat @2047." The study focuses on the transformation of traditional libraries into digital and intelligent knowledge hubs and their role in education, research, lifelong learning, digital literacy, and bridging the rural–urban knowledge gap.

Abstract

Artificial Intelligence (AI) is transforming education, research, industry and environmental decision-making, while climate change, biodiversity loss, pollution and resource stress demand ecological literacy and responsible innovation. This paper develops a multidisciplinary framework for integrating AI and Environmental Education in higher education under NEP 2020 to strengthen Education for Sustainable Development, green and digital skills, responsible innovation and Viksit Bharat @2047. The study uses a qualitative, conceptual and document-based design based on verified official and authoritative sources. India's composite SDG Index score rose from 57 in 2018 to 71 in 2023–24; Maharashtra's composite score in 2023–24 was 69. India had 1,028.61 million internet subscribers on 31 December 2025, while higher-education enrolment reached 4.50 crore in 2023–24. The proposed AI–EE–SDG–VB 2047 Framework is based on curriculum integration, capacity building, data and innovation, community engagement, and ethics and governance. The paper argues that technological progress must be accompanied by ecological intelligence, social inclusion and accountable human judgement.

Keywords: *Artificial Intelligence; Environmental Education; NEP 2020; Sustainable Development Goals; Higher Education; Green Skills; Responsible AI; Viksit Bharat @2047.*

Introduction

The twenty-first century is shaped by the rapid expansion of Artificial Intelligence and intensifying environmental challenges. AI can assist with analysing complex datasets, modelling systems, monitoring environmental change and supporting decision-making. Environmental applications include remote sensing, climate modelling, biodiversity monitoring, energy optimisation, precision agriculture and pollution analysis. Yet technological capability does not automatically create sustainable outcomes AI systems require energy, infrastructure, data and governance and may create risks involving bias, privacy, misinformation and unequal access. Education is the bridge between technological capability and responsible social transformation. Education for Sustainable Development seeks to develop the knowledge, skills, values and attitudes required for informed decisions and responsible action. NEP 2020 supports holistic and multidisciplinary education and identifies emerging areas such as AI, big data analysis and machine learning, including applications related to environment and sustainable living.

Shintre, M. R., Shete, D. M., & Irkar, M. D. (2026). Integrating Artificial Intelligence and Environmental Education under NEP 2020: A Multidisciplinary Framework for Sustainable Development and Viksit Bharat @2047. Bulletin of Nexus, 3(9(I)), 68–72.
https://doi.org/10.5281/zenodo.22719732

Therefore, AI literacy and environmental literacy should be integrated so that learners can understand complex problems and develop solutions that are technologically capable, socially useful and ecologically responsible.

Objectives of the Study

1. To examine the relationship between AI, Environmental Education and sustainable development.
   2. To analyse the relevance of NEP 2020 for multidisciplinary integration.
2. 3. To identify opportunities through which AI can strengthen environmental learning and research.
   4. To examine ethical, institutional and environmental risks.
3. 5. To analyse verified national statistical indicators.
4. 6. To propose a framework aligned with the SDGs and Viksit Bharat @2047.

Methodology

This study uses a qualitative, conceptual and document-based research design. It draws on NEP 2020, the SDG India Index 2023–24, AISHE releases, TRAI quarterly indicators, NITI Aayog's AI for Viksit Bharat report and UNESCO guidance on Education for Sustainable Development and AI in education. Statistical indicators are used descriptively to establish context and are not used to claim causal relationships. Policy principles, opportunities, risks and institutional requirements were synthesised to develop the AI–EE–SDG–VB 2047 Framework.

Verified Statistical and Policy Context

India's composite SDG Index score increased from 57 in the 2018 baseline to 71 in 2023–24. NITI Aayog cautions that results across editions are not strictly comparable because indicators and methodology may be revised. Maharashtra's composite score in the SDG India Index 2023–24 was 69. TRAI reported 1,028.61 million internet subscribers as of 31 December 2025, including 1,007.35 million broadband subscribers. Official AISHE releases in July 2026 reported 60,380 registered HEIs in 2022–23 and 64,756 in 2023–24. Higher-education enrolment increased from 3.42 crore in 2014–15 to 4.46 crore in 2022–23 and 4.50 crore in 2023–24. NITI Aayog's 2025 report describes the IndiaAI Mission as a foundational initiative with an estimated budget of over ₹10,000 crore for five years. As of 15 September 2025, the report stated that the mission planned deployment of more than 38,000 GPUs through a federated compute network.

AI as an Enabler of Environmental Education

AI can support data-rich and inquiry-based learning through environmental datasets on weather, biodiversity, water quality, land use and waste. Simulations can help explain climate systems and ecological interactions. Citizen-science projects can support biodiversity documentation and local environmental mapping. Campuses can also use data analytics for energy, water and waste management, becoming living laboratories for sustainability. However, AI-generated outputs must be verified and should support—not replace—critical thinking and professional judgement.

NEP 2020 and the Multidisciplinary Imperative

Environmental problems have scientific, economic, technological, social and ethical dimensions. A multidisciplinary curriculum can connect Environmental Science with Computer Science, Economics, Commerce, Geography, Sociology, Education and Public Policy. Environmental Science students can learn data literacy; Commerce students can examine ESG and sustainable business; Economics students can analyse environmental externalities; and Computer Science students can study responsible and efficient AI.

AI–EE–SDG–VB 2047 Framework

The proposed framework connects AI (digital literacy, data competence and responsible innovation), Environmental Education (ecological literacy and sustainable lifestyles), the SDGs (global benchmarks for sustainable development) and Viksit Bharat @2047 (India's long-term development vision). Five pillars support the framework: 1. Curriculum Integration; 2. Capacity Building; 3. Data and Innovation; 4. Community Engagement; 5. Ethics and Governance. AI Capability + Environmental Literacy → Green and Digital Skills → Responsible Innovation → SDG-oriented Action → Sustainable and Inclusive Development → Viksit Bharat @2047.

Sustainable Development, Green Skills and Employability

The framework directly supports SDG 4 and can contribute to SDGs 8, 9, 12, 13, 15 and 17. The green and digital transitions increasingly overlap. Relevant capabilities include environmental data interpretation, sustainability reporting, climate-risk awareness, circular-economy thinking, responsible AI use, communication and project management. Higher education should connect these capabilities with lifelong learning, entrepreneurship, civic responsibility and ethical decision-making.

Ethical and Environmental Challenges of AI

AI-generated information may contain factual errors or fabricated references, making source

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

verification essential. Bias can reinforce inequalities. Educational uses of AI create concerns regarding privacy, consent, data ownership and unequal access. UNESCO advocates a human-centred approach that protects human agency, inclusion, equity and meaningful learning. Computing also consumes energy and material resources; therefore responsible AI requires efficiency and lifecycle awareness. AI systems must not replace professional judgement, democratic accountability or human responsibility.

Policy Recommendations

1. Establish interdisciplinary AI and Sustainability Cells.
2. 2. Introduce credit-based modules on AI literacy, Environmental Education and digital ethics.
3. 3. Develop campus living laboratories for energy, water, biodiversity and waste.
4. 4. Promote project-based learning using verified local and official datasets.
5. 5. Train teachers in responsible AI use and source verification.
6. 6. Adopt institutional policies covering privacy, disclosure, assessment and human oversight.
7. 7. Encourage student innovation challenges on local sustainability problems.
8. 8. Strengthen partnerships among academia, government, industry and communities.
9. 9. Develop green and digital skill certification pathways.
10. 10. Monitor educational, ethical, social and environmental outcomes.

Roadmap towards Viksit Bharat @2047

2026–2030: Foundation—build AI and environmental literacy, train faculty and establish institutional policies. 2030–2040: Expansion—develop interdisciplinary centres, regional data networks and community laboratories. 2040–2047: Transformation—position higher education institutions as innovation ecosystems generating solutions for ecological resilience and inclusive prosperity.

Key Findings of the Study

The study identifies five key findings. First, Artificial Intelligence can substantially strengthen environmental learning, research and problem-solving when its outputs are supported by reliable data, critical inquiry and human oversight. Second, NEP 2020 provides a strong multidisciplinary foundation for connecting emerging technologies, environmental literacy and sustainable development. Third, India's expanding digital connectivity and higher-education ecosystem create favourable conditions for wider capacity-building in green and digital skills. Fourth, academic integrity, privacy, equity, algorithmic bias and the environmental footprint of computing must be treated as core dimensions of responsible AI. Fifth, the proposed AI–EE–SDG–VB 2047 Framework provides a practical institutional pathway for transforming technological capability into sustainability-oriented education and action.

Conclusion

Artificial Intelligence and Environmental Education are among the most consequential domains shaping the future of higher education. AI can strengthen environmental learning, research, monitoring and innovation, while Environmental Education provides the ecological and ethical perspective required to guide technology towards public good. NEP 2020 provides a foundation for multidisciplinary integration, the SDGs provide a global action framework and Viksit Bharat @2047 provides a long-term national horizon. A truly developed India will require digital intelligence accompanied by ecological intelligence, innovation accompanied by ethics and economic progress accompanied by sustainability.

Abstract

India's vision of Viksit Bharat @2047 rests significantly on harnessing Artificial Intelligence (AI) to power an inclusive digital economy, with the gig and platform sector projected to grow from 7.7 million workers in 2020-21 to 23.5 million by 2029-30 [1]. Within this expanding workforce lies an under-documented segment: college students who work as ride-hailing drivers and delivery partners for platforms such as Uber, Ola, Rapido, Swiggy, and Zomato alongside their academic commitments. While the Code on Social Security, 2020, operationalised through Rules notified in 2025-26, extends formal welfare recognition to gig and platform workers for the first time, it remains largely silent on the algorithmic mechanisms, dynamic pricing, rating-based deactivation, and automated task allocation, that govern their day-to-day work experience, a gap well documented in the international algorithmic-management literature [2], [3], [4]. This paper examines the intersection of AI-driven algorithmic management and worker welfare policy through a mixed-methods approach: a review of the current regulatory framework combined with primary survey data (n = 18) collected from college students in Coimbatore district engaged in gig work. The findings show that a majority of respondents report unpredictable pricing (70.6%) and roughly two in five report unfair ratings (41.2%) or deactivation/suspension (35.3%), while awareness of the e-Shram portal (52.9%) and of statutory welfare benefits (58.8%, with a further 23.5% only vaguely aware) remains partial. The paper concludes with a policy framework recommending algorithmic transparency mandates, accessible grievance redressal mechanisms, and targeted awareness measures for student and youth gig workers, contributing to the broader goal of inclusive, technology-driven, and socially secure economic growth envisioned under Viksit Bharat @2047.

Keywords: *Gig Economy, Algorithmic Management, Artificial Intelligence, Student Gig Workers, Social Security, Viksit Bharat 2047, Platform Regulation*

Introduction

The gig and platform economy have emerged as one of the fastest-growing segments of India's labour market, driven substantially by Artificial Intelligence (AI) systems that match workers to tasks, set dynamic prices, and monitor performance in real time. National projections indicate that India's gig and platform workforce will grow from 7.7 million workers in 2020-21 to an estimated 23.5 million by 2029-30 [1], positioning this sector as a significant contributor to the Viksit Bharat @2047 vision of an inclusive, digitally-driven economy.

Quick Response Code:

Website: https://bnir.us

Within this workforce, a segment that remains largely undocumented in official statistics and academic literature is college students who work as ride-hailing drivers or delivery partners, typically for platforms such as Uber, Ola, Rapido, Swiggy, and Zomato, alongside their academic commitments. Unlike full-time gig workers, this group balances algorithmic work schedules with lecture timetables, examinations, and academic performance pressures, while remaining subject to the same rating systems, deactivation risks, and pricing algorithms as any other platform worker. The regulatory landscape governing gig work has shifted meaningfully in the recent past. The Code on Social Security, 2020, which for the first time formally recognises gig and platform workers as a distinct category eligible for social security benefits, became operationally effective on 21 November 2025, with detailed Social Security (Central) Rules notified in May 2026. This makes the present moment a particularly relevant one for research: the Code is no longer a prospective legislative proposal but an active regulatory framework whose real-world implementation, and its gaps, can now be examined directly. This paper asks two connected questions. First, to what extent does the newly operational Code on Social Security address the algorithmic mechanisms, rather than merely the registration and funding structures, that govern gig workers' daily experience? Second, how do college students specifically experience algorithmic management and awareness of these welfare provisions, given that this sub-group is structurally invisible in both platform data and national labour statistics? To address these questions, the paper combines a policy analysis of the current regulatory framework with primary survey data collected from student gig workers in Coimbatore district, Tamil Nadu.

2. Literature and Policy Review

1 The Regulatory Landscape

The Code on Social Security, 2020 consolidates nine earlier labour laws and, for the first time in Indian labour law, creates a statutory category for "gig workers" and "platform workers," separate from both organised and traditionally defined unorganised sector workers [5], [6]. Its provisions include mandatory registration of workers on the e-Shram portal, an aggregator-funded social security contribution (structured as 1-2% of aggregator turnover, capped at 5% of amounts paid to workers), and eligibility thresholds based on the number of days worked within a scheme period. Implementation has moved from legislative text to active administration only recently. The Code's gig-worker provisions came into force on 21 November 2025, and the Ministry of Labour and Employment notified the Social Security (Central) Rules, 2026 in May 2026, detailing registration mechanics, contribution collection, and benefit disbursal [7]. As of the most recent Ministry data, twelve major aggregators, including Zomato, Swiggy, Uber, Ola, Rapido, Amazon, Blinkit, Zepto, and Urban Company, have been onboarded onto the e-Shram aggregator module [8], [9]. State-level initiatives add a further layer. Karnataka's Platform-Based Gig Workers ordinance and Telangana's draft gig-worker legislation both go further than the central Code in specific respects, including provisions that touch on algorithmic transparency and fair-pricing disclosure, offering a useful point of comparison for evaluating what a more algorithm-aware regulatory framework could look like at the national level [10].

2 Theoretical Foundations: Algorithmic Management as a Distinct Axis of Control

The concept of algorithmic management, the use of software algorithms to perform functions conventionally carried out by human managers such as work allocation, monitoring, evaluation, and discipline, originates in the foundational study of Uber drivers by Rosenblat and Stark [2], who showed that information and power asymmetries embedded in the driver-facing app allow the platform to exercise substantial indirect control over how, when, and for how long drivers work, despite the formal classification of drivers as independent contractors. Building on this, Wood et al. [3], drawing on a cross-regional survey of 679 platform workers across six countries, demonstrated that algorithmic control routinely produces high work intensity and low autonomy even where platforms formally promise flexibility, a tension the authors term the "autonomy paradox" of gig work. Kellogg, Valentine, and Christin [11] synthesise this literature into six mechanisms of algorithmic control, restricting, recommending, recording, rating, replacing, and rewarding, arguing that these mechanisms together constitute a qualitatively new and "contested terrain" of workplace control that is more opaque and harder to contest than conventional supervisory control. Empirical work on food-delivery platforms by Griesbach, Reich, Elliott-Negri, and Milkman [12] further shows that the degree of algorithmic constraint varies systematically across platforms, with rating-linked task allocation and automated deactivation among the most consequential mechanisms for worker income security. The International Labour Organization's synthesis of this literature [13], [4] situates these mechanisms within a broader concern about "decent work" in the platform economy, noting that algorithmically

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

triggered deactivation frequently occurs without prior notice or a clear channel for appeal, leaving workers unable to determine why they lost access to work. A consistent theme across this literature is that algorithmic control operates as an axis of worker vulnerability that is analytically and practically distinct from the question of employment classification or social-security coverage; a worker may be formally registered for welfare benefits and still have no visibility into, or recourse against, the algorithm that determines their daily earnings.

3 Algorithmic Management in the Indian Gig Economy

A growing body of India-focused research extends this literature to the specific socio-economic context of Indian ride-hailing and delivery platforms. Studies of Uber and Ola drivers document how algorithmic matching and dynamic pricing interact with pre-existing informal-sector labour practices, requiring drivers to acquire new digital and navigational skills while absorbing fuel, vehicle, and data costs that are not reflected in platform-side earnings estimates [14]. Comparative work on the Indian ride-hailing ecosystem finds that algorithmic practices materially shape driver autonomy, income stability, and working conditions, and that these effects are shaped by India's distinct socio-political and economic context rather than transferring uniformly from Western-platform studies [15]. Research on platform-driver migration and precarity further shows that gig work in Indian cities is embedded in "digitally organised informality," in which algorithmic control coexists with, rather than replaces, older forms of informal-economy vulnerability [16]. Despite this expanding literature, college students who combine gig work with full-time academic study remain almost entirely absent as a distinct unit of analysis in both the Indian and international literature. Existing Indian studies typically sample full-time or primary-income drivers and delivery partners; none of the sources reviewed for this paper disaggregate findings for a student sub-population balancing algorithmically governed work with fixed academic obligations such as lecture attendance, internal assessments, and examinations. This is the specific empirical gap the present paper's primary survey seeks to address.

4 The Algorithmic Governance Gap and Research Gap

Read together, Sections 2.1-2.3 point to a specific structural mismatch. The Code on Social Security, 2020 and its 2026 Rules establish, for the first time, a funding and registration architecture for gig-worker welfare in India. The international and Indian literature on algorithmic management [2], [3], [11], [4], [15], however, identifies a separate and largely unregulated axis of vulnerability: opaque task allocation, unpredictable dynamic pricing, and deactivation without adequate notice or appeal. Neither the Code nor its Rules impose obligations on aggregators regarding algorithmic transparency, rating-system fairness, or due process before deactivation.

This is the specific gap this paper investigates empirically: whether the Code on Social Security's welfare provisions, now operational, are matched by any corresponding mechanism addressing algorithmic transparency, rating fairness, or deactivation due process, and how this gap is experienced by a specific, under-studied population, namely, college students undertaking gig work part-time in Coimbatore district.

3. Objectives of the Study

- To examine the current regulatory framework governing gig and platform workers in India, with particular attention to what it does and does not address regarding algorithmic management.
- To document the work patterns, income dependency, and platform choices of college students engaged in gig work in Coimbatore district.
- To assess students' experiences of algorithmic management, including perceived fairness of ratings, transparency of pricing, and experience of deactivation or penalty.
- To assess awareness levels among student gig workers regarding social security protections available to them under the Code on Social Security, 2020.
- To propose a policy framework addressing the identified gaps between welfare entitlement and algorithmic governance.

Methodology

This study adopts a mixed-methods design combining documentary/policy analysis with primary survey research. The policy analysis draws on the text of the Code on Social Security, 2020, the Social Security (Central) Rules, 2026, official Ministry of Labour and Employment communications, e-Shram aggregator module data, and comparative state-level legislation (Karnataka, Telangana), to establish the current regulatory baseline (reported in Section 2), and is triangulated with the peer-reviewed and ILO literature on algorithmic management reviewed above. Primary data were collected through a structured online survey administered via Google Forms to college students in Coimbatore district engaged in ride-hailing or delivery gig work alongside their studies.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

The finalised survey instrument, reproduced in full in Annexure A, is organised into five sections: screening and consent, demographic profile, gig work profile, algorithmic management experience, and awareness of social security and welfare provisions, together with two optional open-ended questions. The version of the instrument actually deployed in the field used a condensed set of items with lightly re-worded question text and response options (for example, age was collected in five-year bands rather than as a numeric value, and platform-affiliation options were reduced); the substantive content and construct coverage of the deployed instrument is materially consistent with Annexure A. The survey yielded 18 responses (n = 18), collected on 29 August 2026. This falls short of the 40-60 valid-response target set out in the original study design; the smaller achieved sample is treated as a limitation throughout, and the findings below are reported as exploratory and indicative of a hard-to-reach population rather than statistically representative. One response (5.6% of the sample) was abandoned after the demographic section and is excluded from all analyses beyond basic demographic counts, leaving an effective analytic base of n = 17 for most substantive items. A further data-quality issue is noted for transparency. The deployed screening item asked respondents "Are you currently working as a gig/platform worker?"; 13 of 18 respondents (72%) answered "No" to this item, yet went on to complete the detailed platform, hours, income, and algorithmic-management questions that follow it in the form, indicating either intermittent/former rather than continuous current engagement, ambiguity in how respondents interpreted the term "currently," or a form-logic issue that did not route non-gig-workers to the end of the survey as originally specified. Because the substantive responses these participants gave are internally consistent (specific platforms, income bands, and concrete descriptions of rating, deactivation, and pricing experiences), they have been retained in the analytic sample rather than discarded, but this should be read as an important caveat on the precision of the "active gig worker" label applied to the sample as a whole, and is revisited in the Discussion and Limitations (Section 6.1). The age distribution of respondents also includes a small number of participants outside the typical undergraduate age range (four of 18 respondents were 25 years or older); the remaining 14 (78%) fall in the 18-24 band consistent with the study's target population. Twelve of the 18 usernames captured were institutional (@hicet.ac.in) email addresses, supporting the presence of a genuine student sub-sample within the data. Given these constraints, the survey findings reported in Section 5 are best understood as an exploratory first look at a genuinely hard-to-reach and under-documented population, rather than as a definitive estimate of prevalence.

Findings

This section reports descriptive results from the 18 survey responses (17 substantively complete). Percentages are calculated on the valid (non-missing) responses to each item and are reported to one decimal place given the small base; readers should treat point estimates as indicative rather than precise.

1 Sample Profile and Work Patterns

Of the 18 respondents, 9 (50%) identified as male and 9 (50%) as female. Fourteen respondents (77.8%) were aged 18-24, consistent with the target undergraduate population, while four respondents fell in older age bands (25-34, 35-44, and 45+), a composition noted as a limitation in Section 4. On engagement type, 5 of 17 valid responses (29.4%) specifically identified as cab/auto-driving gig workers, with the remainder split across food delivery, grocery/parcel delivery, and an "Other" category that a majority of respondents (11 of 18) selected for both gig type and platform, a pattern that limits the granularity of platform-specific conclusions that can be drawn from this sample. Among respondents who did name a platform, Rapido was the most frequently cited (5 respondents), followed by Ola, Uber, and Swiggy (1 each).

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

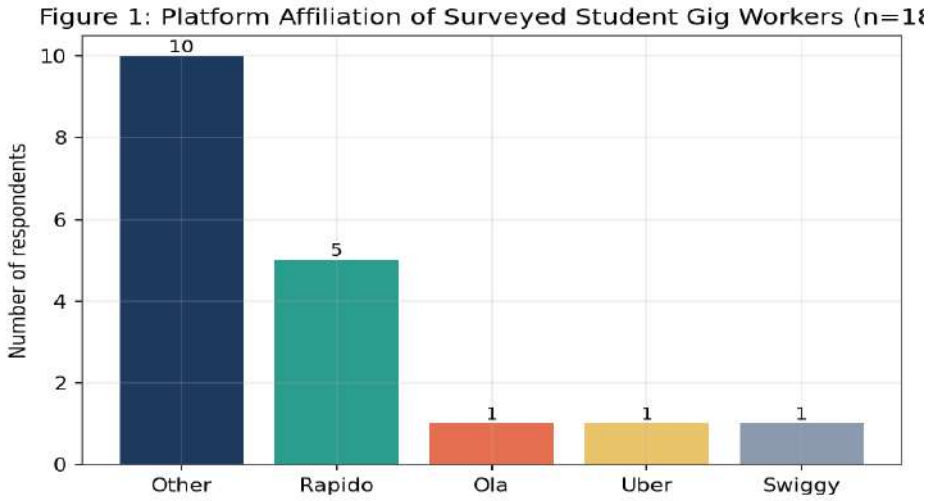

Figure 1: Platform affiliation of surveyed student gig workers (n = 18; "Other" reflects the platform-affiliation option most frequently selected in the deployed instrument).

On work intensity, the majority of respondents (12 of 17, 70.6%) reported working below 20 hours per week alongside their studies, consistent with gig work functioning as a secondary rather than primary time commitment for most of the sample; a smaller group (3 of 17, 17.6%) reported more than 40 hours per week, suggesting a minority for whom gig work approaches full-time intensity even while enrolled in college.

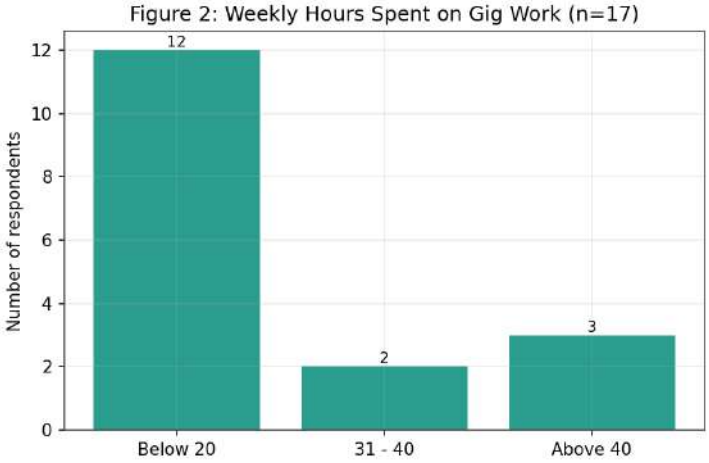

Figure 2: Self-reported weekly hours spent on gig work (n = 17).

Monthly income from gig work was concentrated at the lower end of the scale: 9 of 17 respondents (52.9%) reported earning below ₹10,000 per month, and a further 4 (23.5%) reported ₹10,000-₹20,000, together accounting for over three-quarters of the sample. Only 2 respondents (11.8%) reported earnings above ₹30,000. Duration of engagement was similarly concentrated among relatively new entrants: 12 of 17 respondents (70.6%) had been doing gig work for less than one year.

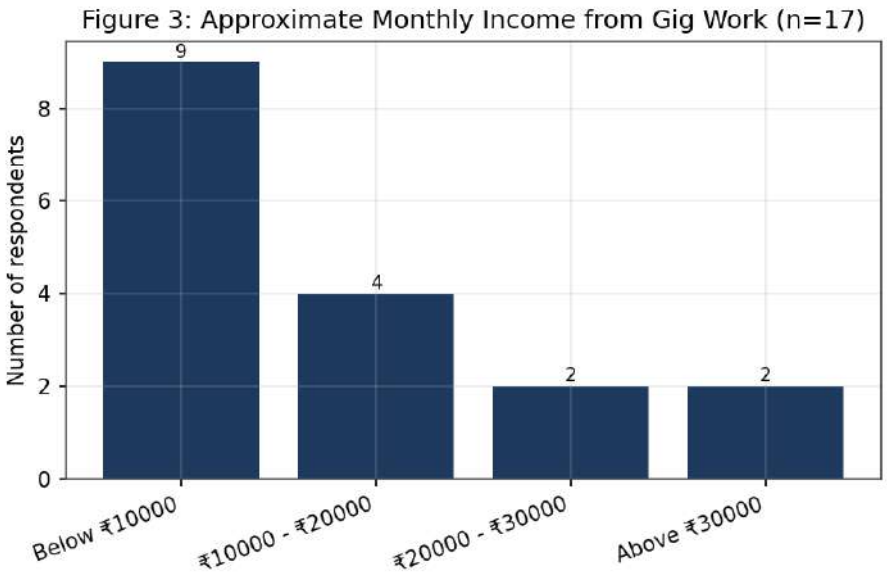

Figure 3: Approximate monthly income from gig work (n = 17).

Table 1: Summary Sample Profile

Table 1: Summary sample profile of surveyed student gig workers.

Indicator	**Category**	**n / N (valid)**	**%**
Gender	Male	9 / 18	50.0
Gender	Female	9 / 18	50.0
Age group	18 - 24	14 / 18	77.8
Age group	25 and above	4 / 18	22.2
Weekly hours	Below 20 hrs	12 / 17	70.6
Weekly hours	31 - 40 hrs	2 / 17	11.8
Weekly hours	Above 40 hrs	3 / 17	17.6
Monthly income	Below ₹10,000	9 / 17	52.9
Monthly income	₹10,000 - ₹20,000	4 / 17	23.5
Monthly income	₹20,000 - ₹30,000	2 / 17	11.8
Monthly income	Above ₹30,000	2 / 17	11.8
Duration of gig work	Less than 1 year	12 / 17	70.6
Duration of gig work	1 year or more	5 / 17	29.4

2 Algorithmic Management Experience

Findings on algorithmic management experience speak directly to the paper's central argument. Pricing unpredictability was the most widely reported concern: 12 of 17 respondents (70.6%) reported that platform pricing or incentive structures felt unpredictable either "often" or "sometimes," with only 5 (29.4%) reporting that pricing felt predictable. Unfair ratings were reported by 7 of 17 respondents (41.2%), with a further 4 (23.5%) "not sure" whether ratings they received were fair, indicating that even where students do not report an unambiguously unfair rating, a substantial share are uncertain about how the rating mechanism evaluates them, itself a

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

marker of low algorithmic transparency. Six of 17 respondents (35.3%) reported having experienced platform deactivation or suspension at least once.

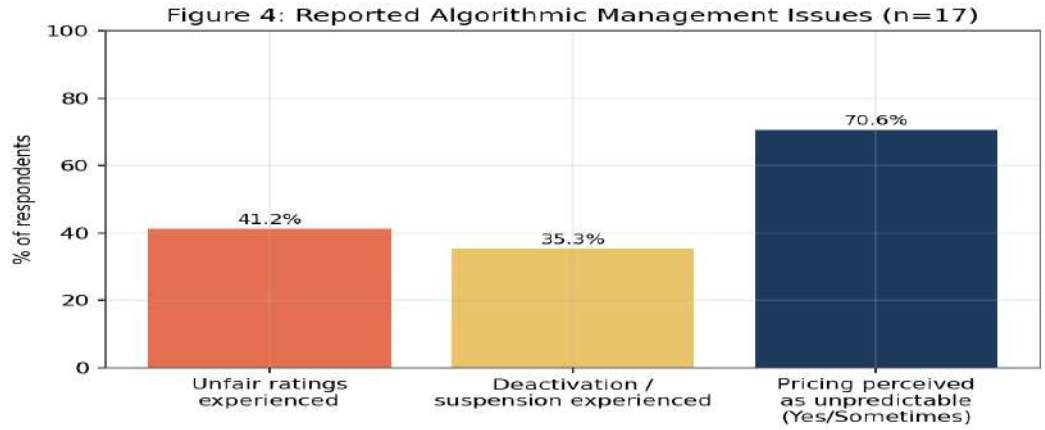

Figure 4: Reported algorithmic management issues among surveyed student gig workers (n = 17).

Table 2: Summary of algorithmic management experience among surveyed student gig workers.

Indicator	% Reporting Issue / Response	n (valid)
Reported unfair rating at least once (Yes)	41.2%	17
Uncertain whether rating was fair (Not sure)	23.5%	17
Experienced deactivation or suspension (Yes)	35.3%	17
Pricing/incentives reported unpredictable (Yes + Sometimes)	70.6%	17
Pricing/incentives reported predictable (No)	29.4%	17

3. Awareness of Social Security Provisions

Awareness of the formal welfare architecture described in Section 2.1 was moderate but incomplete. Nine of 17 respondents (52.9%) reported having heard of the e-Shram portal, while 8 (47.1%) had not. Awareness of statutory welfare or social-security benefits available to gig workers (insurance, health cover, accident cover) was somewhat higher: 10 of 17 respondents (58.8%) reported general awareness, though the survey instrument in this deployed form did not distinguish between full awareness of scheme details and vague familiarity with the concept, a distinction the finalised instrument in Annexure A is designed to capture more precisely in future rounds.

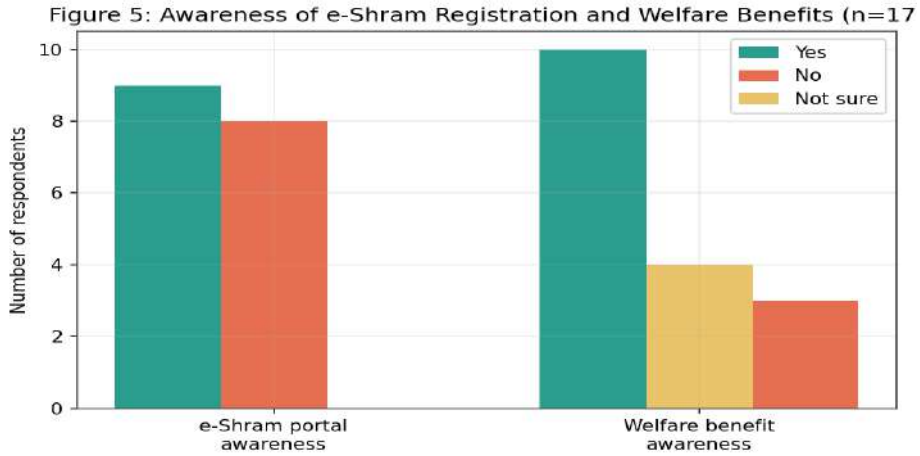

Figure 5: Awareness of the e-Shram portal and of statutory welfare benefits (n = 17).

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Table 3: Awareness of social security and welfare provisions among surveyed student gig workers.

Indicator	**% Aware**	**% Not aware / Not sure**
Aware of e-Shram portal	52.9%	47.1%
Aware of gig-worker welfare/social-security benefits	58.8%	41.2%

4. Reported Problems and Illustrative Qualitative Responses

When asked to identify the single biggest problem faced in gig work, respondents most frequently cited low or unstable income and unfair ratings (4 mentions each, 25% of 16 valid responses each), followed by long working hours and fuel/vehicle expenses (3 mentions each, 18.8%), with deactivation and lack of social security each cited once.

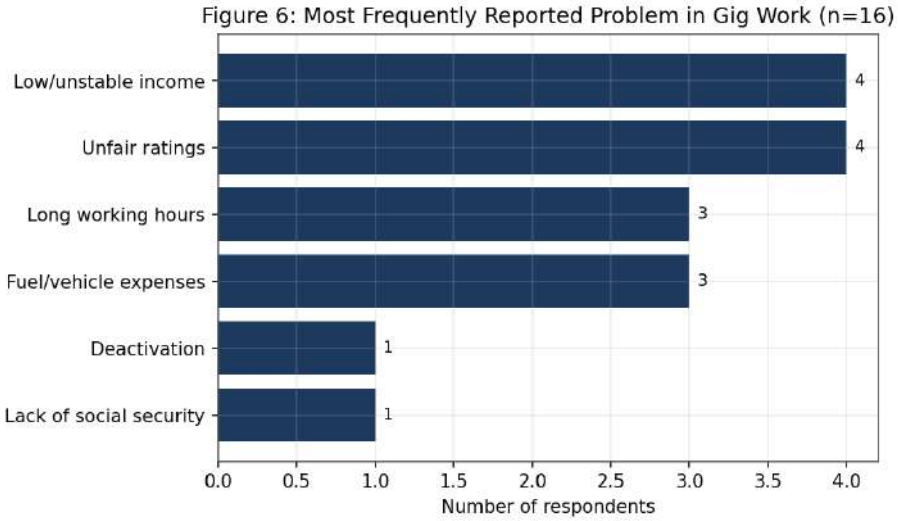

Figure 6: Most frequently reported problem in gig work, self-reported (n = 16).

The optional open-ended item asking what change respondents would want platforms or government to make elicited a small number of substantive, illustrative responses, paraphrased here to preserve anonymity. Several respondents called for a guaranteed minimum pay floor and coverage of work-related expenses; one specifically suggested that accident and health insurance costs be partly shared by the platform. Two respondents independently raised the idea of "portable" benefits that would follow a worker across platforms rather than resetting with each new app. One respondent explicitly linked the transparency and welfare themes of this paper, calling for clear disclosure of how earnings and ratings are algorithmically calculated. Several other respondents offered no specific suggestion, and a few gave only minimal responses (e.g., "nothing," "nil"), which itself may be read as a mild indicator of low expectation of policy responsiveness, though this interpretation should be treated cautiously given the small base.

Discussion

The survey findings lend empirical support to the structural concern raised by the policy analysis in Section 2. The Code on Social Security, 2020 and its 2026 Rules establish a funding and registration architecture for gig-worker welfare, but neither instrument imposes obligations on aggregators regarding algorithmic transparency, rating-system fairness, or due process before deactivation. Consistent with this, 70.6% of surveyed students reported unpredictable pricing and roughly two in five reported unfair ratings or deactivation, while awareness of the welfare provisions that do exist remains partial (52.9%-58.8%). This pattern is consistent with the international literature's central claim, that algorithmic control functions as an axis of vulnerability distinct from formal social-security coverage [2], [3], [11], [4], and extends that claim to a specific, previously undocumented Indian sub-population. For the specific population under study, college students, this gap may carry distinct implications. Unlike full-time gig workers, students combine algorithmically governed work schedules with fixed academic obligations; an opaque or unpredictable allocation and pricing system may therefore interact directly with academic performance and attendance in ways that a purely income-focused welfare framework does not capture or address. The concentration of respondents in the below-20-hours and below-

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

₹10,000-per-month bands (Section 5.1) is consistent with gig work functioning as a supplementary rather than primary income source for most students in this sample, which in turn means that algorithmic unpredictability, however modest its absolute financial stakes, is being absorbed alongside, not instead of, full-time academic obligations.

1 Limitations

Three limitations should be weighed when interpreting these findings. First, the achieved sample (n = 18, effectively n = 17) is well below the 40-60 target set in the study design and below what would be needed for statistical generalisation; findings should be read as exploratory and hypothesis-generating rather than representative of the wider population of student gig workers in Coimbatore district or India more broadly. Second, as discussed in Section 4, a majority of respondents answered "No" to a current-employment screening item while completing detailed gig-work items, introducing ambiguity about the precision of "active gig worker" status within the sample; this may reflect intermittent engagement, a comprehension issue with the deployed question wording, or a survey-routing error rather than reflecting on the underlying phenomenon being studied. Third, a majority of respondents selected "Other" for both gig type and platform, limiting the paper's ability to draw platform-specific conclusions (for example, comparing Uber, Ola, Swiggy, and Zomato users directly) with confidence. Future rounds of this research should prioritise a larger achieved sample, tightened screening logic with automatic form routing, and closed platform categories with a residual "Other, please specify" option to preserve analytic granularity.

7. Policy Framework and Recommendations

1 Algorithmic Transparency Measures

- Mandate aggregator disclosure of the general logic governing task allocation and dynamic pricing, in plain-language form accessible to workers, without requiring disclosure of proprietary algorithmic code. This directly addresses the 70.6% of surveyed students who reported pricing as unpredictable.
- Require a minimum notice-and-reason standard before any rating-based or performance-based deactivation, drawing on comparable provisions already present in state-level legislation such as Karnataka's ordinance, informed by the 35.3% of respondents who reported having experienced deactivation or suspension.

2 Grievance Redressal

- Establish an accessible, low-cost grievance redressal mechanism for disputed deactivations or rating penalties, distinct from and in addition to the welfare-benefit grievance mechanisms already contemplated under the Code on Social Security, informed by the 23.5% of respondents who reported being unsure whether a rating received was fair rather than confidently disputing it.

3 Targeted Awareness for Student and Youth Gig Workers

- Introduce targeted e-Shram and social-security awareness campaigns through college placement cells and student services; the survey found that 47.1% of student gig workers had not heard of the e-Shram portal, and this population is unlikely to be reached through conventional labour-department outreach channels.
- Explore simplified, part-time-appropriate registration and contribution pathways recognising that student gig work is often intermittent rather than continuous, a pattern reflected in the screening-response ambiguity documented in Section 4.

4 Monitoring and Data

- Recommend that future rounds of national data collection (e-Shram, PLFS, or dedicated gig-economy surveys) include an explicit "student/dual-status" flag, allowing this population to be identified and monitored, since no current government data source captures this sub-group, and since this paper's own primary data collection illustrates how easily such respondents can be missed or misclassified by standard screening questions.

Conclusion

This paper has examined the intersection of AI-driven algorithmic management and worker welfare policy in India's gig economy, with particular attention to a currently undocumented population: college students undertaking ride-hailing and delivery work alongside their studies. Drawing on the newly operational Code on Social Security, 2020 and its 2026 Rules, and on the international literature on algorithmic management [2], [3], [11], [4], the paper has argued that current regulation addresses income-security welfare comprehensively but leaves algorithmic governance, ratings, pricing transparency, and deactivation due process, largely unaddressed. Primary survey data from 18 student gig workers in Coimbatore district support this argument directly: 70.6% reported unpredictable pricing, 41.2% reported unfair ratings, and 35.3% reported

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

deactivation or suspension, while awareness of existing welfare provisions remained partial (52.9%-58.8%). Given the modest achieved sample and the data-quality caveats discussed in Sections 4 and 6.1, these findings are best read as an exploratory but concrete first empirical foothold on a genuinely hard-to-reach population, one that future, larger-scale research should build upon. The policy recommendations offered, spanning algorithmic transparency, grievance redressal, targeted awareness, and improved data monitoring, are intended as a practical contribution toward ensuring that India's AI-driven gig economy grows in a manner consistent with the inclusive and socially secure vision of Viksit Bharat @2047.

Acknowledgement

The authors would like to express their sincere gratitude to all those who contributed to the successful completion of this research study. We are especially thankful to the college students in Coimbatore district who participated in the survey and shared their valuable experiences and perspectives regarding gig work, algorithmic management, and social security provisions. We gratefully acknowledge the support and guidance received from the Department of Computer Applications, Hindusthan College of Engineering and Technology, Coimbatore District, Tamil Nadu, India. We also acknowledge the valuable contribution of the Ministry of Labour and Employment, Government of India, and the e-Shram portal, whose regulatory information and official data provided an important foundation for this study.

Financial support and Sponsorship

Abstract

The national discourse surrounding Vikasit Bharat@2047 envisions India's centenary of independence through economic self-reliance, technological transcendence, sustainability, and socio-cultural rejuvenation. While socioeconomic frameworks dominate state policy, the literature serves as an essential barometer of civilizational ethos and human experience. This study investigates how Indian literature—both in English and translated regional vernaculars—imagines, interrogates, and constructs pathways toward a developed India by 2047. Drawing on postcolonial theory, speculative realism, ecocriticism, and subaltern studies, this study analyzes how contemporary and visionary literary works negotiate the tensions between hyper-modernity and ancient philosophical inheritances (Sanatana ethics, Vasudhaiva Kutumbakam). It interrogates the themes of technological ethics, ecological stewardship, gender democratization and subaltern emancipation. Ultimately, this paper argues that Indian literature does not merely reflect developmental milestones; it actively provides an ethical and philosophical blueprint for Vikasit Bharat, ensuring that material progress remains tethered to human dignity and ecological equilibrium.

Introduction: The Developmental Imperative and the Literary Imagination

National destiny is rarely forged in policy white papers alone; it is conceived first in the collective cultural imagination. The vision of Vikasit Bharat@2047—a developed India marking its centenary of independence—articulates a comprehensive roadmap characterized by economic prosperity, infrastructure transformation, institutional democratization, and global civilizational leadership (Vishwa Guru). However, development is not a purely technocratic or quantitative process. As Amartya Sen asserts in Development as Freedom, true progress is measured by the expansion of substantive freedoms and human agency rather than by the sheer gross domestic product (Sen 3–14). The literature serves as a vital interlocutor in this developmental matrix. From the anti-colonial verses of Rabindranath Tagore and Sri Aurobindo to the speculative visions of contemporary Indian science fiction and the grounded realism of regional vernacular prose, literary artists have consistently mapped the trajectory of India. Where national planning focuses on roads, digital grids, and industrial output, the literature asks: What kind of consciousness inhabits this built environment? Whose voices define the progress? How does an ancient civilization preserve its metaphysical core while embracing the vanguard of modernity? This paper examines the literary impressions of Vikasit Bharat@2047 across Indian writing in English and translated regional literatures. By synthesizing speculative fiction, environmental narratives, postcolonial theory, and subaltern discourses, the study maps how writers articulate the promises, tensions, and ethical boundaries of India's centenary horizon.

Philosophical Foundations: From Swaraj to Samriddhi

To understand the literary trajectory toward 2047, one must contextualize the evolution of Indian developmental consciousness. The early 20th-century imagination of free India, evident in Mahatma Gandhi's Hind Swaraj (1909) and Jawaharlal Nehru's The Discovery of India (1946), operated under the dialectics of pastoral self-containment versus Nehruvian industrial modernism. Rabindranath Tagore's celebrated lines in Gitanjali—'Where the mind is without fear and the head is held high / Where knowledge is free'—established an early philosophical benchmark for national realization (Tagore 27). For Tagore, true national awakening was intellectual, ethical, and universalist. In contrast, Munshi Premchand's Hindi masterpiece Godaan (1936) captured the agrarian debt, social stratification, and material destitution that haunted rural India, warning future nation builders that independence without peasant liberation is an incomplete project (Premchand 45–62). The 2047 vision integrates these historical discourses into a new paradigm: Samriddhi (holistic prosperity) underpinned by Atmanirbharta (self-reliance). Contemporary literary representations increasingly move past postcolonial grievance toward an affirmative and confident assertion of civilizational identity. In works such as Amish Tripathi's Shiva Trilogy and Chitra Banerjee Divakaruni's revisionist epics, ancient civilizational philosophies are reimagined to address modern governance, statecraft, and social reform. The literary vision of a developed India by 2047 demands epistemic decolonization—a reclamation of indigenous epistemologies where development is harmonious rather than extractive.

Technological Transcendence and Speculative Futurities

Speculative fiction and climate-tech narratives form the sharpest lens through which writers envisage the year 2047. Indian science fiction (Sci-Fi), written in English and vernacular languages such as Marathi, Bengali, and Tamil, has evolved from mythological retellings into sophisticated socio-technological cartographies. In the anthologies of contemporary speculative writing, such as The Gollancz Book of South Asian Science Fiction edited by Tarun Saint, writers engage directly with artificial intelligence, bioengineering, and hyper-urbanization within the subcontinent. These narratives project an India that has leaped over Western developmental phases through decentralized green technologies and digital public infrastructure.

Technological Realities vs. Ethical Horizons

In Vandana Singh's speculative stories, such as Ambiguity Machines and Other Stories, technological progress is reconfigured through nonlinear, relational philosophies. Singh rejects the dystopian techno-capitalism often found in Western cyberpunk, suggesting that an Indian technological renaissance must balance quantum advancements with ecological and social harmony (Singh 88–104). Conversely, speculative narratives frequently caution against developmental disparities. In Prayaag Akbar's novel Leila (2017), the narrative projects a near-future Indian metropolis characterized by severe spatial segregation, high-tech surveillance, and exclusionary walls erected along caste and class lines (Akbar 34–52). Leila functions as a cautionary literary impression for Vikasit Bharat: true advancement cannot coexist with high-tech ghettoization; the technology of 2047 must serve inclusive citizenship rather than facilitate digital stratification.

Literary Work	Core Developmental Motif	Vision for India@2047
Vandana Singh, *Ambiguity Machines*	Relational Technology & Non-linear Epistemologies	Quantum modernity grounded in holistic Indigenous science.
Prayaag Akbar, *Leila*	Spatial Segregation & Digital Surveillance	Warning against techno-feudalism and socio-economic hyper-stratification
Amitav Ghosh, *The Great Derangement*	Planetary Crises & Post-Carbon Realism	Decentred anthropocentrism and climate-resilient civilizational life
Bama, *Sangati*	Dalit-Feminist Liberation & Grassroots Agency	Grassroots democratization and subaltern socioeconomic parity.

Ecological Stewardship: Prakriti and Sustainable Modernity

A cornerstone of the Vikasit Bharat@2047 agenda is green growth and climate resilience. The Western developmental paradigm, historically reliant on carbon-intensive industrialization and nature subjugation, has proven to be ecologically catastrophic. Indian literature offers a vital corrective by invoking the traditional reverence for Prakriti (nature) as an active agent rather than a passive resource. Amitav Ghosh, in his non-fiction critique The Great Derangement: Climate Change and the Unthinkable and his historical-ecological novels such as The Hungry Tide and Gun Island, argues that the modern novel must awaken to the

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

reality of the Anthropocene (Ghosh, The Great Derangement 11–28). Ghosh highlights the Sundarbans—a volatile, porous ecosystem—as an emblem of India's environmental fragility and resilience. In Gun Island, Ghosh weaves Bengali folklore into a contemporary narrative of global climate migration and ecological collapse (Ghosh, Gun Island 142–159). For Vikasit Bharat to be meaningful in 2047, Indian literary discourse insists on ecological swaraj: reconnecting urban expansion with riparian ecosystems (as depicted in the poetry of Mamang Dai and Keki Daruwalla) and moving beyond industrial monoculture toward regenerative agro-ecologies. Literature reminds the nation that a developed India with toxic aquifers, degraded soils, and unbreathable air is a contradiction in terms.

Inclusive Prosperity: Subaltern Voices and Gender Parity

No vision of a developed nation is complete without the systematic dismantling of structural inequalities. Literature written from marginalized perspectives—specifically, Dalit, Adivasi, and feminist writings—provides a sharp diagnostic test for the authenticity of Vikasit Bharat.

Dalit Literature: The Measure of Emancipatory Progress

Dalit literature asserts that development without social justice is an illusion. In Bama's Tamil work Sangati (1995), the collective strength of Dalit women highlights an irrepressible drive toward autonomy, dignity, and economic self-determination (Bama, 22–45). Similarly, Omprakash Valmiki's autobiography, Joothan, exposes the psychological and physical violence of caste exclusion (Valmiki 12–30). Projecting toward 2047, subaltern literature charts a transition from resistance to institutional representation and entrepreneurial leadership, establishing that the centenary India must be inherently caste-annihilative (Prabuddha Bharat).

The Gender Horizon: Redefining Public and Private Spheres

The trajectory toward 2047 requires an overhaul of the patriarchal architecture. In contemporary Indian fiction, female characters occupy boardrooms, research labs, diplomatic corps, and grassroots governing bodies (panchayats). The literary representation of womanhood departs from sacrificial archetypes toward self-actualized agents of nation-building, ensuring that care work is valued and public safety is universalized.

Decolonizing Mindscapes and the Global Civilizational Role

A central pillar of the 2047 vision is India's role as a global stabilizer and cultural leader—Vishwa Guru—rooted in the philosophy of Vasudhaiva Kutumbakam (the world is one family). Indian writing in English serves as a primary cultural bridge, translating the country's pluralistic heritage into a global intellectual currency. This decolonial turn represents what Gayatri Chakravorty Spivak terms 'strategic essentialism' and epistemic re-centering (Spivak 205–218). In an interconnected 2047, Indian literature envisions a nation that interacts with the Global South and North not as a supplicant, but as an equal co-creator of planetary thought, sustainable philosophy, and diplomatic consensus.

Conclusion: Literature as the Conscience of 2047

The literary impressions of Vikasit Bharat@2047 demonstrate that the journey toward a centenary developed status is fundamentally humanistic. Literature performs two indispensable functions in this developmental trajectory: it provides an inspiring vision that celebrates self-reliance and discovery, and it acts as a vigilant conscience that interrogates the blind spots of rapid modernization. As India marches toward 2047, literature ensures that the nation's development remains anchored to its civilizational soul: materially prosperous (Samriddha), technologically advanced (Unnat), socially just (Nyaypurna), and ecologically harmonious (Prakriti-Rakshak).

Acknowledgement

I would like to express my sincere gratitude to all those who supported and encouraged me in the completion of this research paper, "Visions of Tomorrow: Literary Cartographies of Vikasit Bharat@2047 in Indian and Anglophone Literatures." I am deeply grateful to my academic colleagues, mentors, and fellow researchers for their valuable suggestions, intellectual encouragement, and constructive insights, which contributed significantly to the development of this study.

Financial support and Sponsorship

Abstract

The continuing advancement of Artificial Intelligence (AI) is creating new possibilities for higher education and academic library development. The increasing volume of digital information, expansion of online education, and growing complexity of scholarly communication require libraries to provide faster, more responsive, and user-oriented information services. AI can assist academic libraries in areas such as intelligent discovery of scholarly resources, automated reference assistance, resource recommendation, metadata creation, research support, collection analysis, and digital preservation. This paper examines the emerging applications of AI in academic libraries and considers how these developments can support the broader objectives of Viksit Bharat@2047. Particular attention is given to the advantages of AI as well as concerns involving accuracy, privacy, copyright, ethics, infrastructure, digital inequality, and professional competencies. The paper argues that AI should function as an enabling technology rather than a substitute for librarians. The combination of computational capabilities with professional knowledge and human judgement can transform academic libraries into more responsive centres for learning, research, innovation, and knowledge sharing. Properly implemented AI-based library services can therefore strengthen the contribution of academic libraries to quality education, research capacity, digital literacy, and inclusive access to knowledge, thereby supporting India's long-term development aspirations.

Keywords: *Artificial Intelligence, Academic Libraries, Viksit Bharat@2047, Digital Libraries, AI Literacy, Research Support, Library Services*

Introduction

The academic information environment has undergone substantial transformation with the growth of digital technologies. In the past, students and researchers depended largely on printed books, journals, encyclopaedias, reference works, and other materials physically available in libraries. The introduction of computers and automated library systems subsequently changed the way collections were organized and accessed. The expansion of the internet and electronic publishing further accelerated this transformation. Contemporary academic libraries now provide access to a wide range of electronic resources, including e-books, e-journals, online databases, institutional repositories, electronic theses and dissertations, and other digital scholarly materials. Many of these resources can be consulted remotely, facilitating users to obtain information without being physically present in the library. Consequently, the academic library has increasingly become an integral component of the digital teaching, learning, and research ecosystem. Artificial Intelligence represents the next significant stage in this technological development. AI systems are capable of processing large volumes of information, recognizing patterns, interpreting natural language, generating responses, and assisting with decision-making.

Website: https://bnir.us

Within the library environment, these capabilities can be applied to information discovery, recommendation, classification, automation, reference assistance, and several other activities. Existing literature indicates that intelligent technologies have considerable potential for transforming library operations and services (Asemi et al., 2021). The development of AI is also expected to influence the responsibilities and competencies of information professionals (Cox, 2021). The emergence of AI creates both opportunities and responsibilities for academic libraries. Libraries need to identify areas where intelligent technologies can enhance services while simultaneously ensuring that AI-generated information is evaluated carefully. The significance of these developments becomes greater when viewed against India's long-term development objective of Viksit Bharat@2047. A developed India requires strong educational institutions, research capabilities, technological capacity, innovation, and skilled human resources. Academic libraries contribute directly to these objectives by supporting access to information and facilitating teaching and research. The National Education Policy 2020 places considerable importance on digital education, technology, research, innovation, and the development of new competencies. It therefore creates an appropriate policy environment for academic libraries to explore responsible applications of AI (Government of India, 2020). AI-enabled library services can potentially strengthen the contribution of academic libraries to higher education and, more broadly, to India's knowledge economy.

Objectives of the Study

The study has the following objectives:

1. To examine the emerging role of Artificial Intelligence in academic libraries.
2. To identify important areas in which AI can be incorporated into academic library services.
3. To examine the potential benefits of AI for students, teachers, and researchers.
4. To analyse the principal challenges associated with AI adoption in academic libraries.
5. To examine how AI is influencing the responsibilities and competencies of librarians.
6. To explore the potential contribution of AI-enabled academic libraries to the objectives of Viksit Bharat@2047.

Research Methodology

The present study follows a descriptive and exploratory approach and is based primarily on secondary information. Relevant research publications, professional literature, policy documents and selected literature concerning Artificial Intelligence, academic libraries, digital transformation, and AI literacy were examined.

The study concentrates on emerging applications of AI within academic library environments and considers their implications for educational support, scholarly research, information services, professional practice, and national development. The discussion is conceptual and exploratory rather than based on primary survey data.

Artificial Intelligence and Academic Libraries

The usefulness of Artificial Intelligence in libraries extends beyond technical processing and can also include direct interaction with students, teachers, and researchers. Asemi et al. (2021) discuss the application of intelligent technologies in several library-related functions, including information services, expert systems, and automation. Similarly, Oyelude (2021) identifies AI as an important technological development with implications for the future direction of libraries. The technological evolution of academic libraries may broadly be viewed through the following progression:

Traditional Library
↓
Automated Library
↓
Digital Library
↓
AI-Enabled Library

Each stage represents a change in the manner in which information is organized, accessed, and delivered. Traditional libraries were primarily collection-oriented and depended heavily on physical materials. Automation introduced computerized processes for activities such as circulation and cataloguing. Digital libraries expanded access to electronic information. The AI-enabled library adds intelligent capabilities that can assist users with discovery, recommendations, interpretation, and information services.

AI should therefore be viewed as an additional capability within the library rather than as a replacement for the institution or its professionals. Its greatest value can be achieved when automated capabilities are combined with the knowledge, ethical responsibility, and contextual understanding of librarians.

Major Applications and Benefits of AI in Academic Libraries

Intelligent Discovery of Information

Information discovery is a fundamental function of academic libraries. Conventional search systems generally depend on predefined keywords, author names, titles, subjects, or classification terms. Such systems can sometimes make it difficult for inexperienced users to express complex information

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

requirements. AI can provide a more conversational approach to information discovery. Users may formulate questions using ordinary language, while an intelligent system can identify concepts within the query and suggest potentially relevant scholarly resources. For example, a student could ask an AI-enabled library system to identify recent scholarly literature concerning AI and higher education in India. The system could assist in locating related journal articles, books, theses, reports, and other academic resources. Such intelligent discovery mechanisms can reduce the effort involved in locating relevant information and may improve the overall search experience (Asemi et al., 2021).

AI-Assisted Reference Services

Reference services are traditionally based on interaction between librarians and users. Many routine enquiries, however, concern straightforward matters such as library timings, membership procedures, availability of books, access to electronic resources, database use, and library regulations. AI-powered chatbots and virtual assistants can respond to such frequently asked questions. They can provide basic assistance at times when library staff may not be available, thereby extending the accessibility of library services.

AI in Cataloguing and Metadata Creation

Cataloguing and metadata management require considerable intellectual and technical effort. AI can support librarians by extracting descriptive information from digital documents and suggesting keywords, subjects, categories, and other metadata elements. Such assistance can reduce repetitive processing and potentially accelerate the organization of digital resources. It may be particularly useful when libraries are required to process growing volumes of electronic material.

Automated suggestions, however, should not be accepted without professional review.

AI-Based Recommendation Services

The large volume of scholarly information available today can make it difficult for users to identify resources that extend beyond their initial search. AI-based recommendation systems can help address this problem.

When a user searches for a particular subject, an intelligent system can identify related resources and recommend books, articles, theses, reports, or other relevant materials. Such systems can encourage users to explore related areas and discover literature that may not have appeared in a narrowly formulated search. Recommendation and discovery are among the significant possibilities associated with intelligent library environments (Asemi et al., 2021; Oyelude, 2021).

AI for Research Support

Researchers must locate relevant literature, follow developments within their disciplines, organize information, and identify emerging research directions.

AI tools can assist with activities such as:

- Discovering scholarly literature,
- Exploring unfamiliar research topics,
- Identifying emerging research trends,
- Locating related studies,
- Generating research alerts and
- Organizing large quantities of information.

The increasing influence of AI also means that librarians need to strengthen their ability to support researchers working with intelligent technologies. Cox (2023) notes that AI may influence both academic library work and the competencies required by information professionals.

AI in Collection Development

Collection development requires libraries to identify resources that correspond with the changing academic and research requirements of their users. Data generated through library systems can provide useful evidence for this process.

AI-assisted analysis can help librarians examine patterns such as:

- frequently consulted resources;
- subject-level demand;
- usage of electronic resources;
- weaknesses or gaps within existing collections; and
- emerging areas of research interest.

Such analysis can support evidence-based collection planning. Nevertheless, collection decisions involve academic, institutional, financial, and professional considerations that cannot be delegated entirely to an automated system.

AI and Digital Preservation

Academic institutions continuously produce digital content, including research papers, theses, dissertations, reports, institutional publications, and other scholarly records. Preserving these materials is essential for maintaining the intellectual memory of an institution.

AI can support digital preservation by helping organize large collections, improve descriptive metadata, identify duplicate records, and assist with the management of digital materials.

AI and Viksit Bharat@2047

The vision of Viksit Bharat@2047 is closely associated with educational advancement, research, innovation, technological development, and the

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

creation of skilled human resources. Academic libraries can contribute to these objectives because they provide the information infrastructure required for learning and scholarly activity.

The relationship can be conceptualized as follows:

AI-Enabled Academic Libraries
↓
Reliable Knowledge Access
↓
Quality Education

↓
Research and Innovation
↓
Skilled Human Resources
↓
Knowledge-Based Society
↓
Viksit Bharat@2047

- **Strengthening Quality Education**

Students require dependable and current information to support their academic work. AI-enabled libraries can improve access to digital books, journals, databases, repositories, and other learning materials.

By making relevant resources easier to discover, AI can complement classroom teaching and support independent learning.

- **Encouraging Research and Innovation**

A strong research ecosystem requires efficient access to scholarly information. Academic libraries can use AI-supported discovery and research services to help researchers identify relevant publications, follow emerging developments, and explore new areas of investigation.

Improved research support can contribute to innovation and the creation of new knowledge, which are important components of national development.

- **Developing AI and Digital Literacy**

The growing use of AI makes it increasingly important for students and researchers to understand both the capabilities and limitations of intelligent systems.

Academic libraries can contribute by organizing programmes dealing with:

- AI literacy;
- information literacy;
- digital literacy;
- research skills;
- responsible use of generative AI; and
- critical evaluation of online information.

Such programmes can help learners become more capable and responsible users of digital and AI-enabled information environments.

Promoting Inclusive Access to Knowledge

Students and researchers in rural and semi-urban institutions can benefit from electronic resources and online library services when appropriate infrastructure is available. This dimension is particularly important for inclusive educational development. AI can strengthen access, but technological expansion must be accompanied by measures to address connectivity, affordability, infrastructure, and digital skills.

- **Supporting Knowledge Creation**

Libraries provide the information foundation upon which research and knowledge creation depend. By improving discovery, organizing information, and strengthening research assistance, AI can enhance the research environment of higher education institutions.

In this manner, the AI-enabled academic library can function as an active component of the knowledge-production ecosystem.

AI, NEP 2020 and Academic Libraries

The National Education Policy 2020 emphasizes technology-enabled education, research, innovation, multidisciplinary learning, and the development of contemporary skills. It also recognizes the growing importance of emerging technologies, including Artificial Intelligence and machine learning (Government of India, 2020).

Libraries can support the objectives of NEP 2020 by:

- Expanding access to digital learning materials,
- Facilitating multidisciplinary information access,
- Strengthening research-oriented services,
- Developing information and digital literacy,
- Providing electronic scholarly resources,
- Supporting lifelong learning,
- Introducing AI literacy initiatives, and
- Encouraging research and innovation.

Academic libraries can consequently function as an important link connecting technological development, NEP 2020, higher education, and the broader vision of Viksit Bharat@2047.

Challenges of AI Adoption in Academic Libraries

Despite its potential, the adoption of AI presents several practical, professional, ethical, and institutional challenges. Recent literature emphasizes concerns regarding safe implementation, professional competencies, ethics, privacy, and institutional preparedness (Ngulube & Mosha, 2024).

1. Accuracy and Reliability

AI systems can produce incorrect or misleading information. This is particularly significant in academic environments where users depend upon

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

information for research and decision-making. AI-generated responses should therefore be evaluated and verified against trustworthy sources.

2. Privacy

Library services traditionally place considerable importance on protecting user privacy. AI systems may require access to user interactions, search behaviour, or other data. Libraries must therefore establish appropriate practices concerning data collection, storage, processing, and access.

3. Copyright and Intellectual Property

The relationship between AI systems and copyrighted scholarly content raises complex intellectual-property questions. Academic libraries require clear institutional policies concerning the use of copyrighted materials in AI-supported environments. IFLA has identified copyright and related legal issues as important considerations in the relationship between libraries and AI (IFLA, 2025).

4. Ethical Issues

AI-generated results can contain bias or misleading information. Responsible implementation therefore requires attention to transparency, fairness, accountability, and human oversight. UNESCO (2021) emphasizes the importance of ethical principles in the development and use of AI.

5. Financial Requirements

The implementation of AI may involve expenditure on hardware, software, connectivity, maintenance, data management, system integration, and professional training. Institutions therefore need realistic implementation plans that consider both initial and continuing costs.

6. Professional Competency

The introduction of AI changes the skills expected from librarians. Information professionals increasingly require knowledge of AI tools, digital systems, data, research support, information evaluation, privacy, copyright, and ethical technology use.

Cox (2021, 2023) highlights the influence of technological transformation on the competencies and responsibilities of information professionals. Continuous professional development is therefore essential.

Conclusion

Artificial Intelligence offers academic libraries an important opportunity to redesign and strengthen their services in response to the rapidly changing information environment. Its applications can support scholarly discovery, reference assistance, metadata development, resource recommendation, research services, collection analysis, and digital preservation. These capabilities can improve access to information while enabling librarians to concentrate on more complex educational and research requirements. At the same time, successful AI adoption depends on responsible attention to accuracy, privacy, copyright, ethics, infrastructure, digital inequality, and professional competency. AI should therefore be integrated as a supportive technology rather than viewed as a substitute for librarians. By strengthening education, research, innovation, digital literacy, and equitable access to scholarly information, AI-enabled academic libraries can make a meaningful contribution to the development of India's knowledge society and to the long-term vision of Viksit Bharat@2047.

Abstract

Graphene oxide (GO) is a two-dimensional carbon-based nanomaterial derived primarily from the oxidation and exfoliation of graphite. The incorporation of oxygen-containing functional groups such as hydroxyl, epoxy, carbonyl, and carboxyl groups into the graphene lattice gives GO distinctive physicochemical characteristics, including a high specific surface area, hydrophilicity, tunable surface chemistry, mechanical strength, optical activity, and excellent ability to undergo chemical functionalization. These properties have made GO and GO-based nanocomposites attractive for applications across environmental, biomedical, energy, electronic, catalytic, and structural fields. This review presents a comprehensive assessment of the major applications of GO nanoparticles, with particular emphasis on developments reported during 2022–2025. The applications discussed include water and wastewater treatment, adsorption of heavy metals and organic contaminants, membrane separation, photocatalysis, energy storage, supercapacitors, lithium-ion batteries, electrochemical and biosensors, electronics, photonics, and optoelectronics. Future research should focus on green synthesis, standardized characterization, surface engineering, life-cycle assessment, toxicity evaluation, and scalable fabrication of GO-based devices and composites. Overall, GO represents a versatile platform material with substantial potential for next-generation environmental, energy, biomedical, and multifunctional technologies.

Keywords: *Graphene oxide; GO nanoparticles; nanotechnology; water treatment; energy storage; biosensors; drug delivery; photocatalysis; nanocomposites.*

Introduction

The rapid development of nanotechnology has resulted in extensive research into low-dimensional materials with controllable structural, electronic, optical, chemical, and mechanical properties. Among these materials, graphene and its derivatives have received exceptional attention because of their combination of high surface area, mechanical strength, electrical conductivity, and tunable surface chemistry. Graphene oxide (GO) is particularly attractive because oxidation introduces oxygen-containing functional groups onto the graphene framework, making the material considerably more hydrophilic and chemically reactive than pristine graphene [1–4]. GO generally consists of a two-dimensional carbon framework containing hydroxyl, epoxy, carbonyl, and carboxyl functionalities.

Website: https://bnir.us

These groups influence the electronic structure, surface charge, hydrophilicity, chemical reactivity, and dispersibility of GO. Consequently, GO can be readily dispersed in water and chemically modified with polymers, metals, metal oxides, biomolecules, nanoparticles, and other functional materials [1,4,5]. The properties of GO are strongly dependent on the synthesis method and oxidation degree. Chemical oxidation remains one of the most widely used approaches, although electrochemical, mechanical, and greener synthesis routes are increasingly being investigated. The choice of synthesis conditions affects flake size, defect density, oxygen content, surface chemistry, and consequently the performance of the final material [3,8]. This review therefore examines the major applications of GO nanoparticles and GO-based nanocomposites, focusing on recent developments and technological challenges.

Structure and Fundamental Properties of Graphene Oxide

Graphene oxide can be considered an oxidized derivative of graphene in which oxygen-containing groups are attached to the carbon network. Hydroxyl and epoxy groups are generally distributed over the basal plane, while carbonyl and carboxyl groups are commonly associated with sheet edges and defect sites [1,3].

The presence of oxygen functionalities produces several important characteristics:

1. **High specific surface area:** GO provides extensive surface sites for adsorption and chemical interactions.
2. **Hydrophilicity:** Oxygen-containing groups allow GO to form stable aqueous dispersions.
3. **Surface functionalization:** GO can be chemically modified through covalent and non-covalent approaches.
4. **Mechanical strength:** Individual GO sheets retain much of the mechanical robustness associated with graphene.
5. **Optical properties:** Defects and oxygen functionalities produce tunable optical absorption and photoluminescence.
6. **Electrical properties:** GO is substantially less conductive than graphene, but controlled reduction can produce reduced graphene oxide (rGO) with much higher electrical conductivity.
7. **Chemical reactivity:** Functional groups enable interactions with metals, polymers, biomolecules, and organic compounds [3,8].

Recent studies have emphasized that GO should not simply be considered an intermediate for producing graphene. Its own combination of hydrophilicity, surface reactivity, optical characteristics, and processability creates an application space that differs substantially from pristine graphene [9].

Major Applications of Graphene Oxide Nanoparticles

Water Purification and Wastewater Treatment

Water treatment is among the most extensively investigated applications of GO. Industrial and domestic wastewater may contain heavy metals, dyes, pharmaceutical compounds, pesticides, endocrine-disrupting compounds, and microorganisms. GO possesses a high surface area and numerous oxygen-containing functional groups, allowing it to interact strongly with many contaminants [11–15].

GO can be used as:

- an adsorbent,
- a membrane component,
- a photocatalyst support,
- an antifouling material,
- an antimicrobial material, and
- a component of multifunctional filtration systems.

Lithium-Ion Batteries

GO and rGO have also been explored as electrode components and conductive frameworks in lithium-ion batteries.

The advantages include:

- large surface area,
- short ion-diffusion pathways,
- structural flexibility,
- high electrical conductivity after reduction,
- ability to accommodate volume changes, and
- compatibility with metal oxides and other active materials.

GO-derived materials can be combined with silicon, metal oxides, sulfur, and other electrode materials to improve structural stability and charge transport. A major challenge is achieving a balance between high capacity, high conductivity, long cycle life, and scalable manufacturing.

Other Energy-Conversion Applications

GO has also been investigated in fuel cells, solar-energy systems, photocatalytic hydrogen production, batteries, and electrochemical energy-conversion systems. Functionalized GO can act as a catalyst support, charge-transfer medium, or structural component [2,7].

Sensors and Biosensors

The high surface area and functionalization capability of GO make it attractive for chemical and biological sensing.

GO-based sensors have been investigated for detecting:

- glucose,

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

- dopamine,
- hydrogen peroxide,
- heavy-metal ions,
- pesticides,
- proteins,
- DNA and RNA,
- cancer biomarkers,
- pathogens, and
- environmental pollutants.

GO can be integrated with electrodes, metal nanoparticles, conducting polymers, enzymes, antibodies, aptamers, and other recognition elements.

Electrochemical Sensors

GO can increase the effective surface area of an electrode and provide functional groups for immobilization of recognition molecules. GO/rGO composites can also enhance electron transfer when appropriately engineered. Recent reviews report significant progress in GO-based electrochemical sensors for healthcare and environmental monitoring [28,29].

Biosensors

GO can interact with DNA, RNA, proteins, enzymes, and antibodies. This makes it useful for developing biosensors capable of detecting biological molecules at low concentrations. Applications include early detection of disease biomarkers, monitoring of glucose, detection of bacterial and viral pathogens, and cancer-related diagnostics [29,30].

Biomedical Applications

GO nanoparticles have attracted considerable interest in nanomedicine because their large surface area and functional groups permit attachment of therapeutic molecules and biomolecules.

Potential biomedical applications include:

- drug delivery,
- gene delivery,
- cancer therapy,
- photothermal therapy,
- photodynamic therapy,
- bioimaging,
- biosensing,
- tissue engineering,
- antimicrobial systems, and
- vaccine-related technologies.

Electronics, Photonics and Optoelectronics

GO exhibits unique optical and electronic properties that can be modified through chemical reduction and functionalization.

Applications include:

- photodetectors,
- optical modulators,
- flexible electronics,
- transparent conductive systems,
- light-emitting devices,
- nonlinear optical devices,
- sensors,
- memory devices, and
- photonic systems [9].

The optical response of GO is related to its sp^2 carbon domains, defect structure, and oxygen functionalities. Reduction of GO partially restores the sp^2 network and changes its electrical and optical behavior. Recent research demonstrates that GO is particularly interesting for photonics because its optical properties can be chemically and physically tuned [9].

Composite Materials

GO is widely used as a reinforcing phase in polymer, ceramic, metallic, and cementitious composites. Its two-dimensional geometry allows a small quantity of GO to influence the microstructure of a composite substantially.

GO can improve:

- mechanical strength,
- fracture resistance,
- thermal properties,
- electrical conductivity,
- barrier properties,
- durability, and
- interfacial bonding.

GO nanocomposites are particularly attractive for lightweight structural materials, coatings, packaging, and electronic components.

Conclusion

Graphene oxide is one of the most versatile two-dimensional nanomaterials currently investigated for technological applications. Its high surface area, oxygen-containing functional groups, hydrophilicity, mechanical strength, tunable optical and electronic properties, and ease of functionalization provide a unique combination of characteristics. Among its most promising applications are water purification, wastewater remediation, adsorption, membrane separation, photocatalysis, supercapacitors, batteries, electrochemical sensors, biosensors, drug delivery, cancer therapy, antimicrobial materials, tissue engineering, construction materials, protective coatings, catalysis, and optoelectronics. Future research should therefore move beyond demonstrating laboratory-scale performance and focus on standardized materials, sustainable production, long-term stability, life-cycle assessment, realistic operating conditions, and safe-by-design approaches. If these challenges can be addressed, GO-based materials have substantial

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

potential to contribute to next-generation environmental, energy, biomedical, electronic, and structural technologies.

Acknowledgement
I would like to express my sincere gratitude to everyone who has contributed, directly or indirectly, to the successful completion of this review paper entitled "The Various Applications of Graphene Oxide (GO) Nanoparticles: A Comprehensive Review." I am deeply thankful to my institution, MVP Samaj's Karmveer Punjababa Govardhane Arts Commerce Science College, Igatpuri, affiliated with Savitribai Phule Pune University, Pune, for providing an encouraging academic environment and the necessary support for carrying out this work.

Financial support and Sponsorship

Abstract:

In today's era, Ai have revolutionized all segments of the industries including the banking and financial services, The tedious work has been done more efficiently because of AI. It is being proofed that AI has become a very important phenomenon in banking and financial services. Decisions are taken without any mistake and customers are given better services. In Indian banking system AI is used in especially in approving and disbursement of the loan cases which reflects in faster loan approval procedure experienced by the customers. The reason behind this study is to examine the emerging trends, Opportunities and challenges in the Indian home loan services. For the study secondary and published data is utilized. The information is collected from the reliable sources such as Peer Reviewed Journals, RBI Reports, NHB reports, Banking and housing financial corporations, Government of India's authenticated publications, Different reports published by the businesses. The information is utilized for the study from 2019 to 2025. The research is based on descriptive and analytical method. The information available is analyzed and being presented in the study. On the basis of the research it is came to known that AI is used in measurably all steps of home loan application process and it is increasing its limits. Ai is used in the following steps -customer registration, Credit assessment, Verification of documents, Fraud's detection, Property valuation, Better customer services. In the study, the opportunities created by the AI is discussed which includes Increase in work efficiency, Reduction in time of home loan approval, Risk management is done more efficiently, Able to provide personalized services to the customers, Similarly, there are certain challenges while Using AI which are Data Privacy, Cyber security, AI Algorithmic Bias, Transparency in decision making, Regulatory compliances. To conclude the study as per the findings is that the AI should be used or implemented very carefully, and with proper planning, this will help & strengthen Indian banking and Homeloan services. AI in home loan will increase its efficiency, help in inclusiveness of all types of customers, and longterm dependability will be seen. Also, because of AI Financial institutions and policymakers will take better decisions.

Keywords: *Artificial Intelligence (AI), Home Loan Services, Housing Finance, Digital Lending, Banking, Cyber security*

Introduction

Due to fast development in digital technology, the working of financial institutions, its competitiveness and serviceability is completely revolutionized. In this technological change Artificial Intelligence - AI is helping in creativity and innovation by facilitating computers to do the task which routinely require human intelligence, which includes learning, reasoning the pattern recognition and better decision making. With use of latest technologies like Machine Learning, Natural Language Processing (NLP), Computer Vision and Predictive Analytics, Generative AI, the Ai helps organizations to do analysis of structured and unstructured data, automate routine processes, and generate actionable insights.

Quick Response Code:

Website: https://bnir.us

Because of this different business industries are adopting AI to prepare their strategies. The benefits of using AI are that it increased the operational efficiency, better customer experience, risk management becomes more effective, and informed and feasible decisions can be taken. Financial services industry are revolutionized due to AI in a fast manner, also banks are able to deliver fast, error free and customer centric services. AI is proved to be strengthening bank services and long term value building technology. [1] Increasing AI Usage in the Indian Banking System: in the last decade, Indian Banking Industry have witnessed digital transformation in itself. Behind this fast developing technology, governments support for different programs and ever changing expectations of customers and International banking competition are the main reasons. The development done under the Digital public infrastructure (DPI) have strengthen the digital finance management, the DPI includes- Aadhar, Unified payment Interface (UPI), Account Aggregator (AA), Unified Lending Interface (ULI), CIBIL is Credit Information Bureau (India) Limited. Founded in August 2000, etc,. Because of these digital developments banking and housing finance corporations are able to use AI based services easily. Today banks and housing finance companies use AI for the services such as - Customer On-boarding, Credit Appraisal, Fraud Detection, Regulatory Compliance, Personalized Financial Services, and Customer Support [2]. By seeing the growing importance of AI in the Indian financial sector, Reserve Bank of India (RBI) developed the policies, measures to promote the Responsible and Ethical usage through governance frameworks, and encouraging innovation in digital lending and risks management [3]. Concluding that the AI in not a future technology, it has become the important integral part of the developing Indian digital banking and Home loan industry. Home Loan Services: In Indian retail lending market, home loan is an important factor. To motivate one to have their own home, to strengthen the city development and inclusive economic growth, home loan finance plays a major role. In last few decades, housing finance sector is continuously developing; behind this the reasons are increase in family income, fast urbanization, government initiative towards housing development in the country, easy availability of Institutional credit. According to the report of National Housing Bank- NHB, the share of housing finance in retail business is increasing; it is playing an important role in strengthening the Indian Financial market[4]. Traditionally, the housing finance is tedious and time consuming and was paper based. It included physical customer verification, Income assessment, Property valuation, legal scrutiny, loan documentation and credit appraisal. In all this process human manual intervention was required, it was time consuming, which increases the cost of application/process and also there were more chances of mistakes done by the individuals. In today's era customer requirements are fast processing, transparent and customer centric home loan services. Therefore banks and financial services institute are increasing the usage of Artificial Intelligence (AI) in different steps of home loan process. Due the use of AI following things are improving in a vast manner- It is Increasing the work efficiency, decision making process is becoming accurate, service quality and its parameters are improving, customer experience is getting better. Seeing the ever developing field of Housing loan, the importance of technology enabled innovation is increased.

Review of Literature :

Bussmann et al. (2021) performed a study on the use of explainable machine learning in credit risk management. This study revealed that while artificial intelligence is useful in credit risk modeling, its decisions should be explainable and transparent. It is a crucial consideration, given the need to promote transparency in the application of artificial intelligence in financial services and banking [7]. Gramegna and Giudici (2021) conducted a similar study on the use of explainable AI in credit risk assessment. This research discusses the explainability of credit risk scores made using machine learning algorithms and the use of the SHAP and LIME methods in the process. In general, the study underscores the importance of interpretability in artificial intelligence, especially in implementing credit risk scoring in finance [8]. Bastos and Matos (2022) evaluated explainable models for credit loss analysis. According to this study, model transparency is a crucial requirement in credit risk modeling due to the complexity of machine learning models and the resulting risks of hidden biases in the processes. In general, the research highlights the importance of balancing predictive accuracy and model interpretability while reducing bias [9]. In contrast, Kalyani and Gupta (2023) performed a systematic review of the literature on the use of Artificial Intelligence and Machine Learning in the banking industry. A total of 734 articles were reviewed, and the results revealed a growing trend in the use of artificial intelligence and machine learning in the banking industry. It also discusses the potential opportunities and threats of the increased use of technology in the financial sector [2]. Cerneviciene and Kabasinskas (2024) reviewed the literature on the application of Explainable Artificial Intelligence

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

in finance. According to the findings, since the use of artificial intelligence in finance is growing, it is important to ensure transparency and explainability of the results for risk assessment, analytics, and decision-making purposes. Generally, the study recommends the need to consider explainability to promote trust in the use of AI in finance [10].

Research Gap: From the review of literature, it is evident that there is a growing trend in the use of artificial intelligence and machine learning in credit risk management and other financial services and banking activities [2], [7]-[10]. However, most of the discussions are general and do not specifically address the application of the technology in the home loan services sector in India. As such, this study will focus on addressing the trends, applications, opportunities, and challenges of artificial intelligence in Indian home loan services between 2019 and 2025.

Need of the study: Due to Artificial Intelligence (AI) banking and finance service sector is changing drastically. The AI has improvised operational efficiency, credit assessment, Loan Processing automation, personalized financial services are provided like communication in their mother tongue etc. driven by the fast developing digital banking ecosystem in India, with the help of AI it is possible to banks and financing institutions to meet the customer expectations by giving fast customer service, maintain transparency, and customer centric home loan services.[2]-[3] In banking and digital finance sector, there has been considerable research done on AI, there is limited in depth research that is comprehensively examining the usage of AI in Indian housing finance services by collaborating insights from recent academic studies, regulatory changes and the industry practices. Thatswhy, it is crucial to study and examine the emrging the trends, opportunities present, and unseen chanllenges associated with the use of AI in home loan services in India.

Study Objective : By considering the above facts, the present research examines the role of AI in the Indian Home loan services is studied in-depth on the basis of secondary data. For the research, trusted sources of data such as research articles from Peer Reviewed journals, publications of Reserve bank of India, National Housing banks reports, Banks and Housing finance companies annual reports, Government of India's official documents, different reports of business's/ industry are analyzed. The published data used for the study during the period from 2019 to 2025. The main objectives of the research are

- To analyze the emerging trends in the usage of AI in Indian Housing finance services.
- To study the use of AI in different stages of home loan process
- To identify the opportunities created by the use of AI in home loan services.
- To study the technological, ethical, operational and regulatory challenges of AI Implementation

The present research study involves analysis of information from different trusted sources Therefore, the study helps to develop a comprehensive and clear understanding of AI Based Indian Home loan services. The output of the study could prove important for the stakeholders such as Financial Institutions (FI's), Policy framers, Researchers, Banking and housing finance sectors practitioners. In Indian Housing Finance sector, considering AI's Importance a detailed study is much needed.

Limitations of the Study : This research has various limitations, as it relies solely on data already published in academic journals, reports, books, articles, and other sources. Moreover, the study is limited to exploring AI adoption in the home loan sector in India from 2019 to 2025. It does not include primary data collected from borrowers, professionals working in the banking sector, and other stakeholders.

Research Methodology : The current research involves a descriptive and analytical study based on secondary data. This paper will cover the period from 2019 to 2025 and focus on investigating the trends, opportunities, and challenges of implementing Artificial Intelligence (AI) in the home loan sector in India. The current research will utilise secondary data from academic journals, reports by the Reserve Bank of India (RBI) and National Housing Bank (NHB), government reports, bank and housing finance company reports, and industry research. The current study will use information considered relevant and reliable on the topic of AI adoption in the home loan industry and apply descriptive and thematic analysis methods.

i .Period of the Study : The present study has been undertaken for the period of 2019-2025. This will help to study the recent trend in Artificial Intelligence and its increasing inclination towards the banking, digital lending and home loan sector of India.

ii. Theoretical Framework :

The study is guided by the Technology–Organization–Environment (TOE) Framework proposed by Tornatzky and Fleischer (1990)[6]. The framework argues that technology adoption at the

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

organizational level is influenced by technological aspects, organizational readiness and the external environment. In the present study, the TOE framework will be used to understand the adoption of Artificial Intelligence (AI) in home loan services by banks and housing finance companies in India.

iii. Tools of Analysis : The study will use descriptive and analytical tools to analyze secondary data. Percentage analysis, trend analysis, tables and graphical presentation will be used wherever applicable to identify and interpret major trends of AI adoption in home loan services. The findings will also be analyzed thematically to examine the major opportunities and challenges of AI adoption in the sector.

Analysis and Discussion:

i. Trends and Applications of AI in Home Loan Services in India : The analysis of secondary data indicates that the adoption of Artificial Intelligence (AI) in home loan services has gradually increased over 2019–2025[2], [3]. In particular, banks and housing finance companies are utilizing AI and automation technologies in multiple stages of the loan process, including consumer onboarding, e-KYC, credit scoring, document verification, fraud detection, client support and loan processing[3].

Table 1: Major Applications and Trends of AI in Home Loan Services

Area	Key Application/Trend
AI Adoption	Increasing use in banking and lending services
Customer Onboarding	e-KYC and automated processes
Credit Assessment	AI-based credit scoring and risk analysis
Fraud Detection	Identification of unusual patterns
Customer Service	AI chatbots and virtual assistants
Loan Processing	Automation of routine activities
Major Challenges	Data privacy, bias, cybersecurity and regulation

Source: Author's compilation based on secondary sources. [2], [3], [7]–[10].

Interpretation: Based on Table 1, it can be asserted that AI utilization spans diverse areas of home loan services, including customer onboarding and credit scoring to customer support and fraud detection. Its implementation could enhance processing efficiency, risk assessment and customer service by automating routine procedures. Nevertheless, the increased reliance on AI entails several concerns, including data privacy, cybersecurity, algorithmic bias and regulatory compliance. Consequently, AI presents significant opportunities for enhancing home loan services, albeit with appropriate governance, transparency and customer protection mechanisms.

ii. AI in Home Loan Life Cycle : It is worth noting that artificial intelligence finds its application in a wide range of areas related to the home loan life cycle. In particular, banks and housing finance companies utilize such technologies to offer customer service, complete on-boarding, perform credit evaluations, analyze documentation, detect fraudulent transactions, and provide loan servicing. In this context, the use of AI-driven chatbots allows delivering the best customer experience, whereas the e-KYC and OCR technologies enable automatization of the documentation verification process. Meanwhile, the use of AI in credit assessment is instrumental in evaluating financial and repayment capabilities. In addition, such technologies as predictive analytics can be integrated into the process of property valuation, whereas machine learning can be employed to detect fraudulent patterns. Finally, when it comes to loan servicing, the utilization of AI can support the process of engaging with customers via reminders and other services. Altogether, such examples are indicative of the extensive potential of AI in supporting various stages of the home loan life cycle.

Table 2: AI in Home Loan Life Cycle

Home Loan Stage	AI Application	Potential Benefit
Customer Enquiry	AI Chatbots & Virtual Assistants	Faster customer support
Customer Onboarding	e-KYC and OCR	Faster document verification
Credit Assessment	AI-based Credit Scoring	Support in lending decisions
Property Valuation	Predictive Analytics	Support in property valuation
Fraud Detection	Machine Learning	Identification of potential fraud
Loan Servicing	Predictive Analytics & CRM	Better customer engagement

Source: Author's compilation based on secondary sources [2], [7], [11], [12].

Interpretation : Altogether, Table 2 demonstrates that AI can be applied extensively in relation to home loan life cycle, ranging from customer inquiry to loan servicing. In this context, the utilization of AI

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

can be primarily seen in terms of automatization of routine processes, supporting roles in credit and risk assessment, fraud detection, and better engagement with customers. Thus, the benefits of embedding such technologies as predictive analytics and chatbots into the operations of banks and housing finance companies are compelling. Nevertheless, they can only be effectively realized if proper data management, human oversight, and ethical considerations are taken into account. **[7], [10], [11]**.

iii. Emerging Trends in AI-Enabled Home Loan Services: AI-enabled home loan services in India are slowly leaning towards automation and data driven lending. Some key trends are the use of predictive analytics for credit assessment, AI-based customer support, automated document processing and integration with Digital Public Infrastructure such as Aadhaar, Account Aggregator and the Unified Lending Interface (ULI). Additionally, there is a rising focus towards development of responsible and explainable AI to strengthen transparency and regulatory compliance. Some of these trends point towards the growing importance of AI for improving efficiency, risk management and customer experience in home loan services.

Table 3: Emerging Trends in AI-Enabled Home Loan Services

Emerging Trend	Potential Impact
AI-enabled Digital Lending	Faster and automated processing
Predictive Analytics	Support in credit assessment
AI Chatbots	Improved customer support
Account Aggregator and ULI	Improved data sharing
Responsible AI	Greater transparency and fairness

Source: Author's compilation based on secondary sources [2], [3], [5], [10], [13].

*Interpretation:*Table 3 suggests that emerging applications of AI in home loan services are making them more automated and data driven. Integration and use of Digital Public Infrastructure can help enable faster processing of information, while responsible AI practices are gaining importance for protecting transparency, fairness and customer rights. [2], [11]

iv. Opportunities of AI Adoption : Artificial Intelligence presents several growth opportunities for Indian home loan services. AI can improve credit assessment, automate processing and reduce operating costs, help in identifying fraudulent activities and enhance customer service. It can also contribute towards financial inclusion and digital transformation of housing finance.

Table 4: Major Opportunities of AI in Home Loan Services

Area	Major Opportunity
Credit Assessment	Faster and data-supported lending decisions
Loan Processing	Reduced manual work and processing time
Fraud Detection	Improved identification of potential fraud
Customer Service	Faster and 24×7 customer support
Risk Management	Better monitoring and assessment of risk
Financial Inclusion	Potential to improve access to housing finance

Source: Author's compilation based on secondary literature.[2], [11]

Interpretation: Table 4 demonstrates that AI provides growth opportunities in both operational and customer-centric areas of home loan services. Its major potential lies in improving processing efficiency, credit assessment and risk management, strengthening fraud detection and improving customer service. However, such benefits can be achieved only through responsible implementation, reliable data and appropriate human supervision.

v. Challenges and Risks of AI Adoption : Although AI adoption can bring numerous benefits to home loan service providers or customers, it is inevitably associated with several challenges and risks. [3], [5] First, the use of AI in the sector raises significant concerns regarding data privacy and cybersecurity issues. Moreover, there is a possibility of encountering algorithmic bias and a lack of transparency in automated decisions made by AI systems, which could lead to discriminatory lending practices. In addition, the accuracy of results delivered by AI is highly dependent on the quality of input data used for training algorithms. Thus, poor data quality poses a significant risk in the adoption process, and expensive technology and the absence of skilled personnel to manage it can become an obstacle for some firms. Finally, there is a need for regulation and proper ethical use of customer data, which adds to the complexity of the adoption process.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Table 5: Major Challenges of AI Adoption in Home Loan Services	
Challenge	**Possible Concern**
Data Privacy	Misuse or exposure of customer information
Cybersecurity	Risk of data breaches and cyber threats
Algorithmic Bias	Possibility of unfair lending decisions
Lack of Transparency	Difficulty in explaining AI-based decisions
Data Quality	Inaccurate or unreliable model outcomes
Implementation Cost	Higher technology and infrastructure costs
Regulatory Compliance	Need to meet legal and ethical requirements

Source: Author's compilation based on secondary information. [3], [5], [14]

Interpretation *:* Based on the information presented in Table 5 above, it can be concluded that most of the challenges and risks associated with AI adoption in the home loan sector are related to cybersecurity, data privacy, the ethical use of data, and regulatory compliance. Therefore, it is essential for firms to invest in proper cybersecurity infrastructure, ensure transparency and human oversight in AI decisions, and implement appropriate ethical guidelines to ensure that AI is used responsibly and ethically. [3], [5]

Future Outlook : The future of AI in India's home loan space is likely to be shaped by developments in generative AI, explainable AI, predictive analytics, and intelligent automation. Its convergence with the Digital Public Infrastructure including the Account Aggregator framework and the Unified Lending Interface could enable faster, data-driven lending processes. However, responsible AI governance, data security, transparency, and workforce skills will be critical for its sustainable adoption. [3], [5], [13]

Practical Implications

i. The banks and housing finance companies must embrace AI with suitable human intervention and explainability. [5]

ii. The banks and housing finance companies must focus on improving data quality, cybersecurity, and AI governance.

iii. The employees must be trained and upskilled for the effective adoption and use of AI.

iv. The regulators must promote innovation while ensuring fairness, transparency, data privacy, and consumer protection. [5]

Major findings of the study :

i. The application of artificial intelligence in the banking and lending industry is growing tremendously, and it is being applied in customer service, credit assessment, document processing, and fraud detection.

ii. Artificial intelligence can be integrated into various stages of the home loan process to improve and automate the procedure, including data collection, credit and risk assessment, fraud detection, and customer service.

iii. The main potential applications of artificial intelligence in the home loan process include processing speed, credit and risk assessment, fraud detection, and improved customer service.

iv. The main challenges of implementing artificial intelligence in the home loan process include data privacy, cyber security, algorithmic bias, transparency of algorithms, and data quality.

v. Artificial intelligence should be adopted in the home loan process with due care and attention to governance, human oversight, transparency, and consumer protection.

Conclusion

The study demonstrates that AI is poised to transform the home loan space in India through its applications in automating processes, evaluating creditworthiness, detecting fraud, and providing customer service. The banks and housing finance companies are witnessing the potential of AI in various phases of the lending cycle and are exploring its adoption aided by the emerging digital financial infrastructure.[5] While AI promises faster processing, better risk assessment, reduced manual intervention, and enhanced customer experience, the apprehensions around data privacy, cybersecurity, algorithmic bias, transparency, and regulatory compliance need to be addressed for its smooth adoption. Therefore, the future of AI in home loan space calls for a balance between technology and human intervention, automation and control, and efficiency and accountability. Further studies could explore the customer's perception of adopting AI in the home loan space and its impact on lending decisions and performance using primary data.

Acknowledgement

I would like to express my sincere gratitude to all those who contributed directly or indirectly to the successful completion of this research paper titled "Artificial Intelligence in Home Loan Services in India: An Analysis of Trends, Opportunities, and Challenges." I am deeply thankful to my academic institution, faculty members, and colleagues for their valuable guidance, encouragement, and support throughout the research process. Their constructive suggestions and academic insights

Abstract

India's Micro, Small and Medium Enterprises sector drives nearly a third of the country's Gross Value Added, yet as recently as 2015 almost 90% of these businesses had no access to formal credit. The Pradhan Mantri Mudra Yojana (PMMY), launched that year to fund this "unfunded" segment through collateral-free loans, has since grown into one of the world's largest micro-credit interventions — sanctioning over 52 crore loans worth more than ₹32–35 lakh crore in a decade. This study traces PMMY's policy design, its four-tier loan structure (Shishu, Kishore, Tarun, and the recently added Tarun Plus), and its performance from 2015-16 to 2024-25, drawing entirely on secondary data from official annual reports and peer-reviewed literature. The analysis finds a clear shift from micro-lending toward larger Kishore and Tarun loans, alongside strong inclusion of women (68–71% of accounts) and SC/ST/OBC borrowers (~50% of accounts). However, it also uncovers a persistent gap: these groups hold a disproportionate share of accounts relative to the credit value they actually receive, suggesting concentration in entry-level loans rather than genuine graduation to higher tiers.

Key words: *Pradhan Mantri Mudra Yojana (PMMY), Micro and Small Firms (MSEs), Financial Inclusion, Self-employment, Economic activity,Compound Annual Growth Rate (CAGR)*

Introduction

India's MSME sector is a key part of the economy. It contributes nearly 28–33% of Gross Value Added and employs about 11 crore people — the second-largest source of jobs after agriculture. Yet for years, most small businesses could not get bank loans. As of 2015, almost 90% of MSMEs had no access to formal credit, and the credit gap was estimated at ₹31–39 lakh crore. Reasons included no collateral, poor documentation, no credit history, and banks seeing micro-borrowers as risky. This pushed many small entrepreneurs toward informal moneylenders who charged high interest. To fix this, the government launched the **Pradhan Mantri Mudra Yojana (PMMY)** on April 8, 2015, under the Ministry of Finance, through MUDRA Ltd. Its goal was "funding the unfunded" — giving collateral-free loans to small, non-farm businesses. Loans are given in three stages based on business size: **Shishu** (up to ₹50,000), **Kishore** (₹50,001–₹5 lakh), and **Tarun** (₹5–10 lakh). After Budget 2024–25, a new **Tarun Plus** category was added, raising the limit to ₹20 lakh for repeat borrowers who repaid well. Banks, NBFCs, and MFIs give out these loans, and risk is shared through the Credit Guarantee Fund for Micro Units (CGFMU). This raises the first question: how was this system designed, and how has it changed over ten years? In ten years, PMMY has approved over 52 crore loans worth more than ₹32–35 lakh crore.

Women make up about 68–71% of borrowers, and SC/ST/OBC groups make up nearly 50% of accounts — making it one of India's most socially inclusive credit schemes. But this growth has a cost: NPAs (bad loans) have risen to almost 9.8% by FY25, mostly among first-time borrowers with no collateral. Loan distribution is also uneven — Tamil Nadu, Uttar Pradesh, and Karnataka get the highest loan amounts, while Bihar has the most accounts. This shows a gap between how many people get loans and how much money they actually receive. Beyond just credit numbers, PMMY also affects self-employment, MSME growth, and job creation — linking it to India's larger goals like Atmanirbhar Bharat and Viksit Bharat 2047. This study looks at the full ten-year period, from the scheme's start in 2015 up to the latest available data in 2025–26

Review of Literature

Ramesh and Prakash (2026) examined PMMY's theoretical foundations, framing the scheme through financial intermediation theory and information asymmetry reduction. Their analysis of the scheme's three-tiered structure (Shishu, Kishore, Tarun, and the 2024-introduced Tarun Plus category) highlighted how the Credit Guarantee Fund for Micro Units (CGFMU) and MUDRA refinance mechanisms function synergistically to reduce lenders' perceived default risk while improving funding accessibility for Member Lending Institutions. Sudhir et al. (2025) analyzed PMMY's implementation trends from 2016 to 2023 using percentage analysis across loan categories. Their findings indicated that while the Shishu category historically dominated by account volume, its share of new accounts declined from approximately 89% in FY2015-16 to around 72% by FY2021-22, with a corresponding rise in Kishore and Tarun disbursement value — evidence, the authors argued, of businesses "graduating" toward higher credit tiers over time. Koley (2025) corroborated this trend at a national level, reporting that Kishore loans rose from 5.9% of disbursement in FY2016 to 44.7% by FY2025, alongside a near-tripling of average loan size from ₹38,000 to ₹1.02 lakh over the same period. Ram and Sah (2026) provided the most detailed gender-focused analysis, documenting that women constituted 68–71% of PMMY beneficiaries, with cumulative disbursement to women exceeding ₹35 lakh crore by mid-2025. Their study noted a 13% CAGR in per-woman disbursement (reaching ₹62,679 by FY2025) and reported income increases of 20–50% among women borrowers, alongside qualitative gains in household decision-making and reduced dependence on moneylenders. However, the authors also found that women's loans remained concentrated in the Shishu category, with limited upward mobility to Kishore or Tarun tiers due to risk aversion and sector-specific constraints. Koley (2025) similarly reported that SC/ST/OBC borrowers comprised approximately 50% of accounts, with 11% belonging to minority communities, reinforcing PMMY's role in reaching historically underserved groups. Ramesh and Prakash (2026) identified a concerning asset-quality trend, noting that NPA accounts grew at a CAGR of 22.51% and NPA amounts at 36.61% between FY2017 and FY2022, though the overall NPA rate later declined from 3.61% (FY21) to 2.1% (FY24). Their institutional comparison found Public Sector Banks recorded the highest NPA rates (22.6% by account), while NBFCs and MFIs maintained substantially lower default rates (1.3% and low respectively), attributing this gap to superior risk-assessment capabilities among specialized lenders. Kumar (2023) reached a similar conclusion using government expenditure data, showing NPA percentages rising steadily from 2.5% (2015-16) to approximately 5.0% (2022-23) as government allocation to the scheme expanded, and cautioned that collateral-free lending inherently elevates default risk absent complementary borrower-monitoring mechanisms. Koley (2025) mapped state-wise disbursement as of February 2025, identifying Tamil Nadu (₹3.24 lakh crore), Uttar Pradesh (₹3.14 lakh crore), and Karnataka (₹3.02 lakh crore) as leading states by value. Sudhir et al. (2025) added a complementary account-volume perspective, noting that Eastern and North-Eastern states accounted for a disproportionately large share of loan counts even where Southern states led in loan value — a distinction the authors linked to differences in average ticket size across regions rather than differences in outreach effort. Ramesh and Prakash (2026) reported that loan recipients typically added 1–3 employees per enterprise, suggesting employment generation "numbering in tens of millions" across 52 crore beneficiaries, though they cautioned that rigorous quantification requires primary survey research beyond available secondary data. Koley (2025) situated this employment effect within a larger formalization narrative, citing SBI data showing MSME credit penetration rising from ₹8.51 lakh crore (FY2014) to ₹27.25 lakh crore (FY2024), and noted the IMF's repeated commendation (2017–2024) of PMMY's contribution to self-employment and economic diversification.

Objectives of the Study

- To study how the Pradhan Mantri Mudra Yojana (PMMY) was designed and set up —

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

including why it was launched, its loan categories (Shishu, Kishore, Tarun, and later Tarun Plus), and how loans are delivered to borrowers through MUDRA Ltd. .

- To analyze the scale and category-wise pattern of credit disbursement under PMMY from 2015 to 2025, using growth rate and CAGR analysis across the Shishu, Kishore, and Tarun categories.
- To assess PMMY's contribution to financial inclusion among women entrepreneurs and SC/ST/OBC communities.
- To understand PMMY's contribution to employment generation and MSME formalization, and its alignment with India's broader goals of Atmanirbhar Bharat and Viksit Bharat 2047.

Research Methodology

Research Design

This study adopts a descriptive and analytical research design, based entirely on secondary data, consistent with the methodology followed in comparable PMMY studies reviewed above. Data has been drawn from official government portals, ministry and RBI publications, international institution reports, and policy assessment studies and peer-reviewed academic journals.

Policy Formulation and Institutional Design

Since its launch on April 8, 2015, PMMY has operated through a structured, tiered lending architecture designed to match credit size with business maturity. The original three categories Shishu (up to ₹50,000), Kishore (₹50,001 to ₹5 lakh), and Tarun (₹5 lakh to ₹10 lakh) were expanded in October 2024 with the introduction of Tarun Plus (₹10 lakh to ₹20 lakh), reserved for entrepreneurs who had successfully repaid an earlier Tarun loan. This progressive structure reflects a deliberate policy design intended to reward repayment discipline rather than simply expanding credit ceilings uniformly. The delivery mechanism itself routed through Scheduled Commercial Banks, Regional Rural Banks, Small Finance Banks, NBFCs, and MFIs, and backed by the Credit Guarantee Fund for Micro Units (CGFMU) indicates that the scheme was formulated not as a direct-lending programme but as a risk-sharing and refinancing framework, shifting a portion of default risk away from individual lenders and thereby incentivizing outreach to previously unbanked micro-entrepreneurs.

Table 1: Total Accounts & Total Sanctioned Amount

Year	Total No. of A/Cs	Total Sanctioned Amt (₹ cr)
2015-16	3,48,80,924	1,37,449
2016-17	3,97,01,047	1,80,528.5
2017-18	4,81,30,593	2,53,677.10
2018-19	5,98,70,318	3,21,722.79
2019-20	6,22,47,606	3,37,496
2020-21	5,07,35,046	3,21,759
2021-22	5,37,95,526	3,39,110
2022-23	6,23,10,598	4,56,538
2023-24	6,67,77,013	5,41,013
2024-25	5,46,61,648	5,52,802

Source: PMMY: Annual Report from 2015 to 2025

It explain tracking the overall scale and growth of PMMY disbursement over the decade. Total sanctioned amount rose from ₹1,37,449 crore in 2015-16 to ₹5,52,802 crore in 2024-25, roughly a four-fold increase, demonstrating sustained expansion in the scheme's credit footprint. Account numbers, however, followed a less consistent path: rising steadily from 3.49 crore (2015-16) to a peak of 6.68 crore accounts in 2023-24, before falling to 5.47 crore in 2024-25 — even as the sanctioned amount that same year continued climbing to its decade-high. This divergence is the table's most important signal: when accounts fall but amount still rises, it means fewer new borrowers are being onboarded while existing or larger borrowers are absorbing bigger loans — early quantitative evidence of the "extensive versus intensive" growth pattern this study identifies elsewhere, where the loan book matures rather than simply widens. The 2020-21 dip in accounts (from 6.22 crore to 5.07 crore) visibly

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

captures the COVID-19 shock, and the scheme's swift return to growth by 2021-22 confirms its institutional resilience. Taken together, this table shows PMMY has moved from a rapid-onboarding phase toward a deepening-credit phase — precisely the kind of maturing, formally banked entrepreneurial base that the Viksit Bharat 2047 vision depends on to convert informal micro-enterprise into durable economic growth

2. Scale and Category-wise Disbursement Trends

The disbursement data reveals sustained, near-exponential growth over the decade. Loan sanctions rose from approximately ₹1.33 lakh crore in FY2015-16 to a cumulative ₹32–35 lakh crore by 2025, sanctioned across more than 52 crore loan accounts a scale that positions PMMY among the largest microfinance interventions globally. Growth was not linear: FY2020-21 saw a contraction of roughly 18% in disbursed accounts due to COVID-19 disruptions, followed by a strong post-pandemic rebound with a CAGR exceeding 20% between 2021 and 2023. More significant than the aggregate growth is the compositional shift within the portfolio. The Shishu category, which accounted for nearly 89% of new accounts at launch, gradually declined to around 72% by FY2021-22, while Kishore's share of disbursement rose from just 5.9% in FY2016 to 44.7% by FY2025. This shift indicates that PMMY has moved beyond serving only first-time, subsistence-level borrowers and is increasingly financing business expansion a trend corroborated by the near-tripling of average loan size, from ₹38,000 in FY2016 to approximately ₹1.02 lakh in FY2025.

Table 2: Category-wise Amount — Shishu, Kishor, Tarun (with Year-on-Year Difference)

Year	Shishu (₹ cr)	Kishor (₹ cr)	Tarun(₹ cr)
2015-16	62,027.69	41,073.28	29,853.76
2016-17	85,100	53545.14	41882.66
2017-18	1,06,001.6	86,732.15	60,943.36
2018-19	1,42,345.25	1,04,386.68	74,990.86
2019-20	1,63,559	95,579	78,358
2020-21	1,09,953	1,32,516	79,290
2021-22	1,24,747	1,37,644	76,719
2022-23	1,42,766	2,04,007	1,09,765
2023-24	1,48,937	2,62,285	1,29,791
2024-25	1,04,151	2,86,040	1,58,308

Source: PMMY: Annual Report for 2015 to 2025

Gender-disaggregated data confirms that PMMY has functioned as a substantial instrument of women's financial inclusion. Women have consistently constituted 68–71% of total beneficiary accounts, with a peak of 71% recorded in FY2022-23. However, a persistent gap exists between account share and disbursement share: while women hold roughly seven in ten accounts, they receive closer to 41–48% of total disbursement value, reflecting their concentration in smaller, Shishu-category loans. Per-woman disbursement has nonetheless grown at a healthy 13% CAGR, reaching approximately ₹62,679 by FY2025 — evidence of gradually increasing loan sizes even within a historically risk-averse borrower segment. A similar inclusion pattern holds for SC/ST/OBC borrowers, who represent approximately 50% of total accounts, though — mirroring the pattern among women — these borrowers remain disproportionately concentrated in the Shishu category (SC borrowers alone show over 83% concentration in Shishu), pointing to a common structural barrier in "graduating" disadvantaged groups to higher loan tiers regardless of gender or social category.

Year	Women A/Cs	Amount (₹ cr)	Share of Total Amount
2015-16	2,76,28,000	63,190	~47.5%
2018-19	3,70,62,562	1,33,033.62	41%
2019-20	3,91,03,349	1,45,182	43%
2020-21	3,33,03,604	1,31,303	41%
2021-22	3,84,29,259	1,66,422	49%
2022-23	4,42,56,813	2,16,954	47.52%
2023-24	4,24,92,281	2,25,887	41.75%
2024-25	3,26,93,129	2,08,234	37.67%

Table 3: Women Borrowers — Accounts & Amount

Source: PMMY: Annual Report for 2015 to 2025

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

This table is central to the study's third objective and presents a more dynamic — and more concerning — trajectory than the SC/ST/OBC data. Women's share of total disbursed or sanctioned amount rose from an already high ~47.5% in 2015-16 to a peak of 49% in 2021-22, before declining sharply to just 37.67% by 2024-25, the lowest point recorded across the observed decade. This decline closely parallels Shishu's shrinking share noted in Table 2, since Shishu loans — often channelled through microfinance institutions — are where women borrowers have historically been most concentrated. As PMMY's overall loan book shifts toward larger Kishor and Tarun credit, typically accessed by more established borrowers, women's proportional share contracts even as the absolute amount disbursed to them continues rising, from ₹63,190 crore in 2015-16 to a peak of ₹2,25,887 crore in 2023-24. This confirms a cross-cutting pattern identified throughout this study: PMMY has been considerably more effective at extending initial credit access to women than at supporting their graduation alongside the portfolio's broader shift toward larger, growth-stage loans. The recent decline is particularly notable given it occurs after several years of steady improvement, suggesting the gains are not yet structurally secure. Reversing this trend through targeted Kishor and Tarun graduation support for women borrowers is not merely a scheme-level adjustment but a necessary precondition for the inclusive, gender-equitable economic growth that the Viksit Bharat 2047 vision explicitly and repeatedly emphasizes

Table 3: Socially marginalized communities (SC + ST + OBC) — Accounts & Amount

Year	SC/ST/OBC A/Cs	Amount (₹ cr)	Share of Total Amount
2015-16	1,84,00,000	49,196.33	~37%
2018-19	2,81,35,095	1,01,593.64	~31.6%
2019-20	2,97,50,100	1,13,884	34%
2020-21	2,48,70,347	1,05,817	33%
2021-22	2,78,01,387	1,25,226	37%
2022-23	3,14,53,998	1,65,955	36.35%
2023-24	3,13,47,224	1,92,142	35.52%
2024-25	2,48,81,946	1,77,441	32.10%

Source: Source: PMMY: Annual Report for 2015 to 2025

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

This table speaks directly to the study's third objective, which assesses PMMY's contribution to financial inclusion among socially marginalized communities. The data shows that SC/ST/OBC borrowers' share of total sanctioned or disbursed amount has remained remarkably stable across the decade, oscillating narrowly between 31.6% (2018-19) and 37% (2015-16 and 2021-22), before settling at 32.10% in 2024-25. Rather than a continuously deepening trend, this stability suggests that PMMY's inclusion of backward-class borrowers reached a plateau relatively early, a finding that tempers the scheme's otherwise strong headline inclusion narrative. In absolute terms, disbursement to this group did grow substantially — from ₹49,196 crore in 2015-16 to a peak of ₹1,92,142 crore in 2023-24 — before declining alongside the broader 2024-25 slowdown in total accounts sanctioned. Importantly, this amount-share figure remains consistently lower than the roughly 50% account-share often cited in national PMMY reports for SC/ST/OBC borrowers, reinforcing a pattern identified elsewhere in this study: backward-class entrepreneurs hold a disproportionately large number of accounts relative to the loan value they actually receive, indicating continued concentration in smaller, Shishu-type credit rather than genuine graduation into higher loan tiers. Closing this persistent account-to-value gap is essential if PMMY's social inclusion achievements are to translate into meaningful economic mobility rather than symbolic representation. Ensuring that SC/ST/OBC entrepreneurs move beyond entry-level credit and into sustained business growth is precisely the kind of broad-based, socially equitable development that the Viksit Bharat 2047 vision requires at its foundation.

4. Employment Generation and MSME Formalization

While PMMY was not designed primarily as an employment scheme, its downstream effects on job creation and formalization appear substantial, if difficult to measure precisely. Survey-based estimates suggest that loan recipients typically add one to three employees per enterprise upon receiving credit — a modest per-unit figure that, scaled across 52 crore beneficiaries, implies potential employment generation in the tens of millions, though this remains an extrapolation rather than a directly measured outcome. At the macro level, the formalization effect is better documented: overall MSME credit in the banking system rose from ₹8.51 lakh crore in FY2014 to ₹27.25 lakh crore in FY2024, with MSME credit's share of total bank lending rising from under 16% to nearly 20% over the same period — a shift too large to attribute to PMMY alone, but one in which PMMY's collateral-free lending model appears to have played a catalytic role, a conclusion echoed in the IMF's repeated (2017–2024) commendation of the scheme's contribution to India's self-employment and financial-formalization agenda.

Government Initiatives and Policy Directions

1. Recent Loan Limit Revisions and the Tarun Plus Category

As PMMY entered its second decade, the government revised its credit structure to address inflation and the growing need for larger business loans. Following the Union Budget 2024–25, the maximum loan limit was increased from ₹10 lakh to ₹20 lakh, and a new Tarun Plus category (₹10,00,001 to ₹20,00,000) was introduced from October 2024.

Unlike the original three categories, Tarun Plus is available only to entrepreneurs who have successfully repaid a previous Tarun loan. This makes the new category more than just an increase in the loan limit; it creates a graduation pathway for borrowers who demonstrate good repayment behaviour.

The change also addresses the low participation in the Tarun category, which accounted for only 2.03% of loan accounts but over 23% of disbursement value. By allowing successful borrowers to access larger loans, PMMY now provides greater opportunities for businesses to expand and grow beyond the micro-enterprise level.

2. Convergence with Stand-Up India

PMMY does not operate in isolation but forms part of a layered ecosystem of government credit schemes targeting different segments of the entrepreneurial pyramid. The Stand-Up India Scheme, launched in April 2016, specifically targets Scheduled Caste,

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Scheduled Tribe, and women entrepreneurs, offering bank loans between ₹10 lakh and ₹1 crore for greenfield enterprises — a loan range that begins almost exactly where PMMY's Tarun (and now Tarun Plus) ceiling ends. This positions Stand-Up India as a natural graduation channel for successful PMMY borrowers, particularly women and SC/ST entrepreneurs, who — as the data analysis showed — remain disproportionately concentrated in the Shishu and Kishore categories. Policy convergence between the two schemes is therefore not merely complementary but structurally necessary: without an accessible bridge from PMMY's ₹20 lakh ceiling to Stand-Up India's ₹10 lakh–₹1 crore band, borrowers seeking to scale beyond micro-enterprise status face a credit gap precisely at the point where they are most creditworthy.

3. Institutional and Digital Reforms

Recent policy direction has also emphasized institutional strengthening: UPI-linked RuPay credit cards for beneficiaries, e-KYC standardization using Udyam registration and Aadhaar-based verification to reduce documentation barriers, and proposals for AI-enabled monitoring of Non-Performing Assets to catch early default signals — particularly relevant given the elevated NPA rates observed in the Shishu segment of public-sector banks documented in the data analysis above.

Findings of the Study

1. Policy Formulation and Institutional Design

- PMMY was formulated as a refinancing and risk-sharing framework rather than a direct-lending scheme, channeling credit through diverse Member Lending Institutions rather than disbursing loans itself.
- The scheme's progressive four-tier structure (Shishu, Kishore, Tarun, Tarun Plus) reflects a deliberate design shift from simple credit provision toward rewarding repayment discipline with graduated access to larger capital.
- The Credit Guarantee Fund for Micro Units (CGFMU) has been central to the scheme's viability, reducing lender risk perception sufficiently to sustain collateral-free lending at scale.

2. Scale and Category-wise Disbursement

- PMMY has achieved transformative scale, with over 52 crore loans sanctioned worth more than ₹32–35 lakh crore within a decade — a CAGR of roughly 16–18% in accounts and sanctioned amount.
- A clear compositional shift has occurred from micro (Shishu) to small (Kishore) enterprise lending, with Kishore's disbursement share rising from 5.9% (FY2016) to 44.7% (FY2025).
- Average loan size nearly tripled over the decade (₹38,000 to ₹1.02 lakh), indicating deepening credit use rather than purely expanding borrower numbers.
- The scheme demonstrated resilience through the COVID-19 shock, with an 18% contraction in FY2020-21 followed by a post-pandemic CAGR exceeding 20%.

3. Financial Inclusion Among Women and Marginalized Communities

- Women have consistently held 68–71% of PMMY accounts, making the scheme one of the largest instruments of women's economic inclusion globally.
- A persistent account-share-to-disbursement-share gap exists: women hold ~70% of accounts but receive only 41–48% of disbursement value, reflecting concentration in smaller loans.
- SC/ST/OBC borrowers constitute approximately 50% of accounts, but like women, remain disproportionately concentrated in the Shishu category, indicating a shared structural barrier to loan-tier graduation across disadvantaged groups.

6. Employment Generation and MSME Formalization

- PMMY appears to have contributed meaningfully to formalization, with overall MSME credit in the banking system rising from ₹8.51 lakh crore (FY2014) to ₹27.25 lakh crore (FY2024).
- Employment effects (estimated at 1–3 jobs per enterprise) remain directionally positive but are based on survey extrapolation rather than direct

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

measurement — a genuine evidentiary gap.

- International assessment (IMF, 2017–2024) has repeatedly credited PMMY with advancing self-employment and financial formalization, reinforcing its relevance to Atmanirbhar Bharat and Viksit Bharat 2047.

Suggestions

1. On Policy Formulation and Institutional Design

- The CGFMU guarantee structure should be periodically reviewed and its payout ceiling recalibrated, since a guarantee cover perceived as inadequate by lenders can discourage aggressive PMMY participation despite the scheme's collateral-free mandate.
- Institutional diversity should be actively encouraged — given that NBFCs and MFIs have demonstrated superior risk-assessment outcomes, differentiated refinance incentives could be extended to draw these institutions into a larger share of PMMY lending, rather than leaving disbursement concentrated in Public Sector Banks.

2. On Scale and Category-wise Disbursement

- Given the cross-cutting finding that growth has been "extensive over intensive," policy focus should shift from further widening the borrower base toward deepening credit access for existing borrowers — specifically, structured pathways to help Shishu borrowers graduate to Kishore, and Kishore borrowers to Tarun/Tarun Plus.
- A digital "credit growth ladder" — tracking individual borrower repayment history and automatically flagging eligibility for the next loan tier — could formalize this graduation pathway rather than leaving it to borrower initiative alone.

3. On Financial Inclusion Among Women and Marginalized Communities

- Since women and SC/ST/OBC borrowers share a common pattern of Shishu-category concentration, graduation incentives should be paired with sector-specific skilling and market-linkage support (e.g., integration with PMKVY, ONDC, and GeM), rather than credit access alone, to address the underlying risk-aversion and market-access barriers documented in the literature.
- Gender-disaggregated and caste-disaggregated NPA and graduation data should be published at regular intervals to allow continuous monitoring of whether inclusion gains are translating into loan-tier progression, not just account numbers.

4. On Employment Generation and MSME Formalization

- The current reliance on survey-based employment extrapolation is a genuine evidentiary gap; a dedicated, PMMY-linked beneficiary-tracking system — capturing post-loan employment, income, and business survival data — would allow evidence-based rather than estimated claims about job creation.
- Convergence with Stand-Up India and Start-Up India should be formalized through structured referral mechanisms, so that PMMY borrowers who successfully graduate beyond the ₹20 lakh Tarun Plus ceiling have a clear, non-disruptive pathway into higher-value credit schemes rather than facing a financing gap at the point of greatest business momentum.

Conclusion

The Pradhan Mantri Mudra Yojana has evolved over a decade from a collateral-free micro-credit scheme into one of the world's largest financial inclusion interventions, sanctioning over 52 crore loans worth ₹32–35 lakh crore. This study traced the scheme's policy formulation and tiered institutional design, analyzed a decade of disbursement trends showing a clear shift from Shishu-dominated micro-lending toward larger Kishore and Tarun loans, and evaluated its substantial contribution to financial inclusion among women (68–71% of accounts) and SC/ST/OBC communities (~50% of accounts). At the same time, the analysis revealed persistent challenges — rising then moderating NPAs concentrated in the Kishore segment and Public Sector Banks, regional disparities between loan volume and loan value, and a recurring pattern of borrowers

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

remaining confined to lower loan tiers despite a decade of scheme maturity. Recent reforms, including the ₹20 lakh ceiling, the Tarun Plus category, and convergence with Stand-Up India and Start-Up India, represent meaningful steps toward addressing this "extensive over intensive" growth pattern, though employment-generation impacts remain estimated rather than rigorously measured. Overall, PMMY has succeeded in widening formal credit access for India's informal micro-enterprise sector, and its continued evolution — toward deeper credit graduation, stronger asset-quality monitoring, and closer scheme convergence — will remain central to India's broader vision of inclusive growth under Atmanirbhar Bharat and Viksit Bharat 2047.

Acknowledgement

The authors would like to express their sincere gratitude to all those who contributed directly or indirectly to the successful completion of this research study titled "Financial Inclusion by Design: A Policy Analysis of MUDRA Yojana's Formulation, Implementation, and Outcomes." The authors are grateful to KES' Shroff College of Arts and Commerce (Autonomous) for providing the academic environment and institutional support necessary for undertaking this research. They also extend their sincere appreciation to the various government institutions and official sources, particularly MUDRA Ltd., whose annual reports and published data served as important sources for analysing the formulation, implementation, credit disbursement trends, financial inclusion, and outcomes of the Pradhan Mantri Mudra Yojana (PMMY).

Abstract

The vision of Viksit Bharat @2047 represents India's aspiration to become a developed, inclusive, self-reliant and globally influential nation by the centenary of its independence. Sports and sportspersons can play a significant role in achieving this vision because sports are not merely a source of entertainment or international medals; they are powerful instruments for human development, health, discipline, social inclusion, employment generation, economic growth and national identity. India possesses one of the world's largest youth populations, creating a substantial demographic opportunity that can be transformed through systematic investment in physical education, sports participation, talent identification, sports science and athlete development. The Khelo Bharat Niti–2025 explicitly recognizes sports as an instrument of nation building and holistic development. Recent initiatives, including the Khelo India Mission announced in Union Budget 2026–27, further indicate a shift towards a long-term and outcome-oriented sports ecosystem. This paper examines the multidimensional contribution of sports and sportspersons to the vision of Viksit Bharat @2047. It discusses sporting excellence, youth empowerment, health, employment, sports economy, women's participation, rural talent, inclusion, sports science and technology, national pride and India's global soft power. The paper also identifies major challenges and proposes strategic measures for developing a sustainable, inclusive and globally competitive sporting ecosystem by 2047.

Keywords: *Viksit Bharat 2047, Sports, Sportspersons, Youth Empowerment, Nation Building, Khelo India, Sports Science, Sports Economy, Talent Development, Physical Education*

Introduction

India's journey towards Viksit Bharat @2047 requires development not only in economic and technological sectors but also in human capabilities, health, social cohesion and national confidence. In this context, sports can become an important pillar of national development. A strong sporting culture produces physically fit citizens, disciplined youth, skilled professionals, successful athletes and a sense of collective identity. The Government of India's Khelo Bharat Niti–2025 recognizes the transformative power of sports in nation building and holistic development. Its vision is based on using sports to promote excellence, economic development, social progress, health and well-being. The policy also seeks to create a sporting ecosystem that develops talent from grassroots participation to the international level. The importance of youth in this process is particularly significant. Sports provide an effective platform through which young people can develop leadership, teamwork, discipline, resilience, confidence and responsibility.

Therefore, the contribution of sports to Viksit Bharat should be understood through a broad framework: Fit Citizen → Skilled Youth → Sporting Excellence → Employment → Economic Growth → Social Development → National Pride → Global Recognition.

Sports as an Instrument of Nation Building

Sports have a unique capacity to bring people together irrespective of language, region, caste, gender, economic status or cultural background. A successful athlete representing India becomes a symbol of national unity and collective aspiration. International sporting events provide opportunities for India to demonstrate its organizational capacity, sporting talent and cultural identity before the global community. Sporting success also creates positive psychological effects among young people. Athletes such as Neeraj Chopra, P. V. Sindhu, Mary Kom, Abhinav Bindra, Saina Nehwal, Manu Bhaker and Avani Lekhara, among many others, have demonstrated how sporting achievements can inspire millions of young Indians. However, nation building through sports should not be measured only by medals. The larger objective is to develop a society in which participation in physical activity becomes a normal part of everyday life.

Youth Empowerment through Sports

India's demographic structure provides a major opportunity for Viksit Bharat. Sports can convert demographic potential into productive human capital. Participation in sports develops discipline and time management, leadership and decision-making, teamwork and cooperation, emotional resilience, goal setting, competitive spirit, responsibility and self-confidence. These competencies are valuable not only in sport but also in education, employment, entrepreneurship and public life. Sports should therefore be integrated with the broader national strategy for youth development.

Contribution of Sportspersons to Viksit Bharat

Sportspersons are important national assets because their influence extends beyond the playing field. Successful athletes act as role models and ambassadors of discipline, perseverance and national confidence.

First, sporting contribution: Athletes enhance India's performance at the Olympic, Paralympic, Asian, Commonwealth and other international competitions. Second, inspirational contribution: Successful athletes encourage children and young people to participate in sports and adopt healthier lifestyles. Third, social contribution: Sportspersons can promote gender equality, disability inclusion, education, fitness and social responsibility. Fourth, global contribution: International sporting achievements strengthen India's soft power and contribute to its image as a confident and capable nation. Therefore, the sportsperson of Viksit Bharat should be viewed not simply as a medal winner but as a national role model, youth influencer and social change agent.

Sports, Employment and Economic Development

The sports sector has developed into a broad economic ecosystem. Employment opportunities are no longer restricted to athletes. The sector requires coaches, physical education teachers, sports scientists, physiotherapists, sports psychologists, nutritionists, strength and conditioning specialists, referees, administrators, event managers, sports journalists, broadcasters, analysts, equipment manufacturers and sports entrepreneurs. The Union Budget 2026–27 announced the Khelo India Mission as a long-term initiative for transforming the sports sector. It also proposed a dedicated initiative for sports goods manufacturing with an allocation of ₹500 crore. Manufacturing of sports equipment, sports tourism, professional leagues, fitness services, digital sports platforms and sports education can generate employment and entrepreneurship opportunities. By 2047, India can aim to become not only a major sporting nation but also a global centre for sports manufacturing, sports technology, sports education and sports services.

Women and Inclusive Sports Development

Women sportspersons have made an important contribution to India's sporting identity. Their achievements have challenged traditional gender stereotypes and demonstrated that women can achieve excellence at the highest international level. For Viksit Bharat, women's participation in sports must expand from elite competition to grassroots participation. Schools, colleges, universities and communities should provide safe and accessible facilities for girls and women. Similarly, persons with disabilities should receive equal opportunities in sports. India's achievements in the Paralympic movement demonstrate the potential of inclusive sports development.

Rural Talent and Grassroots Development

India's sporting future depends heavily on identifying talent beyond major cities. Rural India contains enormous sporting potential, but many talented children lack access to quality coaching, equipment, nutrition, sports medicine and competition opportunities. A strong grassroots system should establish a pathway: School → Block → District → State → University → National → International. Talent identification should be

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

supported by scientific testing, digital databases and regular competitions. For Viksit Bharat @2047, every talented child should have the opportunity to progress irrespective of geographical or economic background.

Role of Sports Science and Technology

Modern international sport is increasingly dependent on scientific knowledge. Athlete performance is influenced by biomechanics, exercise physiology, sports psychology, nutrition, recovery science, injury prevention and data analytics. India therefore needs stronger integration between universities, sports institutions and high-performance centres. Physical education departments can become important centres for research and innovation.

Artificial intelligence, wearable devices, video analysis, performance tracking, virtual coaching and sports analytics can further improve athlete development. Investment in sports science will also generate employment for highly skilled professionals and strengthen India's academic contribution to global sports research.

Sports, Health and a Fit India

A developed nation requires a healthy population. Sedentary lifestyles, physical inactivity and lifestyle-related health problems can negatively affect productivity and quality of life. Sports and physical activity can contribute to preventive health by encouraging regular exercise, fitness and healthy lifestyles. Schools and universities therefore need to treat physical education as an essential component of education rather than an optional activity. The long-term objective should be to create a Sporting India, where every citizen participates in some form of physical activity while talented individuals receive specialized pathways for competitive sport.

10. Challenges to Sporting Development

Despite considerable progress, India faces several challenges:

1. Unequal access to quality sports infrastructure.
2. Shortage of scientifically trained coaches.
3. Inadequate sports science support at grassroots levels.
4. Financial constraints for talented athletes.
5. Insufficient integration between education and sports.
6. Limited opportunities for women in some regions.
7. Unequal access for persons with disabilities.
8. Inadequate sports research and data systems.
9. Shortage of qualified sports professionals.
10. Need for stronger governance, transparency and athlete welfare.

Addressing these challenges is essential for transforming sporting potential into sustainable excellence.

Strategic Roadmap for Sports in Viksit Bharat @2047

India should adopt a long-term Sports Vision 2047 based on five principles. First – Universal Participation: Every child should have access to physical education and basic sporting opportunities. Second – Talent Identification: Scientific talent identification should begin at an early age and extend to rural, tribal and economically disadvantaged communities. Third – High Performance: Elite athletes should receive integrated support involving coaching, nutrition, sports medicine, psychology, biomechanics and technology. Fourth – Sports Economy: India should strengthen sports manufacturing, sports tourism, professional leagues, sports education and entrepreneurship. Fifth – Human-Centred Development: Athlete welfare, education, career transition and mental well-being should remain central to the sporting system.

Conclusion

The vision of Viksit Bharat @2047 cannot be achieved only through economic growth, infrastructure and technology. It requires healthy, disciplined, skilled, confident and socially responsible citizens. Sports can contribute to all these dimensions simultaneously. Sportspersons are therefore not merely medal winners; they are ambassadors of national identity, sources of inspiration and catalysts for youth development. A successful sporting ecosystem can generate employment, promote health, strengthen social inclusion, encourage innovation and enhance India's international reputation. By 2047, India should aspire to become not only a nation of Olympic and Paralympic champions but also a healthy, active, inclusive and scientifically advanced sporting society. The real success of Viksit Bharat in sports will ultimately be measured not only by the number of medals India wins, but by the number of citizens whose lives are improved through sports.

Abstract

Artificial Intelligence (AI) is becoming an important technology in the field of Geography. It helps geographers collect, process, analyze, and interpret large amounts of geographical data quickly and accurately. AI is widely used with Geographic Information Systems (GIS), Remote Sensing, satellite images, GPS, and spatial databases. It can help in land-use and land-cover mapping, urban planning, population analysis, disaster management, climate studies, agriculture, and environmental monitoring. AI-based techniques such as machine learning and deep learning can identify patterns and changes in geographical areas that may be difficult to detect through traditional methods. AI also helps in predicting natural hazards such as floods, droughts, landslides, and forest fires. In urban areas, it supports transportation planning, infrastructure development, and smart-city management. In agriculture, AI can assist in crop monitoring, soil analysis, and yield prediction. However, the effective use of AI requires reliable data, skilled users, proper technology, and attention to data privacy and accuracy. Thus, Artificial Intelligence has great potential to improve geographical research, spatial analysis, planning, and sustainable development.

Keyword: *Artificial Intelligence (AI) ,Geographic Information System (GIS) ,Remote Sensing ,Machine Learning ,Deep Learning ,Spatial Analysis ,Geographical Data ,Urban Planning ,Sustainable Development.*

Introduction

Artificial Intelligence (AI) is an important modern technology used in geographical studies.It helps geographers collect, process, and analyze large amounts of geographical data.AI is widely used with Geographic Information Systems (GIS) and Remote Sensing.It helps in analyzing satellite images and aerial photographs accurately. AI can identify changes in land use and land cover over time. Machine learning helps in finding patterns and relationships in geographical data. AI is useful for urban planning and the development of smart cities. It supports transportation planning and traffic management in urban areas.AI helps in monitoring natural resources such as forests, water, and agricultural land. It can assist in predicting floods, droughts, landslides, and other natural hazards.In agriculture, AI is used for crop monitoring, soil analysis, and yield prediction. AI supports environmental monitoring and helps identify changes in ecosystems.It can improve the accuracy and speed of spatial analysis and geographical mapping.AI provides useful information for planning, decision-making, and sustainable development. Therefore, AI has great potential to make geographical research and planning more efficient and effective.

Objectives

Following are the main objectives of the study

1. To study Present condition Artificial Intelligence in Geography.
2. To study in the Future Artificial Intelligence in Geography.

Database And Methodology

The present study based on only secondary data. Reference books, Internet, Many other books.

Importance of Artificial Intelligence Use In Geography

1. **Better Geographical Data Analysis**

AI helps geographers process large amounts of geographical data quickly.It identifies patterns, relationships, and changes that may be difficult to find manually.This improves the quality of geographical analysis.

2. Improved GIS Applications

AI increases the efficiency of Geographic Information Systems (GIS).It helps in spatial analysis, mapping, classification, and decision-making.AI-supported GIS is useful for planning and resource management.

3. Remote Sensing and Satellite Image Analysis

AI can analyze satellite images and aerial photographs efficiently.It helps identify changes in land use, vegetation, water bodies, and settlements.This makes remote sensing studies faster and more accurate.

4. Urban and Regional Planning

AI helps planners understand population growth, urban expansion, and land-use changes. It supports the planning of roads, housing, public facilities, and infrastructure. This contributes to better and more organized urban development.

5. **Disaster Management**

6. AI can help identify areas that are at risk from floods, droughts, landslides, and other hazards.It can analyze data and support early-warning systems.This helps authorities prepare better disaster-management plans.

7. Agricultural Development

8. AI is useful for monitoring crops, soil conditions, rainfall, and agricultural land.It can help predict crop yields and identify areas affected by drought or other problems.This supports efficient and sustainable agricultural planning.

7. Environmental Monitoring

AI helps monitor forests, water resources, pollution, and changes in ecosystems.It can detect environmental changes from satellite and geographical data.This information supports environmental conservation and management.

9. Climate Change Studies

10. AI can analyze large climate datasets and identify long-term patterns. It helps researchers study changes in temperature, rainfall, and other climatic conditions. AI can also support climate-related predictions and planning.

9. Natural Resource Management

AI helps in the effective management of land, water, forests, and other natural resources. It can identify areas of resource availability and areas requiring protection.This promotes sustainable use of natural resources.

11. Support for Decision-Making

12. AI provides useful information for geographical planning and policy-making.It helps decision-makers compare different situations and predict possible outcomes.Therefore, AI can make geographical planning faster, more informed, and effective.

Present Condition of Artificial Intelligence Use in Geography

1. **Growing Use of AI in Geography**
2. Artificial Intelligence is increasingly being used in geographical research and education. It helps geographers analyze large and complex datasets. AI is becoming an important tool along with GIS and Remote Sensing.
3. **AI and Geographic Information Systems (GIS)**
4. AI is being integrated with GIS for spatial analysis and mapping. It helps identify geographical patterns and relationships. This makes GIS-based research faster and more efficient.
5. **Satellite Image Analysis**
6. AI is widely used to analyze satellite images and aerial photographs. It can identify land-use and land-cover changes, vegetation, water bodies, and urban areas. This reduces the time required for image interpretation.
7. **Urban Planning**
8. AI is increasingly used for studying urban growth and land-use changes. It supports planning of roads, housing, transport, and public facilities. AI can also contribute to smart-city planning.
9. **Disaster Management**
10. AI is being used to assess risks related to floods, droughts, landslides, and other natural hazards. It can analyze environmental and spatial data to identify vulnerable areas. This supports disaster preparedness and planning.
11. **Agricultural Geography**
12. AI is helping in crop monitoring, soil analysis, irrigation planning, and yield prediction. Satellite and field data can be analyzed to understand agricultural conditions. This supports more efficient agricultural planning.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

13. **Environmental Monitoring**
14. AI is used to monitor forests, water resources, pollution, and ecosystems. It can detect environmental changes from satellite and sensor data. This is useful for conservation and sustainable resource management.
15. **Climate Change Research**
16. AI is increasingly applied to climate and weather-related geographical studies. It helps researchers analyze large datasets and identify climatic patterns. It can support the study of temperature, rainfall, and environmental changes.
17. **Transport and Traffic Management**
18. AI is being used to study traffic patterns, transportation networks, and travel behaviour. It can help identify congestion and improve route planning. This is particularly useful in rapidly growing cities.
19. **Land-Use and Land-Cover Mapping**
20. AI-based machine learning and deep learning methods are increasingly used for land-use classification. They can classify satellite images into categories such as agriculture, forest, settlement, and water bodies. This improves the efficiency of land-use studies.
21. **Use of Machine Learning and Deep Learning**
22. Machine learning and deep learning are becoming important techniques in geographical research. They can recognize patterns in spatial and temporal data. These methods are useful for prediction and classification.
23. **Real-Time Geographical Data**
24. AI can process data collected from GPS, sensors, satellites, and other digital sources. Real-time information can support monitoring of traffic, weather, disasters, and environmental conditions. This improves timely decision-making.
25. **Development of Smart Cities**
26. AI is playing a growing role in smart-city development. It supports the management of transport, energy, water, waste, and urban infrastructure. Geographic data helps cities make better planning decisions.
27. **Challenges in AI Applications**
28. Despite its benefits, AI use in Geography faces challenges such as data quality, technical skills, high computing requirements, and privacy concerns. Incorrect or incomplete data can affect AI results. Therefore, human knowledge and verification remain important.
29. **Future Scope of AI in Geography**
30. The use of AI in Geography is expected to increase with advances in GIS, Remote Sensing, satellite technology, and computing. AI can provide new opportunities for geographical research and planning. Its responsible use can support sustainable development and better management of geographical resources.

Future of Artificial Intelligence Use in Geography

1. **Advanced Geographical Data Analysis**
2. In the future, AI will help geographers analyze very large and complex geographical datasets. It will identify patterns and relationships more quickly and accurately. This will improve geographical research and planning.
3. **Smart GIS and Mapping**
4. AI will make GIS more intelligent and automated. It will help create, update, and analyze maps with less manual work. Smart GIS can support better decisions in regional and urban planning.
5. **Improved Remote Sensing**
6. AI will provide better analysis of satellite images and aerial photographs. It will help detect changes in land use, vegetation, water resources, and settlements. This will make remote sensing more useful for geographical studies.
7. **Future Urban Planning**
8. AI can help predict future urban growth and population changes. It may support planning for roads, housing, transport, and public facilities. This can contribute to better and more sustainable cities.
9. **Disaster Prediction and Management**
10. AI can improve the prediction and monitoring of floods, droughts, landslides, and other natural hazards. It can identify vulnerable areas using geographical and environmental data. This will help improve disaster preparedness.
11. **Climate Change Studies**
12. AI will help researchers understand future climate patterns and environmental changes. It can analyze temperature, rainfall, and other climate data. This information can support climate adaptation and planning.
13. **Smart Agriculture**
14. AI can support future agricultural planning through crop monitoring, soil analysis, and yield prediction. It can help identify areas

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

requiring water or other resources. This can promote efficient and sustainable agriculture.

15. **Environmental Conservation**
16. AI will help monitor forests, wildlife habitats, water resources, and ecosystems. It can detect environmental changes at an early stage. This will support conservation and sustainable resource management.
17. **Better Transportation Planning**
18. AI can analyze traffic patterns and transportation networks in real time. It can help improve routes, reduce congestion, and support public transportation planning. This will be especially useful in growing cities.
19. **Sustainable Regional Development**
20. AI can help planners compare different development options and understand their possible impacts. It can support balanced use of land and natural resources. Therefore, AI may become an important tool for sustainable regional development.

Conclusion:

The future use of Artificial Intelligence in Geography is very promising. The combination of AI with GIS, Remote Sensing, GPS, satellite technology, and big data can make geographical research faster and more accurate. However, responsible use, reliable data, human supervision, and proper training will remain important.

Acknowledgement

I would like to express my sincere gratitude to all those who have supported and encouraged me in completing this research paper entitled "Uses of Artificial Intelligence in Geography." The study examines the growing importance of Artificial Intelligence in geographical research, particularly its applications in GIS, Remote Sensing, spatial analysis, urban planning, disaster management, agriculture, environmental monitoring, and sustainable development. I am deeply thankful to the authors, researchers, institutions, and publishers whose books, research works, and other secondary sources have contributed valuable knowledge and information to this study.

Abstract:

Artificial Intelligence is reshaping how societies function, communicate, learn and innovate, and India stands at a particularly consequential point in this shift. The arrival of generative AI, adaptive learning platforms and intelligent digital tools presents the country with both a rare opportunity and a demanding policy challenge on its path toward Viksit Bharat @2047. Education sits at the heart of this challenge, because the citizens, workers and innovators who will carry that vision forward are being shaped right now, inside today's classrooms. This conceptual paper asks how Artificial Intelligence can genuinely strengthen India's education system without eroding the human qualities that make learning meaningful: agency, creativity, ethics and social responsibility. Drawing on an integrative reading of policy documents and international literature - UNESCO's AI competency frameworks, OECD perspectives on AI literacy, India's National Education Policy 2020, the IndiaAI Mission, the World Economic Forum's Future of Jobs Report 2025, ILO research on generative AI and employment, and the author's own practitioner book AI and Us - the paper argues that the real question is not whether AI will replace teachers, but whether schools can build a working partnership between teachers, learners and AI. The paper introduces a Human-Centered AI Education Framework built around six interlocking dimensions: AI Literacy, AI-Augmented Pedagogy, Human Skills, Ethical and Responsible Use, Inclusive Digital Infrastructure, and Continuous Professional Learning. It also sketches a Teacher-AI-Student ecosystem in which AI takes on assistive and analytical work while teachers hold on to pedagogical, relational and ethical authority. Viksit Bharat @2047, the paper contends, does not just need citizens who are skilled at using AI - it needs citizens who are AI-literate, critical, creative, ethical and socially engaged. The paper closes with policy recommendations aimed at schools, teacher-education institutions, government bodies and educational technology developers.

Keywords: *Artificial Intelligence, AI in Education, Viksit Bharat @2047, AI Literacy, Teacher Competency, Human-AI Collaboration, NEP 2020, Future Skills, Digital Education, Ethical AI*

Introduction:

Viksit Bharat @2047 is not just an economic target - it is a wide-ranging national undertaking that touches knowledge, innovation, technology, inclusion, sustainability, human development and India's standing in the world. The International Conference on Viksit Bharat @2047: Empowering India's Digital Future through Artificial Intelligence, Digital Economy, Commerce, Innovation, and Sustainable Development names Artificial Intelligence, digital transformation, future work, innovation, skill-building, ethical AI and sustainable development as central areas needing sustained, cross-disciplinary attention. Education underpins all of these. No country becomes technologically advanced without citizens capable of understanding, questioning and responsibly applying technology.

Quick Response Code:

Website: https://bnir.us

AI, then, is not just one more gadget entering the classroom - it is beginning to reshape what counts as knowledge, how learning is assessed, how creativity is expressed, and how people and machines interact at work and in daily life. The stakes have grown sharper since generative AI systems became widely accessible. Teachers now have help with lesson planning, question design, translation and building differentiated content. Students can turn to AI for explanations, revision support, brainstorming, language help, coding and project work. The author's own practitioner book, AI and Us, frames these possibilities in similar terms - describing AI as a digital assistant for teachers and a learning partner for students, never a replacement for human judgment. The book walks through lesson planning, assessment, worksheet design, presentations, translation and personalized learning as concrete areas where AI can lighten a teacher's load. Yet capability is not the same as progress. AI systems can produce false information, replicate bias, compromise privacy, enable deepfakes and quietly encourage over-reliance. The author's book flags privacy, bias, fabricated content, disruption to jobs, dependency and accountability as the ethical questions that matter most. UNESCO makes a parallel point: generative AI in education needs a human-centered approach, real protection of data privacy, age-appropriate design and careful ethical review. Out of this tension comes the paper's central question: how can India bring AI into its schools in a way that genuinely improves learning and productivity, without weakening human agency, creativity, equity, ethics or the social role teachers play? This paper takes up that question directly, framed against the backdrop of Viksit Bharat @2047.

Rationale of the Study

Three shifts, happening at once, motivate this study. The first is a shift in what counts as knowledge. Students now have instant access to explanations, summaries, translations, simulations and generative tools, which means the teacher is no longer the sole gateway to information. The second is a shift in the nature of work. The World Economic Forum's Future of Jobs Report 2025 places AI and big data, networking and cybersecurity, and general technological literacy among the fastest-growing skill categories - while analytical thinking, creativity, resilience, adaptability, leadership, collaboration and lifelong learning remain just as important as ever. The third is a shift in teaching itself. UNESCO's AI Competency Framework for Teachers describes a move away from the traditional teacher-student relationship toward a teacher-AI-student dynamic, built around five competency areas: a human-centered mindset, ethics of AI, AI foundations and applications, AI pedagogy, and AI for professional learning. The question facing Indian education, then, is no longer whether to prepare for AI. It is what kind of education system India needs to build for an AI-shaped future.

Objectives of the Study:

1. Examine the emerging role of Artificial Intelligence within school education.
2. Analyze how teachers' roles and required competencies are changing in AI-enabled classrooms.
3. Identify the opportunities and risks that come with adopting AI in education.
4. Explore how AI literacy connects to future-ready skills.
5. Develop a human-centered framework for bringing AI into Indian education.
6. Connect AI-enabled education to the broader vision of Viksit Bharat @2047.
7. Offer policy and institutional recommendations for responsible, inclusive and sustainable AI adoption.

Research Questions

- RQ1: How can AI support teaching and learning without displacing the essential human role of the teacher?
- RQ2: What competencies will teachers and students need in an AI-enabled learning environment?
- RQ3: What ethical, social and infrastructural risks could limit equitable AI adoption in Indian schools?
- RQ4: What model of human-AI collaboration can meaningfully advance Viksit Bharat @2047?
- RQ5: What policy steps are needed to build an inclusive, future-ready AI education ecosystem?

Research Methodology:

This study follows a conceptual, integrative literature-review approach. It does not draw on primary survey data or invented empirical findings; instead, it synthesizes policy documents, international frameworks, institutional reports and practitioner writing relevant to AI and education.

The principal sources consulted include:

- UNESCO's Guidance for Generative AI in Education and Research
- UNESCO's AI Competency Framework for Teachers
- UNESCO's AI Competency Framework for Students
- OECD research on AI, education and future skills

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

- The OECD/European Commission's 2026 AI Literacy Framework
- India's National Education Policy 2020
- Government of India initiatives relating to AI and education
- IndiaAI Mission initiatives
- The World Economic Forum's Future of Jobs Report 2025
- International Labour Organization research on generative AI and employment
- The author's book, AI and Us: A Comprehensive Guide for Teachers, Students, Parents and Society.

The author's book is treated here as a practitioner perspective and a source of conceptual grounding, while the international reports and policy documents establish the wider research and policy context. No copyrighted passages from any of these sources are reproduced in this paper.

Review of Literature:

1. AI and the Transformation of Education:

NEP 2020 treats technology as a core part of educational transformation and specifically anticipates that Artificial Intelligence, machine learning, adaptive testing and broader educational technologies will influence both what students learn and how they learn it. It also insists that any technological intervention be evaluated rigorously and transparently before being scaled up. This matters because AI cannot be treated as a stand-alone technology initiative. Its educational payoff depends on curriculum design, pedagogy, teacher readiness, infrastructure, assessment practice and institutional capacity working together.

2. Teacher Competency in the AI Era:

UNESCO's AI Competency Framework for Teachers offers an important international benchmark. It lays out fifteen competencies across five dimensions - human-centered mindset, ethics of AI, AI foundations and applications, AI pedagogy, and AI for professional learning - with each competency developing through three stages: Acquire, Deepen and Create. This framework supports a central claim of this paper: teacher AI literacy is not simply knowing how to operate a tool. Teachers must judge when to use AI and when not to, how to evaluate its output critically, and how to safeguard student interests throughout.

3 Student AI Literacy:

UNESCO's parallel framework for students identifies four dimensions - human-centered mindset, ethics of AI, AI techniques and applications, and AI system design - progressing from Understand, to Apply, to Create. The OECD/European Commission's 2026 framework makes a related argument: AI literacy should let students understand how AI systems work, critically evaluate what they produce, and use them ethically and creatively.

Taken together, these frameworks suggest AI education cannot be confined to computing or technical subjects. Every learner, regardless of stream, now needs a foundational grasp of AI.

4 AI and Future Employment:

The World Economic Forum finds AI and big data among the fastest-growing skill areas through 2030, alongside a continued demand for analytical thinking, creativity, resilience, adaptability, leadership and collaboration. The ILO's 2025 analysis pushes back on the simple assumption that AI will eliminate jobs wholesale. Exposure varies task by task, and the more significant change may be in how tasks within a given occupation are reshaped rather than in whether the occupation disappears. Education, then, must prepare students not only to do what AI struggles to do, but to work alongside AI effectively.

AI in Education: From Tool to Learning Ecosystem:

It is a mistake to treat AI as just another piece of classroom technology. Earlier educational technologies mostly supported pedagogical processes that already existed. Generative AI is different - it can take part directly in content creation, explanation, feedback, translation, ideation and interaction. This gives rise to a new ecosystem: Teacher + AI + Student + Data + Pedagogy + Ethics. In AI and Us, the author describes AI as a potential "digital assistant" that supports teachers with lesson planning, learning outcomes, classroom activities and assessment. This practitioner view lines up with UNESCO's teacher-competency framework, which places AI pedagogy alongside ethics and human-centered practice rather than treating it as a separate technical skill. The implication matters: AI should not sit between teacher and learner as an independent authority. It should function as an assistive layer inside a relationship that the teacher continues to lead.

Reimagining the Role of the Teacher:

The question asked most often about AI in education is whether it will replace teachers.

A more useful question is: which parts of teaching can AI genuinely assist, and which remain fundamentally human?

AI can reasonably help with:

- drafting lesson plans
- generating examples and classroom activities
- formative assessment
- building question banks

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

- translation
- summarization
- creating differentiated worksheets
- basic data analysis
- finding resources
- brainstorming
- administrative documentation

But teachers carry out deeper work that AI cannot substitute for:

- reading students' emotional states
- building trust
- motivating learners
- resolving conflict
- understanding local social context
- nurturing values
- building students' confidence
- exercising ethical judgment
- forming genuine human relationships

The author's book imagines the future teacher as a facilitator, mentor, motivator and learning designer rather than simply a provider of information - a view consistent with UNESCO's emphasis on protecting teacher agency while allowing teachers' roles to evolve in an AI-enabled system. The more accurate framing, then, is not Teacher versus AI, but Teacher with AI.

The Student as a Co-Creator:

The traditional model of the student assumes that learning means absorbing information and reproducing it in exams. Generative AI unsettles this model, since information can now be produced almost instantly on demand.

The educational goal needs to shift accordingly - from acquiring information to inquiry, evaluation, creation and application. Students should learn to:

- ask meaningful questions
- use AI to explore possibilities
- verify AI-generated information
- spot bias and misinformation
- compare multiple sources
- improve on AI-generated output
- create original solutions
- explain their own reasoning independently
- acknowledge AI assistance honestly
- reflect on the ethical consequences of their choices

Done this way, AI stops being a shortcut and becomes a learning partner. The author's book raises a similar warning: excessive copy-paste reliance can dull thinking and problem-solving, and AI should be treated as a partner in learning rather than a way around it.

Proposed Human-Centered AI Education Framework:

Drawing on the literature reviewed and the author's own practitioner experience, this paper proposes a six-dimensional model: the H-AI Education Framework.

Dimension 1: AI Literacy

Every teacher and student should have a working understanding of:

- what AI is
- how machine learning works at a basic level
- what generative AI can and cannot do
- what a prompt is
- why AI systems hallucinate
- what bias means in this context
- how AI systems use data

AI literacy should become a foundational digital competency, not a niche specialization.

Dimension 2: AI-Augmented Pedagogy

AI should support pedagogy, not dictate it. Teachers can draw on AI for:

- differentiated instruction
- designing activities
- formative assessment
- multilingual support
- personalized explanations
- adapting content
- project-based learning

The final pedagogical call, however, stays with the teacher.

Dimension 3: Human Skills

AI adoption needs to go hand in hand with deliberate cultivation of:

- critical thinking
- creativity
- communication
- collaboration
- empathy
- leadership
- resilience
- adaptability
- curiosity
- ethical reasoning

This is reinforced by the WEF's finding that human-centered skills stay essential even as demand for technical skills climbs.

Dimension 4: Ethical and Responsible AI

Every institution using AI needs working principles around:

- privacy
- consent
- data minimization
- transparency
- bias
- academic integrity
- copyright
- misinformation

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

- deepfakes
- accountability

UNESCO's guidance is explicit that generative AI in education should be safe, equitable, meaningful and human-centered.

Dimension 5: Inclusive Digital Infrastructure:

AI cannot be a genuine tool of development if access to it is uneven. The author's book identifies internet access, the digital divide, teacher training, cost and cybersecurity as major obstacles to building Smart Schools. AI education policy therefore needs to address:

- reliable connectivity
- affordable devices
- multilingual resources
- accessible platforms
- offline or low-bandwidth options
- cybersecurity
- ongoing teacher support

Dimension 6: Continuous Professional Learning:

AI evolves quickly, so a single workshop will not be enough. Teachers need ongoing professional development that moves through: Acquire → Apply → Evaluate → Create → Reflect - a progression broadly compatible with UNESCO's own competency model.

AI, Indian Languages and Educational Inclusion

India's linguistic diversity is both a challenge and an opening. A genuinely inclusive AI education system cannot remain built around English. Students need to be able to engage with educational technology in Indian languages - Marathi, Hindi, Tamil, Telugu, Kannada, Bengali and beyond. The author's book points specifically to the growing relevance of AI in Indian languages, naming Marathi among the languages where AI use is expanding. But multilingual AI needs careful scrutiny. UNESCO's 2025 report on Indian education notes that coverage of languages and dialects remains patchy, particularly for spontaneous, code-switched everyday speech. Indian-language AI, in other words, should do more than translate English content. It needs to build in local cultural context, linguistic variety and community knowledge.

Digital Divide: The Risk of Creating Two Educational Indias

One of the sharpest risks here is that AI could widen educational inequality rather than close it. Consider two students. Student A has high-speed internet, a personal device, paid AI tools, strong digital literacy and parents who can support their AI use. Student B shares a single basic smartphone with the family, has patchy connectivity, limited digital literacy and no adult at home who can help with AI. Handing both students the same AI platform does not hand them the same opportunity. Access to AI is not the same thing as inclusion in AI-enabled learning. India's AI education strategy has to tackle infrastructure, affordability, language and teacher capacity together - and this matters most for rural, tribal, low-income and otherwise marginalized communities, where digital access is already uneven.

Assessment in the Age of Generative AI

Generative AI complicates the traditional model of homework and examinations. If a student can generate an essay, solve a problem or build a presentation with AI assistance, judging only the final product may no longer tell us much about what they have actually learned.

Assessment should lean more heavily on:

- oral explanation
- viva voce
- classroom discussion
- project journals
- reflection notes
- drafts and revisions
- the problem-solving process itself
- practical demonstrations
- collaborative projects
- source verification
- disclosure of AI use

The question worth asking should shift from "what answer did the student produce?" to "how did the student think, verify, create and defend that answer?" - a shift that can strengthen academic integrity rather than undermine it.

AI Ethics, Privacy and Academic Integrity

Bringing AI into schools creates a new layer of institutional responsibility. Student data can include names, photographs, academic records, behavioral notes, voice recordings and other sensitive material - none of which should be fed into an AI system without clear institutional safeguards in place. The author's book warns specifically against sharing personal information, passwords or confidential documents with AI tools, given the privacy risks involved. Academic integrity is the other pressing concern. Students should not be encouraged to submit AI-generated work as their own without understanding it, verifying it or disclosing how it was produced. Schools would do well to adopt a simple guiding principle: use AI to think better, not to avoid thinking. Teachers, too, should be careful not to outsource their own professional judgment to AI systems.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Human Intelligence as the Strategic Advantage

As AI grows more capable, human intelligence becomes more valuable, not less. Machines are increasingly strong at pattern recognition, fast information processing, text generation, translation, prediction and repetitive digital tasks. Humans remain indispensable for empathy, moral judgment, contextual understanding, relationships, purpose, imagination, responsibility and social leadership. Education, then, should not be designed to produce people who compete with machines at machine-like tasks. It should develop people who can use machines well while contributing exactly the qualities machines cannot reliably offer - a point reinforced by the WEF's finding that even as technical skills rise, analytical thinking, creativity, resilience, leadership and collaboration remain central to employability.

AI and the Vision of Viksit Bharat @2047

Viksit Bharat calls for a workforce capable of holding its own in a technology-driven global economy. That means India needs an education system that produces not just consumers of AI, but its creators, evaluators and responsible citizens. The India AI Mission's ecosystem - spanning future skills, datasets, compute infrastructure, application development, startup financing and safe, trusted AI - reflects a serious national push in this direction. Education is the bridge between that national technology ecosystem and ordinary citizens.

A plausible strategic pathway looks like this: AI Literacy → AI Skills → AI-enabled Learning → Innovation → Entrepreneurship → Employment → Inclusive Growth → Viksit Bharat.

But that pathway needs an ethical foundation running alongside it: Human Values + AI Capability= Responsible Development. Without that balance, technological progress risks deepening inequality, misinformation, surveillance, dependency or social fragmentation.

Policy Recommendations:

1. Build a National AI Literacy Continuum

AI literacy should be introduced progressively across stages of schooling: awareness at the primary level, understanding in middle school, application in secondary school, creation and critical evaluation at the higher secondary level, and specialization and research in higher education.

2. Set AI Competency Standards for Teachers

Teacher education should cover AI foundations, prompt literacy, AI pedagogy, ethical AI, data privacy, assessment redesign, misinformation detection, and AI-assisted professional development.

3. Create a School-Level AI Policy

Every school using AI should have a short institutional policy addressing permitted and prohibited uses, privacy, student age, academic integrity, teacher accountability and disclosure of AI assistance.

4. Prioritise Rural and Underserved Schools

Government programmes should prioritise connectivity, shared-device models, offline AI learning resources, local-language content, teacher training and community-level digital literacy.

5. Invest in Indian-Language AI

India should invest in datasets, educational content and interfaces built for Indian languages and dialects, not just translated versions of English tools.

6. Redesign Assessment

Assessment frameworks should reward reasoning, originality, application, reflection and oral defence - not just a polished final output.

7. Establish Human Oversight

AI-generated recommendations should never be allowed to automatically determine high-stakes decisions - student promotion, exclusion, disciplinary action or career pathways - without meaningful human review.

8. Encourage Teacher-Led Innovation

Teachers should be treated as co-designers of AI-enabled solutions, not merely as end users, since they understand classroom realities that technology developers often cannot see from outside.

9. Build AI Ethics into the Whole Curriculum

Ethics should not stay confined to computer science. Students across humanities, commerce, science and vocational and professional courses should all engage with the social consequences of AI.

10. Build a Culture of Lifelong Learning

Because AI keeps changing, education needs to move away from a one-time qualification model and toward continuous reskilling and upskilling.

Discussion:

The central finding of this conceptual analysis is that the educational value of AI depends less on how sophisticated the technology is and more on the quality of the human decisions surrounding its use. A powerful AI system placed in an unprepared classroom can increase dependence, misinformation and inequity. A comparatively simple AI tool used in a well-prepared classroom can support differentiated learning, creativity and teacher productivity. India's AI education strategy, therefore, should avoid a technology-first approach - the sequence should run Educational Need →

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Pedagogical Purpose → AI Selection → Ethical Evaluation → Human Oversight → Learning Evidence, rather than New AI Tool → Classroom Adoption → Search for a Problem. This distinction matters for sustainable transformation. Teacher professional development, in particular, needs to move beyond simply demonstrating tools - a workshop that teaches teachers to operate one specific application can become outdated quickly. A competency-based approach lasts longer, because it teaches teachers how to evaluate technologies and pedagogical choices regardless of which specific tool is in front of them - an argument well supported by UNESCO's competency-based framework and the OECD's growing emphasis on AI literacy.

Proposed "AI-Ready School" Model

This paper proposes the following institutional model, expressed through the acronym **"AI-READY":**

A - **Awareness:** understand AI and its social impact.

I - **Intelligence:** develop AI literacy and critical thinking.

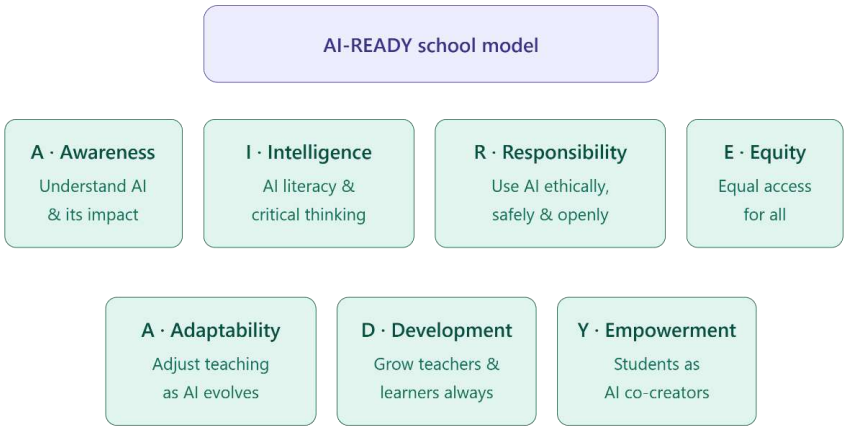
R - **Responsibility:** use AI ethically, safely and transparently.

E - **Equity:** ensure access regardless of geography, language or socioeconomic status.

A - **Adaptability:** adjust teaching and institutions as AI evolves.

D - **Development:** continuously develop teachers, learners and institutions.

Y - **Youth Empowerment:** prepare students as confident co-creators with AI.



Prepare students to become confident, creative and responsible co-creators with AI- not passive consumers of what it produces.

Limitations of the Study

This paper is conceptual. It does not report primary empirical data from a controlled study, student sample or teacher survey, so the proposed H-AI Education Framework should be read as a conceptual model still awaiting empirical validation.

Future research could test the framework through:

- longitudinal studies of AI-assisted classrooms
- teacher competency assessments
- student AI-literacy assessments
- rural-urban comparative studies
- studies of Indian-language AI
- experimental comparisons of AI-supported and conventional pedagogies
- research on AI-assisted assessment
- studies of AI's impact on creativity and critical thinking

Evidence of this kind would help move the conversation from technological enthusiasm or anxiety toward genuinely evidence-based policy.

Conclusion

Artificial Intelligence is not simply the next chapter in the history of educational technology- it marks a deeper shift in how knowledge is generated, accessed, evaluated and applied. For India, this shift could become a powerful engine for reaching Viksit Bharat @2047, but only if the technology is matched by educational wisdom. The core argument of this paper is straightforward: India does not need an AI-dependent education system. It needs an AI-capable, human-centered one. The teacher of the future will not matter less because information has become abundant - the role will simply evolve, from information provider to mentor, facilitator, learning designer, ethical guide and human anchor. The student of the future should not merely consume AI-generated content, but become an informed user, a critical evaluator, a creative co-creator and a responsible citizen. And the school of the future should be defined not by the number of smart devices it owns, but by smart pedagogy, inclusive access, ethical technology use, strong human relationships and a genuine culture of continuous learning. The real objective of AI in

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

education is not to make learning more automated - it is to make it more personalized, inclusive, creative, humane and future-ready. On the road to Viksit Bharat @2047, perhaps the equation that matters most is not Human vs. AI, but Human Intelligence + Artificial Intelligence + Human Values = Responsible and Sustainable Development. India's greatest advantage in the AI era will not come from building machines that imitate humans. It will come from educating humans who know how to use machines without losing their humanity.

Acknowledgement

The authors would like to express their sincere gratitude to all those who contributed, directly or indirectly, to the successful completion of this research paper titled "Human-Centered AI Education for Viksit Bharat @2047: Reimagining Teachers, Learners and Future-Ready Schools." The authors are grateful to the scholars, researchers, educational institutions, policymakers, and international organizations whose research, policy documents, and frameworks provided valuable insights into Artificial Intelligence, AI literacy, teacher competency, ethical AI, digital education, and future-ready skills. The contributions of UNESCO, OECD, the Government of India, IndiaAI, the World Economic Forum, and the International Labour Organization have been particularly valuable in shaping the conceptual foundation of this study.

Abstract

The logistics sector is among the largest contributors to global greenhouse gas emissions on account of its heavy dependence on fossil-fuel-powered transportation, energy-intensive warehousing, and inefficient resource utilisation across supply chains. As governments, consumers, and investors increasingly demand environmentally responsible business practices, organisations are under mounting pressure to decarbonise their logistics operations without compromising service levels or cost competitiveness. Artificial Intelligence (AI) has emerged as a powerful enabler of this transition, offering data-driven tools that can simultaneously improve operational efficiency and environmental performance. This paper examines the role of AI in advancing sustainable logistics, with specific emphasis on opportunities for carbon emission reduction and resource optimisation. Drawing on secondary sources and recent scholarship, the study explores AI applications such as route and fleet optimisation, predictive maintenance, demand forecasting, warehouse automation, smart packaging, electric and autonomous vehicle integration, and carbon accounting systems. The paper further discusses illustrative industry examples, the barriers that hinder widespread AI adoption in logistics, and recommendations for practitioners and policymakers. The findings suggest that while AI offers substantial potential to reduce fuel consumption, emissions, and waste, its benefits are contingent upon data quality, infrastructure readiness, financial investment, and organisational willingness to change. The study concludes that a strategic, phased, and collaborative approach to AI adoption can help logistics firms achieve measurable progress toward carbon neutrality and resource efficiency goals.

Keywords: *Artificial Intelligence, Sustainable Logistics, Carbon Reduction, Resource Optimization, Green Supply Chain, Route Optimization, Machine Learning*

Introduction

Logistics and supply chain activities underpin virtually every sector of the modern economy, moving raw materials, components, and finished goods across increasingly complex global networks. However, this connectivity comes at a significant environmental cost. Freight transportation, warehousing, and distribution collectively account for a substantial share of worldwide carbon dioxide emissions, and the sector's environmental footprint continues to expand alongside e-commerce growth, just-in-time delivery expectations, and last-mile fulfilment demands. International frameworks such as the Paris Agreement and successive Conferences of the Parties (COP) have repeatedly underscored the urgency of decarbonising freight and transport networks as part of broader climate action commitments. At the same time, the scale and complexity of global logistics networks make emission reduction a genuinely difficult engineering and managerial problem.

Website: https://bnir.us

Thousands of interdependent variables — vehicle routing, load consolidation, warehouse layout, inventory levels, supplier lead times, and customer demand patterns — must be optimised simultaneously, often under conditions of uncertainty. Traditional optimisation methods, while useful, frequently struggle to process the volume and velocity of data generated by modern supply chains in real time. Artificial Intelligence, encompassing machine learning, deep learning, natural language processing, and computer vision, offers a fundamentally different capability: the ability to learn patterns from historical and real-time data, generate predictive insights, and recommend or automate decisions at a scale and speed beyond human capacity. This paper investigates how AI technologies are being deployed across logistics functions to simultaneously advance two interconnected sustainability objectives: reducing carbon emissions and optimising the use of physical, financial, and human resources. The study is motivated by the observation that sustainability and efficiency are not competing goals in modern logistics; rather, AI-enabled efficiency gains frequently translate directly into environmental benefits, since reduced fuel consumption, shorter routes, better-utilised vehicle capacity, and leaner inventories all correspond to a smaller carbon footprint.

Literature Review

A growing body of scholarship has examined the intersection of AI and sustainable logistics. Haleem, Javaid, Khan, and Mohan (2023) reviewed the significant applications of AI toward attaining sustainability across manufacturing and logistics domains, noting that predictive analytics and intelligent automation are central to reducing resource wastage. Chen, Men, Fuster, Osorio, and Juan (2024), in a systematic review published in Sustainability, mapped the growing body of literature connecting AI and logistics performance with the United Nations Sustainable Development Goals, observing a sharp rise in publications on this theme since 2015 and highlighting transportation, packaging, and procurement as the logistics activities most responsible for carbon emissions. Research focused specifically on route optimisation has demonstrated measurable environmental gains. Studies applying algorithms such as ant colony optimisation, neural networks, and hybrid genetic algorithms to vehicle routing problems have shown that AI-guided routing can meaningfully reduce fuel consumption and emissions when compared with conventional, non-AI-assisted routing practices. Complementary work on electric vehicle (EV) integration suggests that AI-enabled predictive maintenance and energy management can reduce maintenance costs and unplanned downtime while easing the grid demand associated with large-scale EV charging, thereby supporting the broader shift toward electrified freight fleets. On the demand-side of logistics, Hasan, Islam, and Rahman (2025) examined AI-driven demand forecasting models and found that improved predictive accuracy allows firms to align production and inventory more closely with actual consumption, reducing overproduction, excess stock, and the associated waste of materials and transportation capacity. Related work on green supply chain management has emphasised that AI and deep learning techniques are increasingly used by small and medium-sized enterprises to reduce carbon emissions through improved logistics process optimisation, while research on circular economy logistics has shown that AI can support recycling and reverse-logistics decisions that reduce landfill waste and material extraction. Despite this optimism, several scholars caution that AI adoption in logistics faces structural barriers. McKinnon (2024) notes that decarbonising freight movement requires coordinated investment in infrastructure, technology, and policy, not merely isolated technological interventions. Moktadir and Ren (2024) similarly find that limited funding, weak market incentives, and inadequate institutional support constrain green logistics adoption in many emerging economies. This literature collectively suggests that while the technical potential of AI for sustainable logistics is well established, its realisation depends heavily on organisational, financial, and policy conditions.

Objectives of the Study

The present study is guided by the following objectives:

1. To examine the key areas of logistics operations where Artificial Intelligence can be applied to reduce carbon emissions.
2. To analyse how AI contributes to the optimisation of physical, financial, and human resources within supply chains.
3. To identify the practical challenges and barriers that limit the adoption of AI-driven sustainability solutions in logistics organisations.
4. To offer recommendations for logistics managers and policymakers seeking to leverage AI for sustainable and resource-efficient operations.

Research Methodology

This study adopts a descriptive and analytical research design based on secondary data. Information has been gathered and synthesised from peer-reviewed journal articles, industry reports, and reputable academic databases

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

published primarily between 2022 and 2025, focusing on the application of Artificial Intelligence in logistics, supply chain management, and environmental sustainability. The study does not involve primary data collection; rather, it draws together existing scholarly and industry evidence to build a conceptual understanding of how AI technologies map onto specific opportunities for carbon reduction and resource optimisation. Content analysis was used to categorise AI applications into functional areas of logistics (transportation, warehousing, inventory, packaging, and reporting), which form the structural basis of the discussion that follows.

AI Applications in Sustainable Logistics

1. Route Optimisation and Fuel Efficiency

One of the most mature and widely adopted applications of AI in logistics is intelligent route optimisation. Machine learning algorithms can process real-time traffic data, weather conditions, delivery time windows, and vehicle capacity constraints to compute the most fuel-efficient routes across an entire delivery fleet. Techniques such as ant colony optimisation, genetic algorithms, and reinforcement learning have been shown to outperform static, rule-based routing systems, particularly in dynamic urban environments where congestion and delivery density change throughout the day. By minimising unnecessary mileage, reducing idle time, and avoiding congested routes, AI-driven routing directly lowers fuel consumption and the associated tailpipe emissions.

2. Predictive Maintenance

AI-powered predictive maintenance systems use sensor data from vehicles and equipment to anticipate mechanical failures before they occur. Rather than following fixed maintenance schedules, machine learning models analyse patterns in engine performance, vibration, temperature, and usage history to flag components that are likely to fail. This reduces unplanned downtime, extends the useful life of vehicles and machinery, and ensures that engines and drivetrains continue operating at optimal fuel efficiency. For electric vehicle fleets, predictive analytics applied to battery thermal management has also been associated with extended battery life and more efficient energy use, supporting the broader transition toward low-emission fleets.

3. Warehouse and Inventory Optimisation

Within distribution centres, AI is used to optimise warehouse layout, slotting, and picking paths, reducing the distance travelled by both human workers and automated guided vehicles. Machine learning-based inventory management systems can dynamically adjust stock levels based on demand signals, seasonal patterns, and supplier lead times, minimising both overstocking and stockouts. Because overproduction and excess inventory ultimately translate into wasted materials, additional storage energy consumption, and unnecessary transportation, more precise inventory control represents a meaningful lever for resource efficiency. AI-enabled robotics and automated storage and retrieval systems further reduce the energy intensity of warehouse operations by optimising equipment movement and reducing idle machine time.

4. Demand Forecasting

Accurate demand forecasting is foundational to resource-efficient logistics. AI models that incorporate historical sales data, macroeconomic indicators, weather patterns, and even social media sentiment can generate demand forecasts that are considerably more accurate than traditional statistical methods. Improved forecast accuracy allows firms to align production volumes, procurement schedules, and transportation capacity more closely with actual market demand, reducing the waste associated with overproduction, expedited shipping, and last-minute route changes — all of which carry a disproportionate carbon cost relative to planned, consolidated shipments.

5. Smart Packaging and Load Optimisation

AI algorithms are increasingly applied to packaging design and load planning, determining the optimal combination of package sizes and configurations to maximise vehicle and container fill rates. By reducing the empty space within shipments, these systems allow more goods to be transported per trip, directly reducing the number of vehicle movements required and the associated fuel use and emissions per unit shipped. Some systems also recommend more sustainable packaging materials based on product characteristics, balancing protection requirements against material weight and recyclability.

6. Electric and Autonomous Vehicle Integration

The transition toward electric and autonomous freight vehicles is closely intertwined with AI. Beyond predictive maintenance and battery management, AI systems support charging infrastructure planning by forecasting energy demand across a fleet and scheduling charging during off-peak periods to reduce strain on the electricity grid. Autonomous and semi-autonomous vehicles, guided by AI perception and decision-making systems, can also optimise driving behaviour such as acceleration, braking, and speed

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

to minimise energy consumption, complementing the emissions benefits of electrification itself.

7. Carbon Footprint Tracking and Reporting

Finally, AI-based carbon accounting platforms are helping logistics firms measure, monitor, and report emissions across their operations and supply chains with greater precision than manual estimation methods allow. By integrating data from transportation management systems, fuel consumption records, and supplier disclosures, these platforms can generate granular, shipment-level emissions estimates. This visibility not only supports regulatory compliance and corporate sustainability reporting but also enables managers to identify the specific routes, vehicles, or facilities contributing disproportionately to the firm's overall carbon footprint, guiding targeted improvement efforts.

Opportunities for Carbon Reduction

Synthesising the applications discussed above, several concrete opportunities for AI-enabled carbon reduction emerge. First, dynamic route and load optimisation reduces total distance travelled and improves vehicle fill rates, directly lowering fuel consumption per unit of freight moved. Second, predictive maintenance keeps engines and drivetrains operating near peak efficiency, preventing the gradual fuel-efficiency losses associated with deferred or reactive maintenance. Third, AI-supported transition to electric and autonomous fleets, combined with intelligent charging and energy management, reduces both tailpipe emissions and the indirect emissions associated with inefficient grid usage. Fourth, improved demand forecasting reduces the frequency of emergency, expedited, or partially loaded shipments, which tend to carry a higher emissions intensity than planned, consolidated freight movements. Finally, AI-based carbon measurement and reporting tools create the visibility necessary for continuous improvement, allowing firms to set science-based targets and track progress with a level of granularity that manual methods cannot match.

Opportunities for Resource Optimization

Beyond carbon reduction, AI offers substantial opportunities to optimise the broader set of resources consumed by logistics operations. Inventory optimisation reduces the capital tied up in excess stock and the physical storage space and energy required to house it. Warehouse automation and slotting optimisation reduce labour hours and equipment wear associated with inefficient picking and movement patterns. Predictive maintenance extends the useful economic life of vehicles, machinery, and material-handling equipment, reducing the resource intensity of replacement and repair. Smart packaging reduces material consumption while maintaining product protection, and AI-guided procurement systems can identify opportunities to consolidate orders and negotiate more favourable terms with suppliers, reducing transactional and administrative overhead. Collectively, these applications illustrate that resource optimisation and carbon reduction are mutually reinforcing outcomes of the same underlying AI capability: the ability to extract actionable insight from complex, high-volume operational data.

Industry Illustrations

Several patterns observed across industry practice illustrate the practical application of these concepts. Large parcel-delivery and logistics companies have publicly reported the use of AI-driven route optimisation software to reduce the number of turns, backtracking, and idling time experienced by delivery drivers, translating into measurable reductions in fuel consumption across large vehicle fleets. Global retailers and e-commerce firms have deployed AI-based demand forecasting and inventory allocation systems to reduce overstock and improve the efficiency of warehouse-to-store replenishment, reducing both wasted inventory and unnecessary transportation legs. In the shipping and freight sector, AI-enabled voyage optimisation tools that account for weather routing, vessel speed, and cargo loading have been used to reduce fuel burn on long-haul ocean freight, a segment that is otherwise difficult to decarbonise given the limited availability of low-carbon marine fuels. These illustrative examples, while varying in scale and sector, share a common thread: AI is most effective when applied to well-defined, data-rich operational decisions that recur frequently enough for machine learning models to learn meaningful patterns.

Challenges and Barriers to AI Adoption

Despite its considerable promise, the adoption of AI for sustainable logistics faces several practical barriers. Data quality and availability remain a persistent challenge, as many logistics organisations, particularly small and medium-sized enterprises, lack the integrated data infrastructure required to train and operate effective AI models. High upfront investment costs for AI systems, sensors, and supporting digital infrastructure can also deter adoption, especially among firms operating on thin margins. A shortage of skilled personnel capable of developing, implementing, and maintaining AI systems further constrains adoption, as does organisational resistance to changing established operational processes and

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

decision-making practices. Infrastructure limitations present an additional barrier, particularly for AI applications tied to electric vehicle adoption, where inadequate charging infrastructure and grid capacity can undermine the theoretical benefits of AI-optimised fleet electrification. Regulatory and policy uncertainty, including inconsistent carbon reporting standards across jurisdictions, can complicate efforts to design AI-based carbon accounting systems that are both accurate and compliant. Finally, concerns around data privacy, cybersecurity, and algorithmic transparency can slow adoption, particularly in collaborative, multi-party supply chain settings where data sharing across organisational boundaries is required for AI systems to reach their full potential.

Recommendations

Based on the discussion above, the following recommendations are proposed for logistics organisations and policymakers seeking to leverage AI for sustainability outcomes. Logistics firms should begin with focused, high-impact pilot projects — such as route optimisation or predictive maintenance — that generate measurable efficiency and emissions benefits before scaling AI investment across the wider organisation. Firms should also prioritise building robust, integrated data infrastructure, as the effectiveness of any AI system is fundamentally constrained by the quality and completeness of the underlying data. Investment in workforce training and change management is equally important, ensuring that employees understand and trust AI-generated recommendations rather than viewing them as opaque or threatening. Collaboration across supply chain partners should be encouraged to enable the data sharing necessary for network-wide optimisation, such as coordinated route planning or shared warehousing. Policymakers, in turn, can support AI-enabled decarbonisation by developing consistent carbon reporting standards, offering incentives for green technology adoption among small and medium-sized logistics firms, and investing in supporting infrastructure such as EV charging networks. Finally, organisations should treat carbon reduction and resource optimisation as complementary rather than competing objectives when designing and evaluating AI initiatives, since the evidence reviewed in this study suggests that efficiency-focused AI applications frequently deliver environmental benefits as a natural by-product of improved operational performance.

Conclusion

Artificial Intelligence offers logistics organisations a practical and increasingly proven pathway toward reducing carbon emissions and optimising the use of physical, financial, and human resources. From route and load optimisation to predictive maintenance, demand forecasting, and carbon accounting, AI applications across the logistics value chain demonstrate that sustainability and operational efficiency are deeply interconnected outcomes of the same underlying capability to extract insight from data. At the same time, realising these benefits at scale requires organisations to address persistent barriers related to data infrastructure, investment costs, workforce capability, and supporting policy frameworks. Logistics firms that adopt a strategic, phased approach to AI implementation — beginning with high-impact use cases and progressively building the data and organisational capabilities required for broader deployment — are best positioned to achieve meaningful, measurable progress toward carbon reduction and resource efficiency goals. As global pressure for decarbonisation intensifies, AI is likely to move from a competitive differentiator to a foundational requirement for sustainable logistics operations.

Acknowledgement

The authors would like to express their sincere gratitude to all those who contributed, directly or indirectly, to the successful completion of this research paper titled "Artificial Intelligence in Sustainable Logistics: Opportunities for Carbon Reduction and Resource Optimization." The authors are grateful to their respective institutions, colleagues, and academic peers for their valuable support, encouragement, and constructive suggestions throughout the course of this study. Special appreciation is extended to the researchers and scholars whose published works, reports, and academic contributions provided valuable insights into Artificial Intelligence, sustainable logistics, carbon reduction, and resource optimisation.

Abstract

The landscape of accountancy and financial reporting has undergone a monumental shift driven by rapid technological advancements, evolving regulatory frameworks, and increasing demand for corporate transparency. Traditional financial reporting models are shifting toward real-time data access, automated audit trails, and integrated non-financial disclosures. This research paper examines the convergence of automation, Artificial Intelligence (AI), and Sustainable Financial Reporting (ESG disclosures) within modern accounting practices. It highlights key challenges faced by organizations during implementation and presents a prospective framework for accounting professionals to navigate digital disruption while maintaining reporting accuracy, transparency, and compliance.

Keywords: *Financial Reporting, Accountancy, ESG Disclosures, Artificial Intelligence, Integrated Reporting, Corporate Governance.*

Introduction

Financial reporting serves as the backbone of economic capital allocation, offering investors, regulators, and management a comprehensive view of an entity's financial health. Traditionally focused on historical cost accounting and periodic disclosures, modern accounting now operates in a volatile, complex, and digitalized environment. Stakeholders today require forward-looking metrics, non-financial sustainability metrics, and immediate data availability. This transition requires a re-evaluation of core accounting principles, standard audit protocols, and compliance mechanisms. The objective of this paper is to analyze the key trends shaping modern accountancy, assess the impact of advanced technology on reporting quality, and discuss the implications of international accounting convergence.

Literature Review

Recent scholarly works highlight two primary catalysts reshaping financial reporting: **Digital Transformation** and **ESG Integration**.

Digital Transformation:

Research by Deloitte and PwC underscores that automation reduces manual entry errors by up to 80% and allows accountants to focus on strategic financial planning rather than transaction processing.

ESG & Non-Financial Reporting:

According to the International Financial Reporting Standards (IFRS) Foundation, financial statements alone are no longer sufficient to evaluate long-term firm value. Stakeholders now expect environmental, social, and governance metrics alongside standard balance sheets.

Website: https://bnir.us

Regulatory Harmonization:

The adoption of International Financial Reporting Standards (IFRS) across multiple jurisdictions has improved cross-border capital flow and comparability, though local regulatory nuances remain a hurdle.

Key Drivers Transforming Accountancy & Financial Reporting

1. Automation and Artificial Intelligence (AI)

Modern financial systems utilize Machine Learning (ML) algorithms and Robotic Process Automation (RPA) to handle repetitive accounting tasks such as data entry, bank reconciliations, and payroll processing.

- **Benefits:** Increased computational speed, operational efficiency, and minimized human error.
- **Risk Management:** Predictive analytics allow real-time detection of financial anomalies and fraud prevention.

2. Sustainable and ESG Reporting

The global focus on climate change and corporate responsibility has made sustainability reporting integral to financial health. The establishment of the International Sustainability Standards Board (ISSB) has created global benchmarks (IFRS S1 and IFRS S2) to unify ESG metrics with core financial statements.

3. Blockchain Technology and Real-Time Auditing

Blockchain offers a decentralized, immutable ledger system for transactions. This architecture enables triple-entry accounting, where transactions are verified cryptographically. This significantly reduces the reliance on traditional end-of-year audits in favor of continuous, real-time auditing.

Major Challenges Facing Modern Accountancy

1. **Cyber security & Data Privacy Risks:** As accounting infrastructure moves to cloud-based systems, sensitive financial data becomes vulnerable to cyber threats and unauthorized breaches.
2. **Skill Gap in the Accounting Workforce:** Traditional accounting education often lacks deep technical training in data analytics, Python/R programming, and AI tools, creating a talent gap in the market.
3. **Regulatory Fragmentation:** Keeping pace with rapidly evolving domestic laws, international tax frameworks, and constantly updated IFRS guidelines presents a heavy compliance burden for SMEs.

Comparative Analysis: Traditional vs. Modern Financial Reporting

Parameter	Traditional Financial Reporting	Modern Financial Reporting
Reporting Cycle	Monthly / Quarterly / Annual	Real-time / Continuous
Primary Focus	Historical Financial Data	Integrated (Financial + ESG Data)
Data Processing	Manual Ledger Entries & Spreadsheets	AI, RPA, and Cloud-Based ERP
Audit Methodology	Post-event Sample Auditing	Continuous Real-Time Auditing
Value Indicator	Net Profit & Assets	Long-Term Value & Sustainability

Recommendations for International Conference & Policy

1. **Curriculum Modernization:** Educational institutions and professional accounting bodies must integrate data analytics, cybersecurity, and ESG metrics into core accounting syllabi.
2. **Standardization of Non-Financial Metrics:** Regulatory bodies should establish unified global benchmarks to avoid "greenwashing" in corporate disclosures.
3. **Adoption of Secure Infrastructure:** Organizations should prioritize robust cloud security measures and cryptographic protocols to protect financial data integrity.

Conclusion

The field of accountancy and financial reporting is undergoing a fundamental shift from a historical recording mechanism to a strategic, technology-driven decision-making framework. The integration of AI, real-time data access, and ESG metrics enhances the relevance and reliability of financial statements. Embracing technological innovation while upskilling financial professionals will ensure that the accounting discipline remains resilient, transparent, and capable of driving global economic stability.

Abstract

Indian economy has grown rapidly in the last two decades, as a result of change in the business environment and thereby attracted massive investment from domestic and foreign players. This study is an effort to understand the revolution which has taken place in the Indian retail industry. Moreover, with the help of this study the researcher has made an attempt to analyze the shopping behaviour of consumer and try to assess consumer's perception with respect to organized retailer. In order to analyze the consumer's perception a survey has been conducted in Mumbai city and suburbs and based on the survey findings has been drawn by the researcher. The findings are based on the structured questionnaire collected from 100 respondents and the data has been collected through convenience sampling method. Organized retailer's popularity among the consumers is growing and thereby favouring the Mall culture which is quite prevalent in the Western Countries. Specially, youth prefer to shop more at modern retail formats as compared to consumer of adult and mature age groups. Moreover the research also highlight that Indian consumers are price sensitive also.

Keywords *:Indian Economy, Shopping Behaviour, Consumer's Perception, Retail Formats, Mall Culture.*

Introduction:

Retailing is one of the most significant ventures in our nation, India. Napoleon Bonaparte's agree about 'a country of retailers' despite everything has a ring of truth. The retail part in India is seeing a huge development and creating enormous business. Retailing, perhaps the biggest segment in the worldwide economy and is going through a change stage in India as well as everywhere on over the world. For a long time, the corner supermarket was the main decision accessible to the purchaser, particularly in the urban zones. This is gradually offering approach to worldwide organizations of retailing. The conventional food and staple portion has seen the rise of stores/staple chains (Food World, Nilgiris, Apna Bazaar), accommodation stores (Convenio, HP Speed bazaar) and inexpensive food chains (McDonalds, Dominos). It is the non-food portion; anyway that invasion has been made into an assortment of new parts. These incorporate way of life/design sections (Shoppers' Stop Westside), attire/adornments (Levis, Reebok), books/music/endowments (Archives). In India retailing is getting worldwide acknowledgment and consideration and this is developing business sector that is seeing a huge change in its development and speculation design. According to Global Retail Development Index (GRDI) 2012 high sparing and venture rates;

Website: https://bnir.us

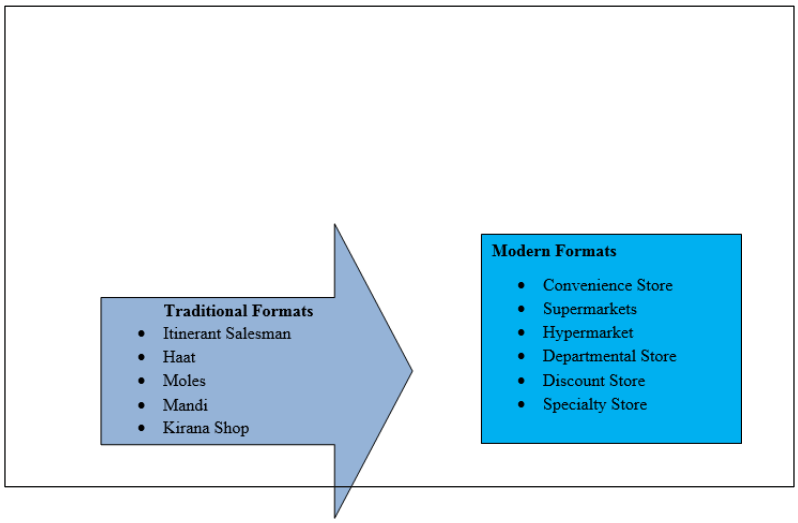
quick work power development; and expanded customer spending-make India the fifth spot in the GRD and additionally for an entirely positive retail condition.

The retail division over India might make generally part under those composed and the chaotic segment. The chaotic division will be predominant. We might discuss over point of interest those diverse divisions of the retail segment Previously, India. The chaotic retail division fundamentally incorporates the neighbourhood Kirana store, the road side vendors and so forth. This segment constitutes regarding 93% of the aggregate retail profession. In the composed segment exchanging will be embraced by those authorized retailers who need enrolled themselves to bargains and in addition salary charge.

Development of the Indian Retail industry:

Retail in India need advanced backing and those exceptional necessities should our country provide to the retailers. Haats, Mandis and Melas have generally been the only the scene of the Retail in India. The advancement of the government funded dissemination about grains over India need its Inception in the 'rationing' framework acquainted toward the British Throughout the universe War II. The framework might have been begun in 1939 in Bombay Also consequently stretched out on different urban areas what's more towns. Traditional Formats

- Itinerant Salesman
- Haat
- Moles
- Mandi
- Kirana Shop



Toward those quite a while 1946, as A large number of 771 urban communities / towns were secured. Those framework might have been abolished post war, however, around achieving Independence, India might have been constrained will reintroduce it for 1950 in the face of replenished inflationary weights in the economy. Following the Development about Indian retail might make inadequate without specify of the flask saves division and the Post business settings in India. Those khadi & town commercial enterprises (KVIC) might have been likewise set up post autonomy. Today, there are more than 7,050 KVIC saves the nation over. Those Co-operative developments might have been once more championed toward the administration which set up Kendriya Bhandras for 1963. In Maharashtra, Bombay Bazaar, Sahakari Bhandar, Also Apna Bazaars run an expansive chain of Co-operative are few examples. In the 1990's the Indian economy gradually advanced starting with state prompted getting to the business sector inviting economy. Same time free retail chain such as Akbarally, Vivek have existed to India. One of the pioneers in this field was Raymond which set up retail locations for texture. Other material makers who likewise set up their own retail chains were Reliance which set up Vimal Showrooms and Garden Silk Mills with Garden Vareli. With the accomplishment of the marked menswear store, the new age departmental store showed up in India in the mid nineties. This was from a genuine perspective, the start of new period retailing in India. The way that post advancement, the economy has opened up and another huge working class with spending power had developed to shape this part. The tremendous working class market requested an incentive for cash items, a superior shopping feel, more accommodation and one quit shopping. This has

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

fuelled the development of departmental stores, markets and other claim to fame stores.

Retailers Industry-A review:

In India, the business is huge, representing around 35% of GDP, which is the second biggest after agribusiness. Yearly retail deals in India are assessed at $470 billion and have been developing at 5% yearly. India has probably the most elevated thickness of retail outlets in the whole world. There are in excess of 12 million retail outlets (Indian counting chaotic ones) in the nation. Over the previous decade, there has been fast extension of composed retail designs. While half of India's populace is under 25 years of age, 70% is under 35 years old. The suggestion is that there is a huge supplement of youthful working populace, in this manner, bringing about expanded retail spending. The Indian market is very rewarding for worldwide parts in the retail area, and India has been set at second situation in AT Kearney's yearly Global Retail Development Index (GRDI) 2008. As the contemporary retail segment in India is reflected in rambling shopping plazas, multiplex-shopping centers and immense buildings offer shopping, diversion and food all under one rooftop, the idea of shopping has changed regarding arrangement and purchaser purchasing conduct, introducing an upset in shopping in India.

Emerging Organized Retail Formats in India: A portion of the developing retail organizes in India have been quickly clarified underneath:

Malls: Mall is biggest type of sorted out retailing today. Found primarily in metro urban communities, in nearness to urban edges they run from 60,000 sq ft to 7, 00,000 sq ft or more. They loan an ideal shopping involvement in a blend of item, administration and diversion, all under a typical rooftop. Models incorporate Shoppers Stop, Pyramid, and Pantaloon.

Speciality Stores: Focusing on explicit market portions and have set up themselves firmly in their divisions. Chains, for example, the Bangalore based Kids Kemp, the Mumbai books retailer Crossword, RPG's Music World and the Times Group's music chain Planet M are two or three models.

Discount Stores: As the name recommends, markdown stores or plant outlets, offer limits on the MRPthrough selling in mass arriving at economies of scale or abundance stock left over at the season. The item classification can extend from an assortment of transitory/durable products. Markdown Circuit is one such model.

Department Stores: Large stores running from 20000-50000 sq. ft, taking into account an assortment of customer needs. Further, they are characterized into restricted offices, for example, dress, toys, home, food supplies, and so on.

Hyper stores/Supermarkets: These are situated in or close to private high roads. These stores today add to 30% of all food and staple sorted out retail deals. Stores can additionally be arranged into smaller than usual markets regularly 1,000 sq ft to 2,000 sq ft and enormous stores going from of 3,500 sq ft to 5,000 sq ft. having a solid spotlight on food and staple and individual deals.

Review Of Literature

Purohit and Kavita agreeing there examines that the customary retailers are not a lot of clear about the outcomes of the cutting edge retailing the conventional retailers are netural or unsure, present day retailing will cut the overall revenue of the customary retailers; the advanced retailing will lead sound rivalry in the market, current retailing will lessen the business volume of the customary retailers and conventional retailers ought to improve client care administrations in the period of present day retailing. Hardwar and Makkar (2007) believe that NCR and Mumbai will keep on ruling the Indian retail scene. Both are huge and differing to oblige an assortment of new arrangements, including one-stop shopping centers, strength shopping centers, hyper markets and enormous box retailing. The analyst is of the view that auxiliary metros are seen by retailers as the "following retail objections" which toss a solid test to Mumbai and NCR Region. Pune, Bangalore, Kolkata, Hyderabad and Ahmadabad all have critical shopping center turn of events and are probably going to represent 33% of India's sorted out retail division. Factors, for example, developing pay and rising desires are expanding the interest for sorted out retailing. As per Cherish Mathew (2009), "Forceful development by composed retailing has, thus, advanced certain political, lawful and social issues, raising worries about the fate of customary/sloppy retailing. The retail structure in India expected to settle at another balance, obliging both the composed and disorderly retailer. As the administration's intercession in the retail business is probably going to decrease in future, client inclinations and market powers will decide the possible result. V Ramanathan (2009), the disorderly retailers should be receptive to the serious retail market elements made by the composed retail arranges so as to support their business and serve their objective clients in a gainful way. This 'class mur dering' approach would get basic for the proceeded with endurance of sloppy retailers. In the event that the sloppy retailers embrace this methodology, along with the different types of comfort that they effectively offer, they would have the option to face the opposition from the composed retail designs. Sanjeev Verma

(2007) read Consumer Preferences for Retail Store Selection in Mumbai. The investigation was attempted to comprehend the elements influencing customer inclinations for retail location determination and creating advertising systems towards addressing the requirements and needs of shoppers. This examination inspects the linkage between buyer inclinations and the significance of some notable store characteristics. Bricklayer et al (1994) recommended that sensible costs in a retail location actuate consumer loyalty just as fabricate client dedication. The investigation found that in the retailing segment, the store having sensible costs will regularly catch an enormous piece of the overall industry.

Gupta (2004) are of the view that buyers favour rising retail organizes because of its noteworthy item properties which incorporate item quality, combination of product, assortment and item costs.

Objectives Of The Study:

- To analyze consumer behaviour & consumption pattern
- To study the evolution Retailing in India
- To evaluate consumer perception with respect to organized and unorganized retailing.

Research Methodology:

The researcher moved toward the respondents actually with organized poll. The whole poll utilized for the review was partitioned into three sections. The information for the examination has been gathered through a study of retail shoppers. The specialist has utilized advantageous testing strategy. The non-likelihood arbitrary testing strategy dependent on the decisions of assessor has been utilized with the end goal of information assortment. The information has been gathered from different areas in Mumbai and Suburbs.50 Samples each has been chosen from Mumbai City and Suburbs. The example size of the examination is 100 respondents. Respondents who were happy to partake have been just approached to fill the survey. For gathering the essential information organized survey was utilized as an instrument and the poll chiefly placated questions which were shut finished. The Secondary information has been gathered from research paper, article, continuing of gatherings, Internet and so forth.

1 Limitations of the Study:

The study will have the following limitation:-

- The study is limited to Mumbai City and Suburbs only.
- The primary data has its own limitations and based on the respondent the study is limited to 2 districts of Maharashtra only and it cannot be applicable to the consumers of other parts of India.
- In the food and general merchandise category the study will be limited to three players which are Reliance Fresh, Big Bazaar and More.

Dataanalysis: In this section the data based on primary research will be has been analyzed with the help of bar graph.

5.1 Respondents Profile:

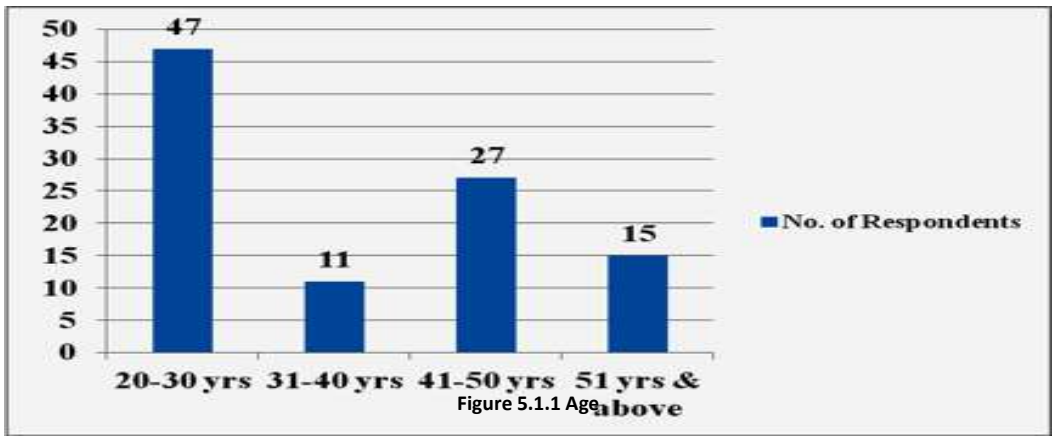

Figure 5.1.1 Age

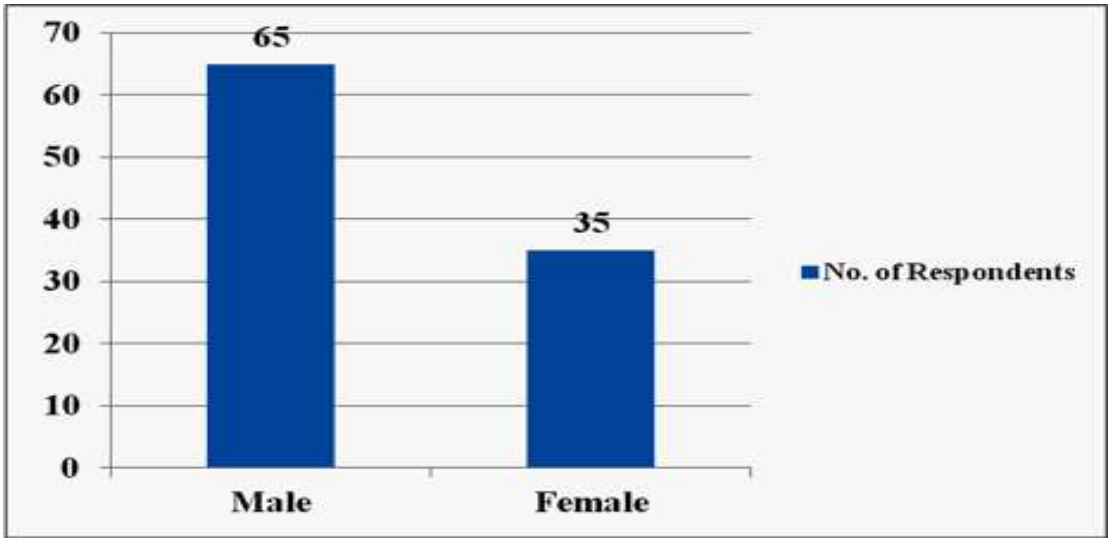
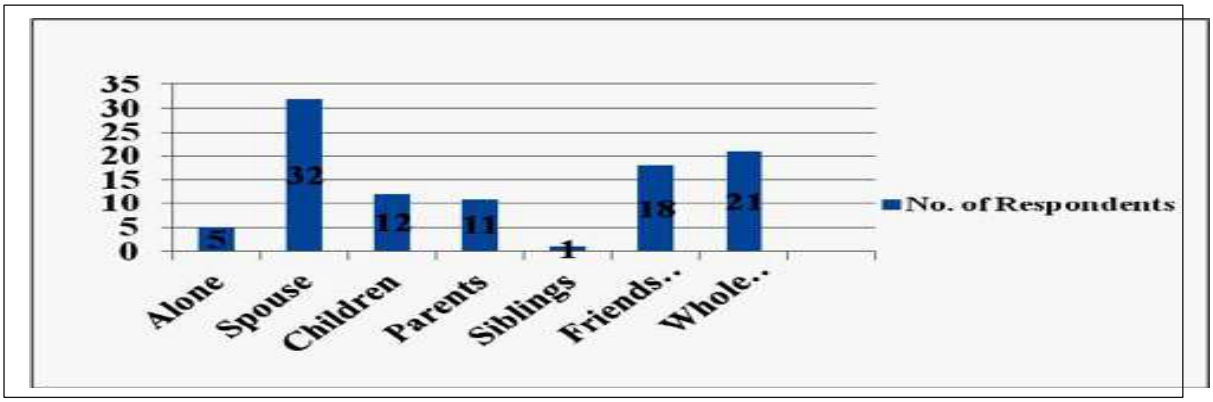
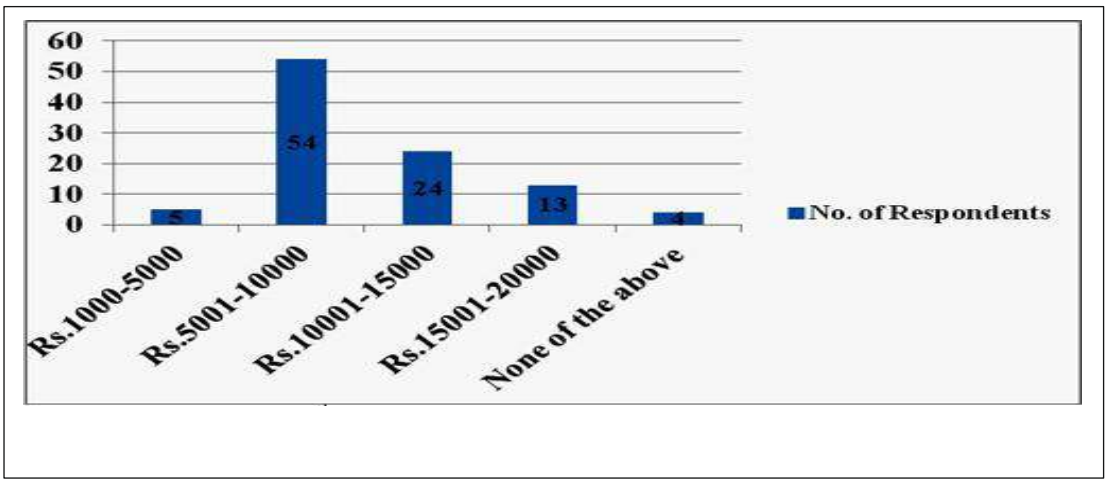
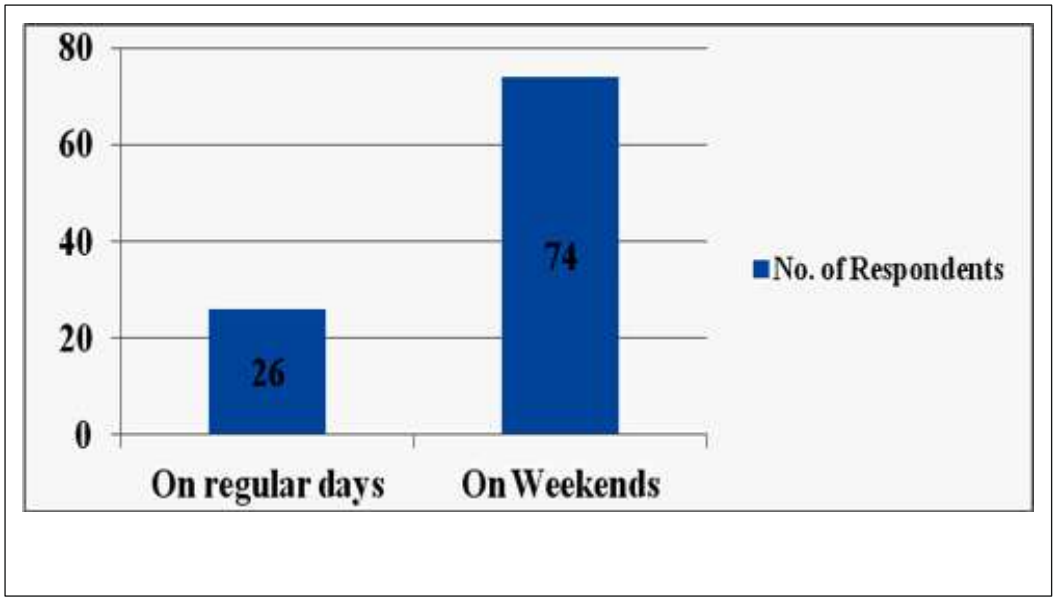
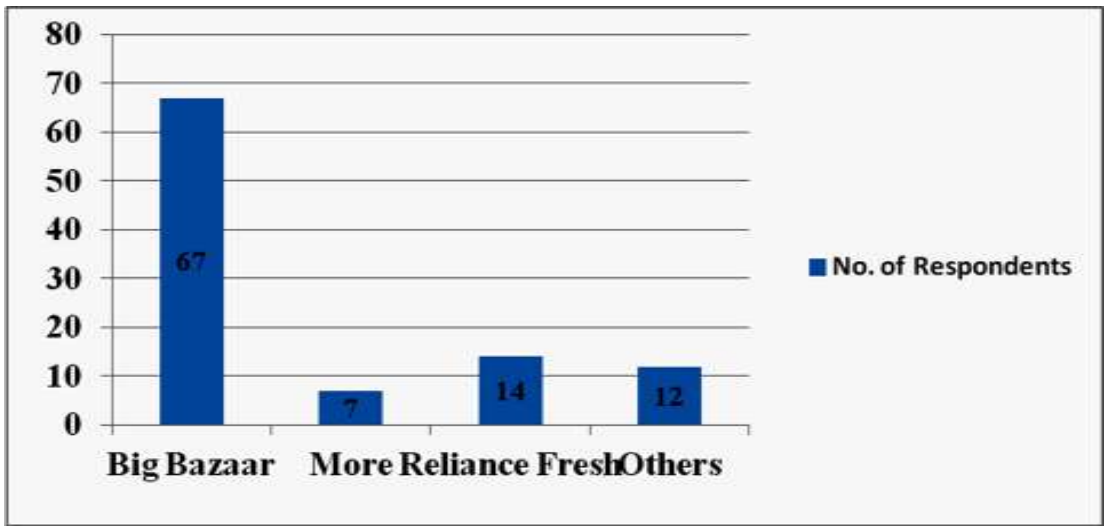


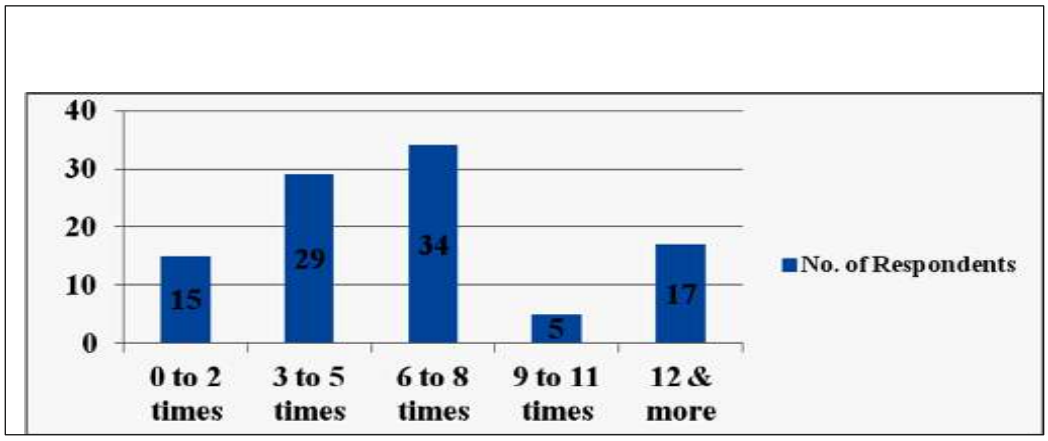




© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)







Findings:

1. Based on the above examination it has been discovered that 61% of the respondents visiting shopping center fall between the age gathering of 20-30 yrs. It very well may be surmised from the above finding that young want to shop at sorted out outlet when contrasted with individuals of developed and grown-up age gatherings.
2. 58% are male and 42% are female respondents. This implies guys are more disposed towards shopping when contrasted with the female respondents.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

3.Now individuals don't like to go for shopping alone as 32% of the respondent answered that they like to shop with their life accomplices followed 21% of the respondents who want to go with the whole family.

4. 77% of the respondents spend more than Rs. 10000 each month to month. This implies respondents living in these regions spend altogether which implies that the buyers have the buying power.

5. 54% of the respondents spend month to month on food and goods between a range Rs.5001-10000 followed by 24 respondents who spend between a scope of Rs.10001-15000 which is basic data from the retailer's point of view working in the food and grocery classification.

6. Overall 56% of the respondent wants to shop in excess of multiple times in a month which connotes an impressive footfall of the shoppers.

7. 74 % of the respondent answered that they like to shop on end of the week which is huge data from the retailer's point of view. The retailers need to chalk out systems so as to build the footfall on the normal days.

8. Majority of the respondents answered that they would like to purchase things like staple food, other food, stuffed nourishments, cooking oil, corrective thing, toiletries and family cleaning items at sorted out outlet which is acceptable sign for composed retailers and expanding support among the customers.

9. 74% of the respondents concur that because of sorted out retailing they are spending more during shopping which feature a move in buyer shopping example and effect of composed retailer.

10. 89% of the respondents concur that because of composed retailing an uncommon change has occurred in their utilization design/way of life. Additionally, it likewise reflects positive impression of purchasers concerning

composed retailers. 69% of the respondents had the option to review the name of Big Bazaar which is a critical number and plainly shows the strength of Big Bazaar in food and staple class.

Conclusions:

In view of the whole investigation it very well may be presumed that the Indian economy is developing and alongside it the Indian retail market is additionally developing. The development of India economy has offered ascend to another market condition which prefers the sorted out retailers. Notwithstanding, both current and conventional retailers will exist together in India for quite a while to come, as they two have their own upper hands. However, the territory of worry for sloppy retail ought to be that the shopper conduct is changing and they are eager to receive the shopping center culture the same western culture. As of now this pattern is restricted to greater urban areas, yet the pace which the sorted out retailers are growing; its impression will be felt in littler towns as well.

Acknowledgement

I would like to express my sincere gratitude to all those who have contributed directly or indirectly to the successful completion of this research study titled "A Comparative Study on Consumer Preferences and Buying Patterns between Organized and Unorganized Retail Formats in Maharashtra." The study examines consumer behaviour and perceptions regarding organized and unorganized retailing, based on primary data collected from 100 respondents from Mumbai City and its suburbs.

Abstract

The rapid development of artificial intelligence (AI) has created new opportunities for accelerating scientific research, particularly in materials science, medicinal chemistry, coordination chemistry, and sustainable chemical development. Azo dye-based metal complexes represent an important class of coordination compounds because of their diverse structural characteristics, tunable electronic properties, and potential biological activities. However, conventional synthesis and screening of such complexes can be time-consuming, resource-intensive, and dependent on extensive experimental trials. The integration of artificial intelligence and machine learning can provide an efficient approach for predicting molecular properties, optimizing synthesis conditions, and identifying compounds with enhanced antimicrobial potential. The present study proposes an AI-assisted framework for the sustainable development of azo dye-based metal complexes with antimicrobial properties. In this approach, molecular descriptors, structural characteristics, physicochemical properties, metal-ion characteristics, and experimentally determined antimicrobial data can be integrated into machine-learning models. These models can be trained to establish structure–activity relationships and predict the antimicrobial performance of newly designed complexes before their experimental synthesis. Such predictive modelling may help researchers prioritize promising compounds and reduce unnecessary laboratory experimentation. The proposed approach also supports the principles of green and sustainable chemistry by potentially reducing chemical consumption, solvent use, energy requirements, experimental repetitions, and laboratory waste. AI can further assist in optimizing reaction parameters such as temperature, reaction time, solvent, pH, reactant ratio, and catalyst concentration to improve yield and efficiency. The integration of AI with coordination chemistry can therefore contribute to the development of safer, more efficient, and environmentally responsible antimicrobial materials. The approach is particularly relevant to India's emerging digital scientific ecosystem, where AI-enabled research can support innovation, reduce research costs, and strengthen interdisciplinary collaboration between chemistry, computational science, biotechnology, and data science. The study concludes that AI should be viewed as a complementary tool to experimental chemistry rather than a replacement for laboratory validation. Combining computational prediction with synthesis, characterization, and antimicrobial evaluation can provide a powerful pathway for developing novel azo dye-based metal complexes while supporting sustainable scientific development.

Keywords: *Artificial Intelligence; Azo Dyes; Metal Complexes; Antimicrobial Activity; Machine Learning; Sustainable Chemistry*

Introduction

Azo compounds are characterized by the presence of an azo linkage (-N=N-) and constitute an important class of organic compounds with extensive applications in dyes, pigments, analytical chemistry, materials science, and biological research. The ability of azo ligands to coordinate with transition-metal ions provides opportunities for the formation of metal complexes with modified structural, electronic, and biological properties. Several metal complexes of azo ligands have been investigated for their potential antimicrobial activities against different microorganisms.

Quick Response Code:

Website: https://bnir.us

Despite their potential, the conventional discovery of biologically active metal complexes generally involves multiple stages, including ligand synthesis, metal complexation, purification, structural characterization, and biological screening. This process may require considerable time, chemicals, energy, and laboratory resources. There is therefore a growing need for approaches that can make chemical research more efficient and sustainable. Artificial intelligence and machine learning have emerged as powerful technologies for analyzing complex scientific datasets and predicting chemical and biological properties. AI-based models can identify relationships between molecular structure and biological activity, classify compounds, predict physicochemical properties, and assist in optimizing experimental conditions. In chemical research, these capabilities can reduce the number of experimental trials required for identifying promising compounds. The combination of AI with azo dye-based metal-complex research provides an interdisciplinary research opportunity. Molecular descriptors and experimental antimicrobial data can be used to develop predictive models, which may subsequently guide the design and selection of new complexes. Such an approach can contribute to sustainable chemistry by reducing experimental waste and improving resource efficiency. The proposed research therefore focuses on leveraging AI as a predictive and optimization tool for the sustainable development of azo dye-based metal complexes possessing potential antimicrobial properties.

Selection of the Research Topic

The research topic has been selected considering the growing importance of artificial intelligence in scientific research, increasing antimicrobial challenges, and the need for environmentally sustainable chemical technologies. Azo dye-based metal complexes provide a versatile platform for investigating structure, coordination behavior, and biological activity. Changes in the azo ligand structure, substituents, metal ions, coordination geometry, and physicochemical properties can influence the biological performance of the resulting complexes.

However, identifying the most promising complexes through conventional trial-and-error experimentation may require the synthesis and testing of a large number of compounds. AI offers an opportunity to analyze existing experimental data and predict the likely activity of new compounds. The topic is also aligned with the broader theme of "Empowering India's Digital Future through Artificial Intelligence." India is developing rapidly in areas such as AI, digital technologies, computational research, and interdisciplinary innovation. Applying AI to chemical research can demonstrate how digital technologies can contribute to scientific discovery and sustainable development.

Therefore, the selected topic integrates:

Artificial Intelligence + Machine Learning + Coordination Chemistry + Antimicrobial Research + Green Chemistry + Sustainable Development.

Objectives of the Research

The major objectives of the proposed research are:

1. To study the potential of artificial intelligence in the development of azo dye-based metal complexes.
2. To develop a computational framework for predicting the antimicrobial activity of azo dye-based metal complexes.
3. To identify relationships between molecular structure and antimicrobial properties using machine-learning techniques.
4. To investigate the influence of different metal ions and ligand structures on predicted antimicrobial activity.
5. To identify important molecular descriptors associated with antimicrobial performance.
6. To use AI-based optimization for selecting promising compounds for experimental synthesis.
7. To reduce unnecessary experimental trials, chemical consumption, and laboratory waste.
8. To support the principles of green and sustainable chemistry through AI-assisted chemical research.
9. To establish an interdisciplinary framework integrating chemistry, artificial intelligence, data science, and microbiology.
10. To propose an AI-assisted pathway for the future discovery of novel antimicrobial metal complexes in India.

Importance of the Research

1. The research can contribute to understanding the relationship between the chemical structure of azo dye-based metal complexes and their antimicrobial properties. AI-based analysis may identify molecular features that are difficult to detect through conventional approaches.
2. AI and machine learning can process large datasets containing molecular structures, physicochemical parameters, metal-ion characteristics, and antimicrobial activity. Predictive models can assist researchers in prioritizing compounds for experimental investigation.
3. Antimicrobial resistance is an important global public-health and scientific challenge. The discovery of new antimicrobial compounds

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

and materials is therefore an important research priority. Metal complexes provide a diverse chemical platform for investigating new antimicrobial candidates.

4. However, predicted antimicrobial activity should always be experimentally validated, and AI predictions should not be interpreted as proof of biological efficacy.
5. Traditional chemical research can generate considerable chemical waste and require substantial quantities of solvents, reagents, and energy. AI-assisted screening may reduce the number of compounds that need to be synthesized experimentally.
6. Thus, AI can potentially contribute to:

- Reduced chemical consumption
- Reduced solvent use
- Reduced laboratory waste
- Reduced energy consumption
- Improved experimental efficiency

7. AI-assisted compound screening can potentially reduce research and development costs by helping researchers identify promising candidates before undertaking extensive experimental synthesis and testing.
8. The research demonstrates a practical application of AI beyond conventional digital services. Integrating AI with chemistry can support India's transition toward a knowledge-based, technology-driven and innovation-oriented economy.

The approach can encourage collaboration among:

Universities → Chemical Scientists → AI Researchers → Biotechnology Laboratories → Pharmaceutical/Material Industries.

Proposed AI-Based Research Framework

The proposed research can follow the following conceptual pathway:

Collection of Experimental Data
↓
Azo Ligand and Metal Complex Database
↓
Molecular Descriptor Generation
↓
Data Pre-processing
↓
Machine-Learning Model Development
↓
Prediction of Antimicrobial Activity
↓
Selection of Promising Complexes
↓
Experimental Synthesis
↓
Structural Characterization
↓
Antimicrobial Evaluation
↓
Comparison of AI Predictions with Experimental Results
↓
Model Improvement and Optimization

Potential characterization techniques may include FTIR, UV–Visible spectroscopy, NMR spectroscopy, mass spectrometry, elemental analysis, magnetic measurements and other appropriate spectroscopic or structural techniques, depending on the specific complexes being studied.

Possible AI and Machine-Learning Approaches

Different computational approaches can be investigated, depending on the size and quality of the available dataset.

Supervised Learning

- Linear/Multiple Regression
- Random Forest
- Support Vector Machine
- Gradient Boosting
- Artificial Neural Networks

Classification Models

Antimicrobial activity can potentially be classified into categories such as:

High activity → Moderate activity → Low activity

Structure–Activity Relationship Analysis

AI can be used to identify relationships between:

Molecular structure → Physicochemical properties → Metal coordination → Antimicrobial activity

Model Evaluation

Models should be evaluated using appropriate statistical measures such as:

- Accuracy
- Precision
- Recall
- F1-score
- R^2
- Mean Absolute Error (MAE)
- Root Mean Square Error (RMSE)
- Cross-validation performance

The choice of metric should depend on whether the research treats antimicrobial activity as a classification or regression problem.

Expected Outcomes

The proposed research is expected to generate the following outcomes:

1. Development of an organized dataset of azo dye-based metal complexes.
2. Identification of molecular descriptors associated with antimicrobial activity.
3. Development of AI/ML models capable of predicting antimicrobial potential.
4. Identification of promising azo dye-metal combinations for experimental investigation.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

5. Reduction in unnecessary experimental synthesis.
6. Improved understanding of structure–activity relationships.
7. Development of an AI-assisted methodology for sustainable chemical research.
8. Integration of computational prediction with experimental chemistry.
9. Generation of research opportunities at the intersection of chemistry and artificial intelligence.
10. Development of a framework that may be adapted for other classes of biologically active coordination compounds.

Conclusion

The integration of artificial intelligence with the synthesis and biological evaluation of azo dye-based metal complexes represents a promising interdisciplinary research direction. Conventional chemical discovery often depends on repeated synthesis, characterization, and biological testing. AI and machine learning can complement this process by analyzing existing data and predicting the properties of new compounds. The proposed approach can help identify promising azo dye-based metal complexes before their experimental preparation. By reducing unnecessary experiments and optimizing chemical conditions, AI may contribute to more efficient and environmentally responsible research. The combination of AI-driven prediction, molecular design, experimental synthesis, characterization, and antimicrobial evaluation provides a comprehensive research framework. It can also contribute to the development of India's digital scientific ecosystem by demonstrating how AI can be applied to advanced chemical research. Nevertheless, AI predictions have limitations. Their reliability depends strongly on the quality, quantity, diversity, and representativeness of the training data. Therefore, computational predictions must be followed by appropriate experimental validation. Overall, the study demonstrates that AI can serve as a valuable decision-support and discovery tool in coordination chemistry. The integration of digital intelligence with sustainable chemical research has the potential to accelerate innovation while reducing resource consumption and experimental waste.

Suggestions and Recommendations

1. Establish standardized databases containing structural and antimicrobial data for metal complexes.
2. Encourage collaboration between chemists, microbiologists, AI specialists and data scientists.
3. Use experimentally validated datasets for developing machine-learning models.
4. Apply cross-validation and external validation to assess model reliability.
5. Give preference to interpretable AI methods wherever possible so that predicted relationships can be chemically understood.
6. Combine AI predictions with green-chemistry principles while selecting synthesis routes.
7. Reduce unnecessary synthesis by experimentally validating only high-priority computational candidates.
8. Develop secure and standardized digital platforms for sharing chemical and biological research data.
9. Encourage Indian universities and research institutions to develop AI-based scientific research laboratories.
10. Promote interdisciplinary education combining chemistry, artificial intelligence, machine learning and computational science.

Acknowledgement

I would like to express my sincere gratitude to all those who have contributed to the successful completion of this research work entitled "Leveraging Artificial Intelligence for Sustainable Development of Azo Dye-Based Metal Complexes with Antimicrobial Properties." First and foremost, I am deeply thankful to my research guide, teachers, and mentors for their valuable guidance, constructive suggestions, continuous encouragement, and academic support throughout the development of this study. Their insights helped me in understanding the interdisciplinary integration of artificial intelligence, machine learning, coordination chemistry, antimicrobial research, and sustainable chemistry.

Abstract

India's expanding gig economy is reshaping employment through platform-based work, flexibility platform-mediated control and limited financial resilience. This paper examines whether gig work can translate into genuine financial empowerment rather than digital access alone. It develops three core perspectives—freedom versus invisible control, digital inclusion versus financial resilience, and today's gig economy versus tomorrow's AI—supported by three additional dimensions concerning unpredictability, financial power and the hidden cost of waiting and availability. Using secondary evidence from NITI Aayog, the International Labour Organization, official financial sources and relevant research, the study analyses the relationship between gig work, financial inclusion and economic resilience. It argues that meaningful financial inclusion must extend beyond digital transactions towards financial security, worker agency, suitable financial products and long-term economic mobility, within the broader vision of Viksit Bharat @2047.

Keywords: *Gig Economy; Financial Inclusion; Financial Resilience; Platform Work; Digital Economy; Artificial Intelligence; Viksit Bharat @2047*

Introduction

India's gig economy has emerged as an important part of the country's changing labour market. Platform-based work in transportation, delivery, retail, home services and other activities has created employment opportunities outside the conventional employer–employee relationship. NITI Aayog estimated 7.7 million gig workers in India in 2020–21 and projected the workforce to reach 23.5 million by 2029–30 (NITI Aayog, 2022). The report also highlights the difficulty of accurately measuring this workforce because of data limitations and the changing nature of gig work. The expansion of gig work raises a question that is more fundamental than its size:

"Can gig work be truly empowering when freedom comes with uncertainty?" Gig work is often associated with flexibility and autonomy. Workers may have greater control over when they work and how they participate in the platform economy. Yet this freedom can coexist with less visible forms of control through ratings, incentives, task allocation and algorithmic systems. The first core perspective of this study therefore examines freedom versus invisible control. A second concern is the relationship between digital participation and financial security. Digital payments and platform-based earnings can connect workers to formal financial systems, but access alone does not guarantee the ability to manage irregular income or withstand financial shocks. This study therefore examines digital inclusion versus financial resilience as a second core perspective. The third core perspective looks towards the future of work. Artificial intelligence may reshape the tasks, skills and opportunities associated with platform-based employment.

The relevant question is consequently not only whether technology creates opportunities, but also who controls the technology, the data and the value generated through it. This forms the perspective of today's gig economy versus tomorrow's AI. Three supporting dimensions strengthen these core arguments. Flexibility versus unpredictability examines the difference between choosing when to work and knowing what one will earn. Financial visibility versus financial power considers whether the digital records generated through platform work actually improve workers' economic agency. The hidden cost of waiting and availability questions whether time spent travelling, waiting or remaining available for work is adequately reflected in conventional measures of earnings. Together, these perspectives shift the discussion from whether the gig economy creates employment to whether it creates sustainable economic opportunity. The study therefore connects gig work with financial inclusion, financial resilience and long-term economic mobility. This relationship is particularly relevant to Viksit Bharat @2047. A digitally transforming economy must not only expand participation in new forms of work but also enable workers to convert that participation into greater financial security and economic agency. The study consequently examines whether India's gig economy can move beyond digital access and flexible employment towards meaningful financial empowerment.

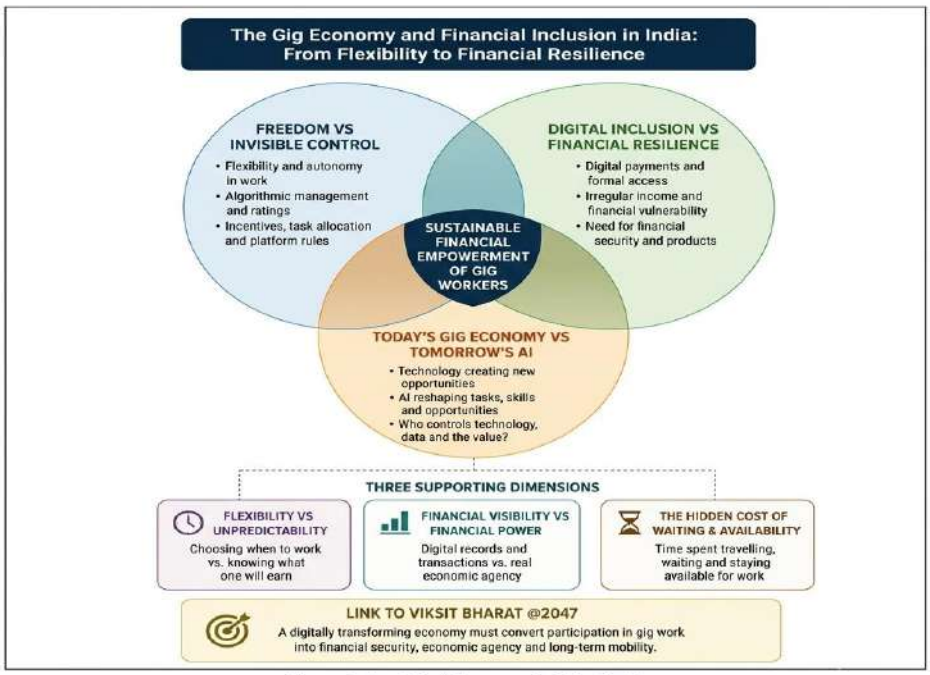

Figure 1: Analytical Framework of the Study
Note: *The diagram presents the three core perspectives and their intersection, supported by three dimensions, leading to the goal of sustainable financial empowerment in the context of Viksit Bharat @2047.*

Literature Review And Research Gap

Existing literature on the gig economy presents platform work as both an opportunity and a source of new forms of worker vulnerability. NITI Aayog's India-focused study highlights the employment potential of the gig and platform economy while also identifying challenges related to skills, social security and the measurement of gig work. Its estimate of 7.7 million gig workers in 2020–21, projected to reach 23.5 million by 2029–30, demonstrates the growing significance of this form of employment in India. The International Labour Organization similarly identifies flexibility, wider access to work and new income opportunities as important features of digital labour platforms. At the same time, its research highlights income volatility, limited access to social protection and the influence of algorithmic management on workers' autonomy. This literature suggests that the apparent freedom of platform work cannot be examined separately from the systems through which work is allocated, evaluated and controlled. The financial-inclusion literature provides a complementary perspective. The Reserve Bank of India defines financial inclusion in terms of affordable access to appropriate financial services, including savings and credit, rather than access to a bank account alone. For gig workers, whose earnings may be irregular, this distinction is

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

important because digital participation does not necessarily imply the capacity to manage financial shocks or build long-term financial security. Recent policy discussions in India have consequently placed greater emphasis on extending social protection to gig and platform workers. The ILO has noted the rapid expansion of this workforce and the need to address social-security gaps as platform work becomes a larger component of employment.

Research Gap

Existing studies have substantially examined the size of India's gig workforce, employment opportunities, working conditions, algorithmic management and social protection. However, these discussions are often considered separately. Less attention is given to how flexibility, platform control and digital financial participation interact to determine whether gig work produces genuine financial resilience. This study addresses that gap through an integrated framework. Rather than treating gig work simply as a new employment category, it examines the tension between freedom and invisible control, digital inclusion and financial resilience, and present platform work and future AI-driven work. It further considers three supporting dimensions—flexibility versus unpredictability, financial visibility versus financial power, and the hidden cost of waiting and availability.The study therefore shifts the central question from "How large is the gig economy?" to "Under what conditions can participation in the gig economy become a source of sustainable financial empowerment?" NITI Aayog's India-focused study highlights the employment potential of the gig and platform economy while also identifying challenges related to skills, social security and the measurement of gig work (NITI Aayog, 2022).

The International Labour Organization similarly identifies flexibility, wider access to work and new income opportunities as important features of digital labour platforms. At the same time, its research highlights income volatility, limited access to social protection and the influence of algorithmic management on workers' autonomy (International Labour Organization, 2021).The financial-inclusion literature provides a complementary perspective. The Reserve Bank of India defines financial inclusion in terms of affordable access to appropriate financial services, including savings and credit, rather than access to a bank account alone (Reserve Bank of India, 2021).

Methodology And Analytical Framework

Methodology

This study adopts a qualitative and analytical research design based on secondary data. Evidence is drawn from government reports, policy documents, international institutional publications, official financial-sector sources and relevant academic literature concerning the gig economy, digital platforms, financial inclusion and the future of work. The sources were selected based on their relevance to India's gig economy, financial inclusion, platform-based employment, social protection and technological change. The study focuses primarily on institutional and policy-based evidence to establish the broader context, while using existing research to interpret the implications for workers. The collected evidence is analysed thematically through the contrasting concepts developed in the analytical framework. Rather than statistically testing relationships, the study synthesises existing findings to identify recurring tensions between flexibility and control, digital access and financial resilience, and technological innovation and worker security. The study does not rely on primary surveys or interviews. Its contribution therefore lies in integrating existing evidence into a framework that examines whether participation in the gig economy can translate into sustainable financial empowerment and greater economic agency.

Analytical Framework

The first core perspective, Freedom versus Invisible Control, examines the tension between workers' apparent autonomy and the influence of platform ratings, incentives, task allocation and algorithmic systems. The second, Digital Inclusion versus Financial Resilience, distinguishes access to digital financial systems from the ability to manage irregular income, absorb financial shocks and build longer-term financial security. The third, Today's Gig Economy versus Tomorrow's AI, examines how artificial intelligence may reshape platform work and asks whether the benefits of technological change depend on who controls technology, data and the value generated from them. These core perspectives are supported by three additional dimensions: Flexibility versus Unpredictability, which examines the gap between control over working time and certainty of earnings; Financial Visibility versus Financial Power, which considers whether digital financial records translate into greater economic agency; and the Hidden Cost of Waiting and Availability, which examines forms of working time that may not be fully captured by conventional measures of earnings. The framework therefore treats financial resilience as the central outcome connecting employment conditions, digital participation and technological change. The

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

analysis ultimately asks whether the gig economy can move from providing access to work towards creating sustainable financial empowerment.

Main Analysis

1 Freedom Vs Invisible Control

Flexibility is one of the strongest attractions of gig work. Platform-based employment can lower entry barriers and allow workers to participate according to their availability. This apparent autonomy, however, needs to be examined alongside the mechanisms through which platforms organise and evaluate work. NITI Aayog identifies irregular wages, uncertain employment and algorithmic management as important challenges faced by platform workers. The central tension is therefore between freedom of participation and control within participation. A worker may decide when to log in, but the economic value of that choice can be influenced by task allocation, ratings, incentives, demand patterns and platform rules. The ILO identifies ratings and reputational systems as important elements of algorithmic management, with implications for workers' access to work, earnings and working time. This creates what may be described as invisible control. Unlike traditional employment, control does not necessarily appear through a direct supervisor or fixed workplace instruction. Instead, it can operate through the architecture of the platform itself. Decisions that affect a worker's opportunities may be experienced through an app, while the underlying criteria governing those decisions may remain difficult for the worker to understand. The financial implications are significant. When platform work becomes an important source of income, workers may respond to uncertainty by extending their availability or accepting conditions that they would otherwise prefer to avoid. The ILO's global evidence shows that algorithmic management can contribute to longer working hours and stress, while NITI Aayog highlights the pressure associated with irregular work and ratings-based evaluation. The issue, therefore, is not whether gig workers possess freedom at all. It is whether that freedom is accompanied by sufficient transparency and economic agency. Flexibility becomes meaningful only when workers can make informed choices without being excessively dependent on opaque systems that determine access to tasks, incentives or earnings. From a financial-inclusion perspective, this distinction is crucial. A worker may have a bank account, receive digital payments and technically choose working hours, yet still lack the economic stability required to save, manage unexpected expenses or plan for the future. Financial empowerment therefore requires more than digital access; it requires conditions under which workers can exercise genuine economic choice. The first core argument of this study is consequently that flexibility should not be treated as synonymous with empowerment The real measure of freedom in the gig economy lies in whether workers have transparency, predictable mechanisms of earning and sufficient economic agency to benefit from the flexibility that platforms provide.

2. Digital Inclusion Vs Financial Resilience

The expansion of digital payments has made participation in the formal financial system increasingly accessible to gig workers. Platform-based earnings can be transferred digitally, creating transaction records and reducing dependence on cash. However, digital participation should not automatically be interpreted as financial empowerment. The more important question is whether workers can use these financial connections to manage irregular earnings, access suitable credit, build savings and withstand economic shocks. This distinction is particularly important for gig workers because their income may fluctuate with demand, working hours, incentives and platform conditions. A worker may receive earnings digitally and maintain access to formal financial services while still having limited capacity to deal with an unexpected expense or a period of reduced work. Digital access therefore represents an entry point into financial inclusion, rather than its final outcome.

NITI Aayog's recommendations recognise this gap. Its 2022 report proposed improving institutional credit for platform workers and suggested leveraging FinTech and platform businesses to provide cash-flow-based lending rather than relying only on conventional collateral-based lending. This is significant because platform workers may generate regular digital transaction histories without possessing the conventional assets or employment documentation traditionally used to assess creditworthiness.

The distinction can therefore be expressed as:

Digital Inclusion = Access to digital financial systems

Financial Resilience = Capacity to use those systems to absorb shocks, manage income variability and plan for the future The second is substantially broader. A financially resilient worker should be able to manage fluctuations in earnings without immediately falling into severe financial stress. This requires more than a bank account or digital payment mechanism. It requires appropriate savings instruments, accessible and responsible

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

credit, insurance or social protection, financial literacy and mechanisms that recognise the nature of irregular platform income. The issue also has implications for the design of financial products. Conventional financial systems often evaluate borrowers through stable income, formal employment and collateral. Gig workers may not fit these categories even when they have observable transaction histories. The digital footprint created through platform work could therefore become a source of financial visibility, but only if financial institutions are able to interpret it responsibly and convert it into suitable products. This creates an important difference between visibility and resilience. Digital records may make a worker more visible to financial institutions, but visibility alone does not guarantee financial power. If access to credit is expensive, unsuitable or unavailable during periods of income volatility, digital inclusion may remain largely transactional. The core argument of this section is therefore that India's financial-inclusion agenda for gig workers must move from access to outcomes. The success of digital financial inclusion should not be measured only by how many workers receive digital payments, but also by whether those workers gain greater capacity to save, borrow responsibly, manage shocks and plan for the future.

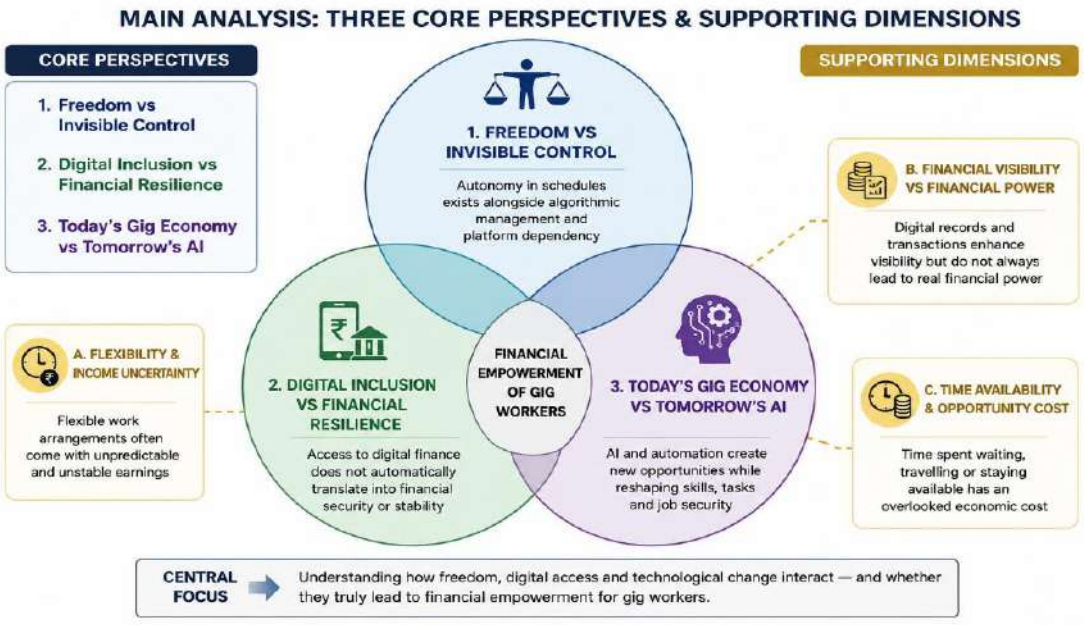
For the gig economy to become genuinely empowering, digital participation must ultimately translate into financial resilience. Only then can technology-supported access to work become a pathway towards sustained economic security rather than simply a more efficient method of receiving uncertain income.

4 Supporting Dimensions

3. Today's Gig Economy Vs Tomorrow's Ai

The gig economy is increasingly shaped by artificial intelligence (AI), automation and data-driven platforms. Today's gig work offers flexible, task-based employment with variable income, but technological change is likely to reshape the nature of these opportunities. AI can automate routine tasks, improve worker–customer matching and create new forms of skilled work. At the same time, changing algorithms and higher skill requirements may increase workers' dependence on platforms and make continuous upskilling necessary. NITI Aayog identifies skill development and platform-led skilling as important for preparing gig workers for technological change. (NITI Aayog, 2022) The financial impact of this transition is equally important. If work opportunities and earnings change with technology, financial inclusion must extend beyond digital payments towards the ability to manage income fluctuations and future disruptions. Financial resilience therefore becomes the bridge between technological participation and genuine economic security. The central argument is that AI should not be judged only by the efficiency it creates. Its success should also be measured by whether workers can adapt to technological change while retaining financial security and economic agency. Skills, transparent platform practices, suitable financial products and social protection can help ensure that technological progress strengthens rather than weakens the position of gig workers.

Figure 2 illustrates this transition from today's gig economy through AI-driven change and changing work requirements towards financial resilience.



© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

The three supporting dimensions highlight the less visible factors that influence the quality of gig work: uncertainty of earnings, the conversion of digital records into financial power, and the economic value of time spent waiting or remaining available. Together, they strengthen the study's central argument that flexibility and digital access alone are insufficient indicators of financial empowerment.

Figure 3. Supporting Dimensions of Gig Work and Financial Resilience

Source: Author's conceptualisation based on secondary literature.

Original Analyses

1 The Flexibility–Resilience Paradox

The evidence discussed above reveals a central paradox in gig work: the same flexibility that makes platform employment attractive can also increase financial vulnerability. A worker who can choose when to work may respond to uncertain demand by extending availability, accepting additional tasks or working during less favourable periods. Flexibility therefore provides control over time without necessarily providing control over financial outcomes. This creates an important distinction between short-term autonomy and long-term resilience. Short-term autonomy concerns the ability to decide when to participate in work, whereas financial resilience concerns the ability to withstand income fluctuations and plan beyond the immediate earning cycle. A gig worker may possess the first without possessing the second. The paradox becomes stronger when digital platforms become the primary source of income. Greater dependence on platform earnings can reduce the practical freedom to reject tasks or remain offline, even when workers formally retain that choice. Thus, economic dependence can gradually transform voluntary flexibility into necessity-driven availability. The study therefore proposes that flexibility should be evaluated not by the number of choices available to workers, but by the quality of outcomes those choices produce. Flexibility becomes economically empowering only when it is supported by sufficient financial resilience. This perspective shifts the discussion from "How much freedom does gig work provide?" to a more meaningful question: "Does that freedom increase a worker's capacity to withstand uncertainty and make independent financial decisions?"

2 The Digital Visibility–Economic Agency Gap

Digital platforms generate something that traditional informal work often does not: a continuous digital record of transactions, work activity and earnings. This creates greater financial visibility for gig workers. However, visibility should not be confused with economic agency. A worker may have a clear digital history of earnings but still face difficulty accessing suitable credit, building savings or protecting income against unexpected disruptions. The existence of data therefore does not automatically improve the worker's financial position. What matters is whether that data can be responsibly converted into meaningful financial opportunities. This gap is likely to become more important as AI-driven platforms expand. Greater use of algorithms may

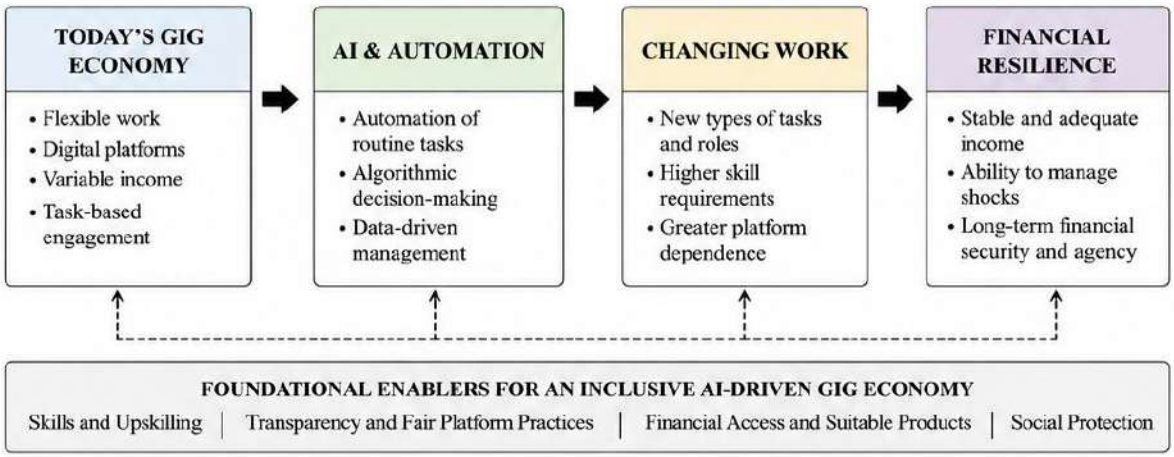


Figure 2. From Platform Work to AI-Driven Employment and Financial Resilience

Source: Author's conceptualisation based on secondary literature.

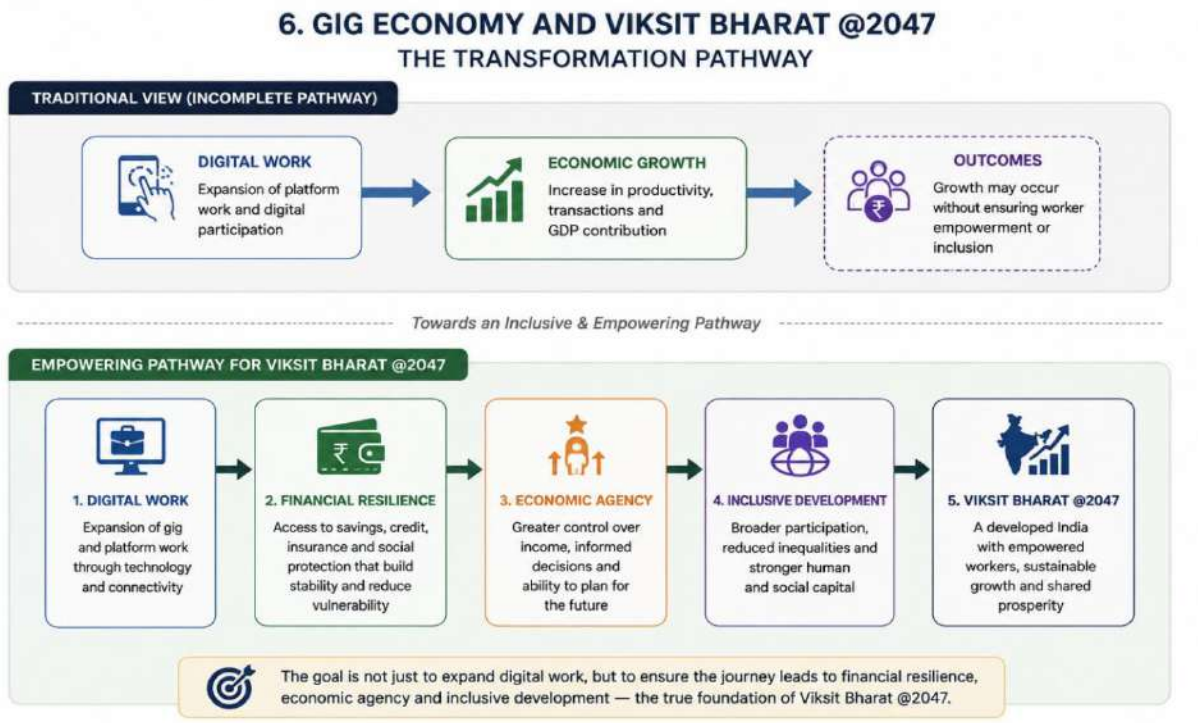
© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

generate more information about workers while simultaneously increasing the distance between workers and the decisions affecting their opportunities. Data can therefore create visibility for institutions and platforms without necessarily creating greater power for workers. The study identifies this as a Digital Visibility–Economic Agency Gap. Closing this gap requires financial institutions and platforms to move beyond collecting worker data towards creating transparent, suitable and responsible pathways to savings, credit, insurance and other forms of financial protection. The broader implication is that India's digital economy should be evaluated not only by how much data it generates or how many transactions it processes, but by whether that digital infrastructure increases workers' capacity to make informed and independent economic decisions.

Gig Economy And Viksit Bharat @2047

The gig economy can contribute to India's development by expanding access to employment, enabling digital participation and creating new forms of income generation. However, its contribution to Viksit Bharat @2047 depends on whether workers can convert participation in the digital economy into sustained economic security.

The analysis in this study shows that employment flexibility, digital financial access and technological innovation do not automatically produce empowerment. Uncertain earnings, invisible platform control and changing skill requirements can limit the benefits of gig work when workers lack adequate financial resilience and social protection.A developed digital economy must therefore be measured not only through technological expansion but also through the quality of economic opportunities it creates. For gig workers, this means strengthening access to appropriate financial services, portable social protection, skill development and transparent platform practices. The gig economy can become an important component of Viksit Bharat @2047 when technology is used not merely to increase efficiency, but to expand workers' economic agency. The transition towards an AI-enabled economy should consequently be accompanied by policies that allow workers to adapt, remain financially secure and participate meaningfully in the value created by digital transformation. Thus, the path from gig work to a developed India is not simply:



7. Policy Recommendations

The analysis suggests that strengthening the gig economy requires policies that move beyond employment creation and digital access towards financial resilience and worker agency.

1. Develop Gig-Specific Financial Products

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Financial institutions should develop savings, credit, insurance and emergency-finance products suited to workers with irregular platform earnings. Digital transaction histories can be used responsibly to assess cash flows, reducing excessive dependence on conventional indicators such as fixed salaries and collateral.

2. Strengthen Portable Social Protection

Social-security mechanisms should remain accessible when workers move between platforms or combine multiple forms of gig work. Portability can reduce the financial vulnerability created by irregular employment and frequent changes in platform participation.

3. Improve Platform Transparency

Platforms should provide greater clarity regarding ratings, incentives, task allocation and other systems that influence workers' opportunities and earnings. Greater transparency would reduce the gap between formal flexibility and invisible control.

4. Invest In Future-Ready Skills

As AI and automation reshape platform work, continuous skill development should become an integral part of the gig economy. Training should focus not only on current platform requirements but also on transferable digital, technical and financial skills that improve workers' ability to adapt.

5. Recognise Financial Resilience As A Policy Outcome

Financial inclusion programmes should evaluate outcomes beyond account ownership and digital transactions. Measures such as savings capacity, access to suitable credit, insurance coverage and the ability to manage income shocks can provide a more meaningful assessment of financial inclusion among gig workers.

6. Build Worker-Centric Digital Governance

Future platform regulation should balance technological efficiency with worker welfare. Policymaking should ensure that the benefits of data and AI-driven systems are not concentrated entirely at the platform level, but contribute to greater transparency, opportunity and economic agency for workers.

Together, these measures can help transform gig work from a source of flexible income into a more resilient component of India's digital economy and its broader Viksit Bharat @2047 vision.

Conclusion

India's gig economy represents an important shift in the structure of employment, creating new opportunities through digital platforms while also introducing new forms of economic uncertainty. The analysis shows that flexibility and digital access, although valuable, do not automatically result in financial empowerment. The three core perspectives developed in this study highlight the central tensions within platform work. Freedom can coexist with invisible control, digital inclusion can exist without financial resilience, and technological progress can create both opportunities and uncertainty for workers as AI reshapes the future of employment. The supporting dimensions further demonstrate that flexibility may involve unpredictable earnings, financial visibility may not translate into financial power, and time spent waiting or remaining available can carry an overlooked economic cost. The study therefore answers its central question with a qualified conclusion: The future of the gig economy will ultimately depend not only on how efficiently technology creates and allocates work, but on whether that technology enables workers to build greater financial resilience, stronger economic agency and more sustainable livelihoods. Digital participation must be accompanied by appropriate financial services, social protection and opportunities for continuous skill development. For Viksit Bharat @2047, the objective should not be simply to expand the digital workforce. The larger goal should be to ensure that technological and economic transformation improves the capacity of workers to withstand uncertainty, adapt to change and participate meaningfully in future growth. The future of the gig economy will ultimately depend not only on how efficiently technology creates and allocates work, but on whether that technology helps workers build greater financial resilience, stronger economic agency and more sustainable livelihoods.

Acknowledgement

I would like to express my sincere gratitude to all those who have supported and encouraged me in the completion of this research paper titled "The Gig Economy and Financial Inclusion in India: From Flexibility to Financial Resilience." The study examines the relationship between gig work, financial inclusion, financial resilience, technological change, and the broader vision of Viksit Bharat @2047. I am deeply thankful to the various government institutions, international organisations, financial-sector institutions, and researchers whose reports, policy documents, and scholarly contributions provided the essential secondary evidence for this study.

Abstract

Karnataka is rich in various tourism assets like cultural, religious, environmental, animal, seaside, heritage, rural, and metropolitan. Unequal geographical distribution results in inequality in infrastructure, accessibility and regional tourism growth. Much of the earlier work had been concerned with local sites and access. The present study has made a detailed study of the tourism-resource pattern in the 31 districts and four administrative divisions of Karnataka. Using geographic information systems (GIS) technology and descriptive statistical analysis, this study investigates the district and divisional level dispersion of chosen tourist attractions throughout Karnataka. Using Microsoft Excel, a database of 347 tourist locations was developed, geocoded, and linked to the 31 districts and four administrative divisions of the state. The district wise totals were added to ascertain divisional totals, percentage shares, mean destinations per district, standard deviation and regional rankings. The outcomes show the 108 sites representing 31.1% of the state inventory, Mysuru Division had the most tourist destinations, then came Bengaluru Division with 85 destinations (24.5%), Belagavi Division with 80 (23.1%), and Kalaburagi Division with 74 (21.3%). With an average of 12 destinations per district, Mysuru topped the list. Kalaburagi and Bengaluru followed with averages of roughly 10.6 destinations. Mysuru shows the most balanced district level distribution, Belagavi shows the higher internal fluctuation. Leading districts were indicated as Uttara Kannada, Bengaluru Urban, and Mysuru, with 16, 15, and 14 tourism sites respectively. The findings highlight small regional variations and reinforce the need to strengthen inter-district linkages, promote the destinations, develop infrastructure and plan tourism circuits in an integrated manner to enable more balanced development of tourism in Karnataka.

Keywords: *Tourism resources, Karnataka, GIS, administrative divisions, regional disparity, tourism planning.*

Introduction:

The Tourism involves people traveling their places to outside of the environment. They live for various reasons such as recreation, religion, culture, and for business, personal reasons (UNWTO, 2021). From the geographical perspective, tourism grows through the connection between attractions, transport networks, accommodation, settlements, visitor-generating regions, and supporting infrastructure (Smith, 1993; Scott & Lemieux, 2010; Hu et al., 2021; Parmeshwari et al., 2021). A GIS-based tourism database is very useful for comparing tourism development between regions. It can reveal districts with high concentrations of attractions and areas where tourism resources are scattered, poorly connected, and insufficiently promoted. These spatial differences are often difficult to identify through conventional statistical tables alone. GIS therefore provides a stronger basis for understanding regional tourism inequalities and for planning more balanced tourism development. Previous studies demonstrate the usefulness of geospatial methods in tourism planning.

Website: https://bnir.us

GIS and multicriteria approaches have been applied to identify suitable ecotourism areas by integrating terrain, wildlife, roads, settlements, cultural resources, and tourism facilities (Bunruamkaew & Murayama, 2011; Çetinkaya et al., 2018). In India, remote sensing and GIS have been used to relate tourism potential to environmental, administrative, and infrastructural conditions (Acharya et al., 2022). Other studies have employed tourism-resource mapping, gap analysis, network analysis, and spatial-association methods to identify resource-rich areas, underdeveloped destinations, and opportunities for regional tourism cooperation (Van der Merwe & Van Niekerk, 2013; Ruda, 2016; Kang et al., 2018; Liu et al., 2017). These studies show that geospatial analysis, can be support tourism planning by revealing regional concentrations, imbalances, and relationships among neighboring destinations. Administrative-scale analysis is very important because tourism policies, infrastructure investments, development programs and others are commonly implemented through districts and regional administrative units. District-level studies have identified geographical disparities and the influence of administrative centers on tourism-resource distribution (Zhang et al., 2023; Ding et al., 2024; Liang et al., 2024).Such studies reveal that the basic statewide count of tourist destinations might cover significant internal variation. While lesser divisions could have a higher average number of destinations per district, divisions with more districts might show more total. Divisional totals so ought to be seen along with regional rankings, variation, district-level averages, and percentage shares. Relatively little study has systematically gathered geocoded tourist sites and contrasted their numerical distribution across all state districts and administrative levels. To find places with somewhat high concentrations of tourist attractions, divisions with less representation, regional tourism networks, we must conduct district-wise and division-wise analysis. The study objectives are 1. map the locations of official tourist destinations throughout Karnataka. 2. Compare division level totals and percentage shares with those of the district. 3. Describe with descriptive statistics variance and regional differences, 4. Find places with less concentration and more tourism resources. The results are meant to help Karnataka's inter-district tourism-circuit development, infrastructure prioritizing, destination marketing, and more balanced regional travel planning.

Study Area:

In India, Karnataka covers 191,791 square kilometers. It spans longitudes of 74° E to 78°30' E and latitudes of 11°30' N to 18°30' N. Maharashtra and Goa to the north, Telangana and Andhra Pradesh to the east, Tamil Nadu and Kerala to the south, and the Arabian Sea to the west define it in three primary physical zones.

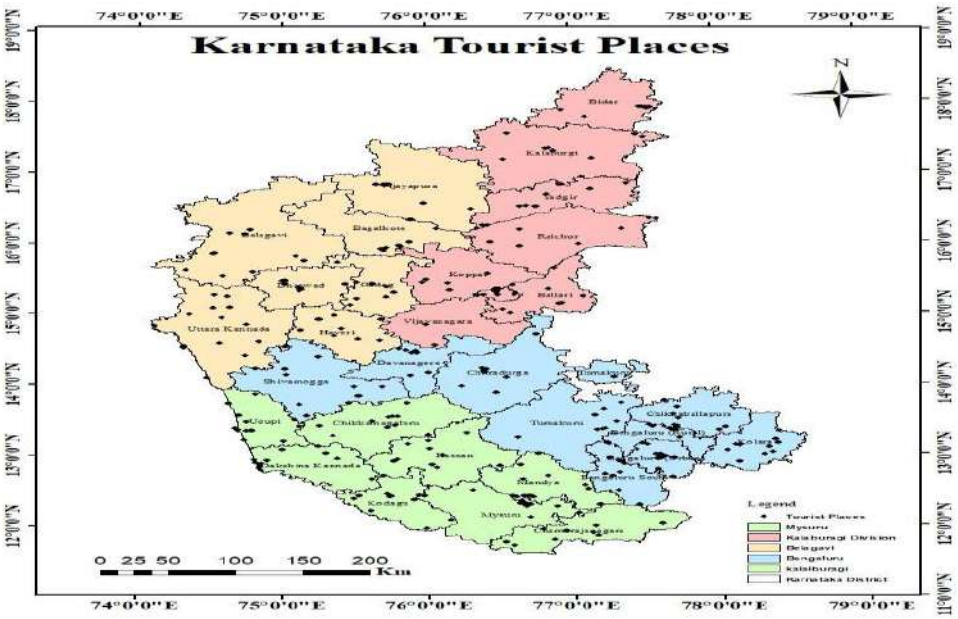
Website: https://bnir.us



The differences in geographical locations varies results in many natural settings, ecosystems, settlements, and cultural areas that enable several kinds of travel. Department of Tourism, Karnataka shows the wide range of tourist resources, including as historic sites and buildings, religious sites, forts, monuments, beaches, waterfalls, hill stations, woods, wildlife reserves, cultural scenery, and urban attractions. Official tourism data highlights sites spanning coastal, spiritual, cultural, nature-based, metropolitan, and the UNESCO heritage landscapes of Hampi and Pattadakal spread over Karnataka. (Karnataka Tourism) The Karnataka Tourism Policy also acknowledges the variety of topography and culture within the state and encourages the creation of many tourist themes, focal areas, and data-driven travel planning. Karnataka has been investigated this study using its 31 districts and four administrative divisions. The divisions are Belagavi, Kalaburagi, Bengaluru, and Mysuru. Mysuru Division has nine districts, Bengaluru Division has eight, and Belagavi and Kalaburagi divisions each have seven. A database of 347 chosen travel destinations was created and given to their own administrative area and district. Following Bengaluru's 85, Belagavi's 80, and Kalaburagi's 74, Mysuru Division has 108 noted tourism sites.

Methodology:

A quantitative descriptive approach was adopted to compare the spatial distribution of tourism resources across Karnataka's four administrative divisions: Belagavi, Kalaburagi, Bengaluru, and Mysuru. The tourism-destination database was compiled in Microsoft Excel and each destination was assigned to its corresponding district and administrative division. District-wise destination counts were aggregated to obtain the total number of tourist places in each division. Divisional percentage share was calculated by dividing the number of tourist places in each division by the statewide total of 347 destinations and multiplying by 100. Because the divisions contain different numbers of districts, the mean number of tourist places per district was also computed to support standardized comparison. The divisions were ranked according to total destinations, percentage share, and district-level average. To evaluate regional inequality, the difference between the greatest and lowest divisional totals was investigated. Separate maps for the four divisions were created using GIS. maps show district boundaries, tourist-place locations, and district-wise destination totals.

$$\text{Divisional Share} = \frac{Tourist\ places\ in\ a\ division}{347} * 100$$

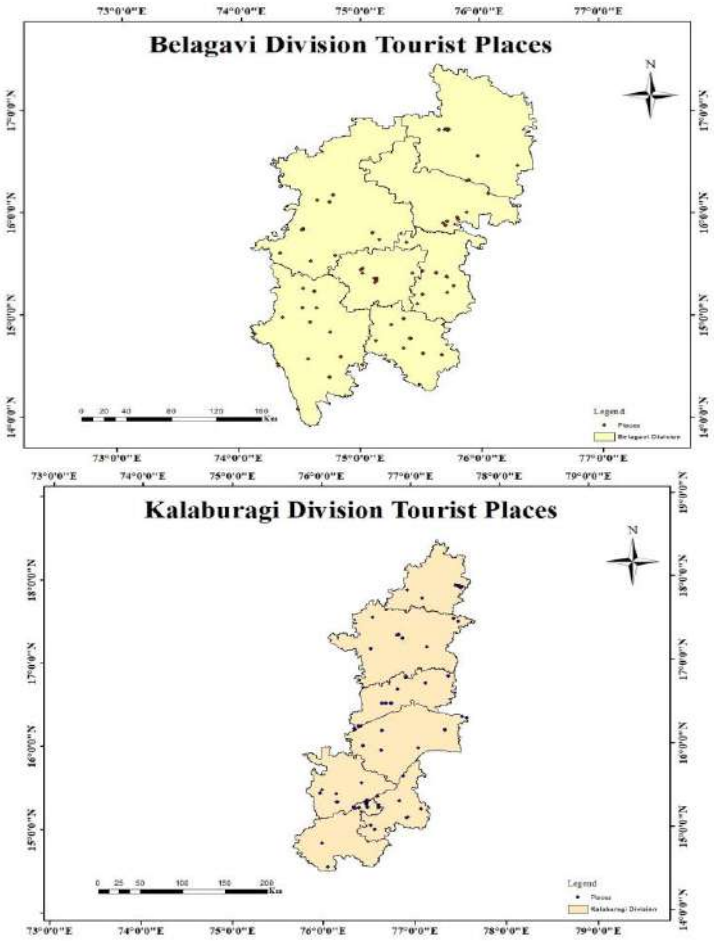
$$\text{Average per District} = \frac{\text{Total tourist places in a division}}{\text{Number of districts}} * 100$$

Results and discussion:

Belagavi Division: Belagavi Division: The Uttara Kannada district has 16 destinations. Belagavi and Vijayapura are following with 12 destinations

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

apiece, highlighting their significance as key cultural and historical tourism centers. Bagalkote, Dharwad, Gadag and Haveri each have 10 destinations, showing a very equitable secondary spread over the remaining districts Although the division's tourism base is diverse overall, the presence of dominant regional tourism nodes is indicated by the higher concentration in Uttara Kannada, Belagavi, and Vijayapura. While the lower-count districts need stronger destination advertising, transit connectivity, visitor facilities, and thematic integration to ensure more balanced tourism development throughout the division, these districts may act as anchors for inter-district tourism circuits.



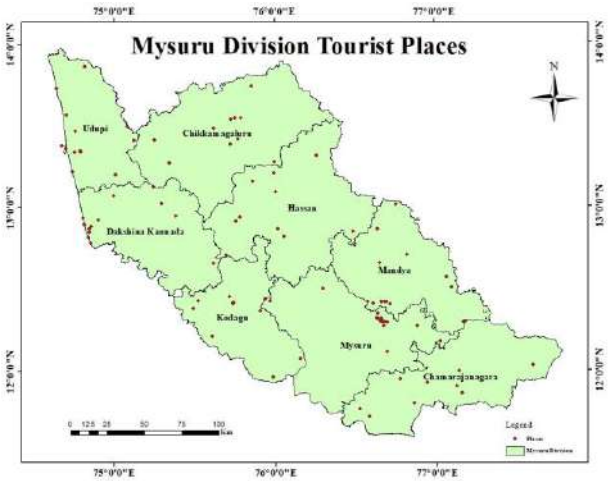
Kalaburagi Division: The Kalaburagi Division has 74 tourist places that have been identified spread across seven districts. This is the number of tourism resources when compared to the four administrative divisions in Karnataka. Kalaburagi and Vijayanagara each have 12 destinations. This shows that these two places are very important for heritage and archaeological tourism. The other districts are Bidar, Raichur, Yadgiri, Ballari and Koppala have each have 10 tourist places. This shows that the resources are spread out in a way that's not too uneven but also not very high. The division has cultural and historical places. These include monuments, forts, temples and even areas that are recognized by UNESCO. However, the total number of places suggests that many of them are not being used much as they could be when compared to other divisions. Tourism planning is really important. We need to have roads tell people about the great places to visit make it easy for them to get there and have tours that show them the local history and culture. The northeastern region of Karnataka needs to have these plans in place. This way tourism, in Karnataka will grow in a way and everything will be okay. Tourism planning will help the northeastern region of Karnataka and tourism will grow in a way.

Bengaluru Division: There are 85 known tourist attractions in the Bengaluru Division. These tourist attractions are spread over eight districts. Bengaluru Urban has a lot of tourist attractions. It

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

has 15 tourist attractions. This is 17.6 percent of the total tourist attractions in the Bengaluru Division. Bengaluru Urban has a lot of heritage sites and museums. It also has institutions and urban recreational facilities. Every district boasts about ten tourist destinations. Bengaluru Rural, Ramanagara, Kolar, Chikkaballapur, Tumakuru, Chitradurga, and Davanagere are among these districts. This suggests that every one of these areas have 11.8 percent of all the tourist attractions. The Bengaluru Division has a center for tourism. This center is Bengaluru Urban. The areas around Bengaluru Urban have tourist attractions. They are not as varied as the ones in Bengaluru Urban. If we connect Bengaluru Urban with the areas around it we can spread out the tourists. This can help reduce the number of tourists in the city. We can improve the roads. Promote the tourist attractions. We can also provide facilities for the tourists. There are 85 tourist attractions in the Bengaluru Division. They are spread over 8 districts. Most of the tourist attractions are in Bengaluru Urban. There are 15 tourist attractions, in this area. They include museums and heritage sites. The other districts have around 10 tourist attractions each.

Mysuru Division: The Mysuru Division has 108 tourist attractions. These are spread over nine districts. It has the most tourist attractions. Mysuru has the tourist attractions in one district. There are fourteen tourist attractions in Mysuru. Other districts like Mandya and Hassan have twelve tourist attractions each. Kodagu and Shivamogga also have twelve tourist attractions each. Chikkamagaluru and Udupi have twelve tourist attractions too.



Dakshina Kannada has twelve tourist attractions well. Chamarajanagar has 10 tourist attractions. The number of tourist attractions is the same in all districts. This means that tourist attractions are spread out and not just in one place. The Mysuru Division is good for tourism because it has a lot of things to offer. The Mysuru Division has heritage and pilgrimage sites. It also has mountains and wildlife and seaside areas. The Mysuru Division has recreational things to do. The districts near Mysuru have tourist attractions too. Mysuru is the main place for tourism, in the area. To make tourism better the districts need to be connected. The tourist attractions need to be promoted in a way. The tourist infrastructure needs to be improved. The tourist attractions need to be planned in a circuit. This will help the Mysuru Division become a tourist place. It will also help spread the benefits of tourism to parts of Karnataka.

Overall Comparison of the Four Administrative Divisions

Karnataka has a lot of tourist destinations 347 to be exact. These tourist destinations are not evenly spread out across Karnataka's four regions. Mysuru Division has the tourist destinations with 108 sites, which is 31.1% of the total. This shows that Mysuru Division has a lot of history nice coastal areas, hills and animals that people like to visit. Bengaluru Division is next with 85 tourist destinations, which's 24.5% of the total. People like to visit Bengaluru Division because it has a city and a lot of heritage and recreational sites. Belagavi Division has 80 tourist destinations, which's 23.1% of the total. These tourist destinations include historical sites, waterfalls and nice places to visit in the countryside. Kalaburagi Division has the number of tourist destinations with only 74, which is 21.3% of the total. This means that Kalaburagi Division has a

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

lot of room to grow and develop its tourist attractions. If we look at the average number of tourist destinations per district Mysuru Division is still the top with 12 destinations per district. Belagavi Division is next with 11.4 then Bengaluru Division and Kalaburagi Division are tied with 10.6. The difference between the division with the tourist destinations and the one, with the least is 34 locations. This is not a difference so it means that the tourist destinations are pretty evenly spread out across Karnataka. Mysuru Division has the tourist destinations but Kalaburagi Division has fewer. However just looking at the number of tourist destinations is not enough to know how well tourism is doing in each region. We also need to think about how easy it's to get to these places what kind of tourist infrastructure is available how many different types of tourist destinations there are and how good the quality of these destinations is. All these things are important when we are trying to figure out how tourism is growing in each region of Karnataka.

Abstract

Karnataka is rich in various tourism assets like cultural, religious, environmental, animal, seaside, heritage, rural, and metropolitan. Unequal geographical distribution results in inequality in infrastructure, accessibility and regional tourism growth. Much of the earlier work had been concerned with local sites and access. The present study has made a detailed study of the tourism-resource pattern in the 31 districts and four administrative divisions of Karnataka. Using geographic information systems (GIS) technology and descriptive statistical analysis, this study investigates the district and divisional level dispersion of chosen tourist attractions throughout Karnataka. Using Microsoft Excel, a database of 347 tourist locations was developed, geocoded, and linked to the 31 districts and four administrative divisions of the state. The district wise totals were added to ascertain divisional totals, percentage shares, mean destinations per district, standard deviation and regional rankings. The outcomes show the 108 sites representing 31.1% of the state inventory, Mysuru Division had the most tourist destinations, then came Bengaluru Division with 85 destinations (24.5%), Belagavi Division with 80 (23.1%), and Kalaburagi Division with 74 (21.3%). With an average of 12 destinations per district, Mysuru topped the list. Kalaburagi and Bengaluru followed with averages of roughly 10.6 destinations. Mysuru shows the most balanced district level distribution, Belagavi shows the higher internal fluctuation. Leading districts were indicated as Uttara Kannada, Bengaluru Urban, and Mysuru, with 16, 15, and 14 tourism sites respectively. The findings highlight small regional variations and reinforce the need to strengthen inter-district linkages, promote the destinations, develop infrastructure and plan tourism circuits in an integrated manner to enable more balanced development of tourism in Karnataka.

Keywords: *Tourism resources, Karnataka, GIS, administrative divisions, regional disparity, tourism planning.*

Introduction:

The Tourism involves people traveling their places to outside of the environment. They live for various reasons such as recreation, religion, culture, and for business, personal reasons (UNWTO, 2021). From the geographical perspective, tourism grows through the connection between attractions, transport networks, accommodation, settlements, visitor-generating regions, and supporting infrastructure (Smith, 1993; Scott & Lemieux, 2010; Hu et al., 2021; Parmeshwari et al., 2021). A GIS-based tourism database is very useful for comparing tourism development between regions. It can reveal districts with high concentrations of attractions and areas where tourism resources are scattered, poorly connected, and insufficiently promoted. These spatial differences are often difficult to identify through conventional statistical tables alone. GIS therefore provides a stronger basis for understanding regional tourism inequalities and for planning more balanced tourism development. Previous studies demonstrate the usefulness of geospatial methods in tourism planning.

Website: https://bnir.us

GIS and multicriteria approaches have been applied to identify suitable ecotourism areas by integrating terrain, wildlife, roads, settlements, cultural resources, and tourism facilities (Bunruamkaew & Murayama, 2011; Çetinkaya et al., 2018). In India, remote sensing and GIS have been used to relate tourism potential to environmental, administrative, and infrastructural conditions (Acharya et al., 2022). Other studies have employed tourism-resource mapping, gap analysis, network analysis, and spatial-association methods to identify resource-rich areas, underdeveloped destinations, and opportunities for regional tourism cooperation (Van der Merwe & Van Niekerk, 2013; Ruda, 2016; Kang et al., 2018; Liu et al., 2017). These studies show that geospatial analysis, can be support tourism planning by revealing regional concentrations, imbalances, and relationships among neighboring destinations. Administrative-scale analysis is very important because tourism policies, infrastructure investments, development programs and others are commonly implemented through districts and regional administrative units. District-level studies have identified geographical disparities and the influence of administrative centers on tourism-resource distribution (Zhang et al., 2023; Ding et al., 2024; Liang et al., 2024).Such studies reveal that the basic statewide count of tourist destinations might cover significant internal variation. While lesser divisions could have a higher average number of destinations per district, divisions with more districts might show more total. Divisional totals so ought to be seen along with regional rankings, variation, district-level averages, and percentage shares. Relatively little study has systematically gathered geocoded tourist sites and contrasted their numerical distribution across all state districts and administrative levels. To find places with somewhat high concentrations of tourist attractions, divisions with less representation, regional tourism networks, we must conduct district-wise and division-wise analysis. The study objectives are 1. map the locations of official tourist destinations throughout Karnataka. 2. Compare division level totals and percentage shares with those of the district. 3. Describe with descriptive statistics variance and regional differences, 4. Find places with less concentration and more tourism resources. The results are meant to help Karnataka's inter-district tourism-circuit development, infrastructure prioritizing, destination marketing, and more balanced regional travel planning.

Study Area:

In India, Karnataka covers 191,791 square kilometers. It spans longitudes of 74° E to 78°30' E and latitudes of 11°30' N to 18°30' N. Abstract

Patents Act drafted in 1970 for a world of mechanical assemblies and chemical formulations and then has to stretch them, sometimes uncomfortably, to fit technologies nobody anticipated. Artificial intelligence is the latest and perhaps the most demanding of these stretches. It is central to the country's Viksit Bharat @2047 ambitions, driving growth in pharmaceuticals, semiconductor design, fintech, and advanced manufacturing, yet it sits awkwardly within a patent regime built on the presumption that an inventor is a natural person who can be named, questioned, and held accountable. This paper works through three points of friction between AI and Indian patent law, testing each against how comparable jurisdictions the United States, the United Kingdom, and the European Patent Office have responded. The first is inventorship itself: whether a system such as DABUS can ever satisfy Sections 2(1)(y) and 6 of the Patents Act, 1970, and what happens to applications where a human contributor is named largely as a matter of convenience rather than genuine authorship. The second is the Section 3(k) exclusion for computer programmes per se and algorithms, read alongside the Delhi High Court's technical-effect reasoning in Ferid Allani and its later application to AI-adjacent claims. The third concerns disclosure: what Section 10(4) can realistically demand of a model whose internal decision pathway is, by design, not fully interpretable even to the people who trained it. Rather than treat these as abstract doctrinal puzzles, the paper closes with a set of concrete, implementable proposals clarified guidance on human-contribution thresholds, an updated CRI examination manual with AI-specific illustrations, a Budapest-Treaty-style depository for training artefacts, and time-limited sui generis right for genuinely autonomous outputs. The underlying argument is a modest one: India does not need to choose between protecting human ingenuity and encouraging AI-driven research. It needs sharper definitions, and it needs them before the volume of AI-related filings makes ad hoc case-by-case resolution unworkable.

Keywords: *Artificial Intelligence, Indian Patents Act 1970, Section 3(k), Inventorship, DABUS, PHOSITA, Computer Related Inventions (CRI), Viksit Bharat @2047, Digital Economy.*

Introduction

The idea of Viksit Bharat @2047 India completing a century of independence as a developed economy leans heavily on the assumption that the country can move up the value chain in technology-intensive sectors rather than remain a low-cost production base. The National Strategy for Artificial Intelligence, released by NITI Aayog under the banner #AIforAll, treats AI as one of the principal levers for that shift, with applications already visible in drug discovery, precision agriculture, semiconductor layout optimisation, and algorithmic finance.

None of this growth happens without a functioning patent system behind it. Patents exist to solve a fairly specific bargain: an inventor discloses how something works in exchange for a time-bound monopoly, and society benefits from both the invention itself and the knowledge that becomes public in the process.That bargain assumes an inventor who can be identified, who can meaningfully describe the invention, and whose contribution can be tested against the skill of others working in the same field. Generative and autonomous AI systems complicate every part of that assumption. It helps to keep two categories distinct, even though the line between them is not always tidy in practice. AI-assisted invention is the more familiar case: a human researcher uses machine learning as a tool to screen candidate molecules, say, or to optimise a circuit layout but retains the conceptual control over the inventive step. AI-generated invention is the harder case: the system itself identifies the problem, explores the solution space, and arrives at an output with minimal or no human direction at the point of invention. Existing law was not written with the second category in mind, and this paper is largely concerned with the gap that leaves behind. The discussion proceeds in five stages. Section 2 sets out the method. Section 3 examines inventorship under the Patents Act, 1970, against the backdrop of the DABUS litigation. Section 4 turns to the Section 3(k) exclusion and the technical-effect line of cases. Section 5 addresses the disclosure problem created by opaque, non-deterministic models. Section 6 asks what recalibrating the PHOSITA standard might actually require. The paper then offers a comparative snapshot across four jurisdictions before closing with policy recommendations aimed specifically at the Viksit Bharat @2047 timeline.

Research Objectives and Methodology

This is a doctrinal and comparative study rather than an empirical one. It draws on the text of the Patents Act, 1970 and the Patent Rules, 2003; the Guidelines for Examination of Computer Related Inventions issued by the Office of the Controller General of Patents, Designs and Trade Marks; decisions of the Delhi High Court on Section 3(k); and the DABUS decisions from the UK Supreme Court, the US Court of Appeals for the Federal Circuit, and the European Patent Office's Boards of Appeal. Policy documents from NITI Aayog and WIPO's Technology Trends report on artificial intelligence supply the broader innovation-policy context. Three questions organise the analysis: first, whether the Patents Act, 1970, as currently worded, can accommodate an AI system as inventor, and if not, what happens to the human contributors around it; second, whether Section 3(k) as interpreted through the technical-effect doctrine gives AI applicants a workable path to patentability, or whether it needs to be read or amended more explicitly; and third, whether Section 10(4)'s disclosure requirement can be satisfied by a system whose reasoning is not fully transparent even in principle.

Inventorship under the Patents Act, 1970

1. The Statutory Architecture

The Act does not define "inventor" directly. It works instead through Section 2(1)(y), which defines "true and first inventor" negatively by excluding the first importer of an invention into India and anyone to whom it was merely communicated from abroad and through Section 6, which allows an application to be filed by a person claiming to be the true and first inventor, or by that person's assignee or legal representative. Section 2(1)(s) extends the meaning of "person" to include the government, which is sometimes cited as evidence that the definition is elastic, but a government is still an entity capable of holding legal personality and being party to obligations; an AI model is not, at least not under Indian law as it stands. Nothing in the Act expressly bars a non-human inventor, which is precisely why the question has needed litigation elsewhere rather than resolving itself by plain reading. The silence cuts against AI applicants in practice, though, because ownership, assignment, and moral-rights provisions throughout the Act are drafted on the assumption that an inventor is a legal person capable of assigning rights something a model cannot do.

2. The DABUS Litigation, Read Comparatively

Stephen Thaler's Artificial Inventor Project tested this question in multiple jurisdictions at once by naming his system, DABUS, as sole inventor on a set of parallel applications. The results diverged sharply enough to be genuinely instructive. The UK Supreme Court, in Thaler v. Comptroller-General of Patents, Designs and Trade Marks, held unanimously that an inventor under the Patents Act 1977 must be a natural person, and that this was a matter of statutory construction rather than policy preference. The US Court of Appeals for the Federal Circuit reached the same conclusion in Thaler v. Vidal, reading the Patent Act's repeated use of "individual" as unambiguous on this point. The European Patent Office's Boards of Appeal, in J 0008/20 and J 0009/20, rejected the applications on the footing that Article 81 and Rule 19(1) EPC require an inventor to be an individual human being capable of exercising legal rights. South

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Africa stands as the outlier, granting the patent with DABUS named as inventor though this owes more to the formal, largely non-substantive nature of its examination process than to any considered doctrinal position on AI personhood. What is striking is not that these jurisdictions reached similar conclusions their statutory language pointed that way but that none of them found the underlying policy question easy. Judges in both the UK and US decisions were candid that the outcome followed from the words Parliament and Congress had chosen, not from any confidence that excluding AI inventors was obviously correct as a matter of innovation policy. That distinction matters for India, because it means the Indian courts, if and when the question reaches them, will face the same choice: read the existing text narrowly and defer reform to the legislature, or stretch the definition and invite exactly the kind of appellate uncertainty the UK and US decisions were trying to close off.

3 What This Means for Indian Applicants Today

For now, an applicant whose invention was substantially generated by an AI system has little choice but to name a human being as inventor typically whoever configured the system, selected the training data, or evaluated the output. This is not merely an administrative workaround; it creates real exposure. If the named individual's contribution turns out, on closer examination, to fall short of genuine inventive input, the patent becomes vulnerable to a challenge for misjoinder or non-joinder of the true inventor, a ground for revocation under Section 64. Applicants are, in effect, being asked to describe a hybrid human-AI process in terms the statute was never built to hold, and the resulting applications will only get harder to draft honestly as AI systems take on a larger share of the inventive work.

Section 3(k): The Computer Programme Per Se Problem

1. Statutory Text and Legislative Intent

Section 3(k) excludes from patentability "a mathematical or business method or a computer programme per se or algorithms." The exclusion was not written with machine learning in mind; it responds to an older concern that software, being close to abstract logic, should not receive the same exclusivity as a physical invention unless it does something more than run a set of instructions. Since a modern AI system is, at bottom, a set of trained parameters executing mathematical operations, the exclusion catches it almost by default which is exactly the problem, because it catches AI-based inventions whether or not they produce anything genuinely new in a technical sense.

2 The Technical Effect Line of Cases

The Delhi High Court's 2019 decision in Ferid Allani v. Union of India reframed how this exclusion should be read. The Court held that an invention should not be refused merely because it is implemented through software if it demonstrates a technical effect or technical contribution beyond the ordinary operation of a computer. The Guidelines for Examination of Computer Related Inventions have since been read in light of that reasoning, and the Court returned to similar ground in 2023 in Microsoft Technology Licensing, LLC v. Assistant Controller of Patents, confirming that software producing a measurable improvement in hardware performance, processing efficiency, or the resolution of a genuine technical problem sits outside the per se exclusion. Applied to AI, this means the exclusion is not, strictly speaking, a ban on machine-learning patents it is a filter that rewards applicants who can point to something concrete: a neural network architecture that measurably reduces false negatives in tumour detection, for instance, or a reinforcement-learning controller that cuts energy consumption in a manufacturing process by a demonstrable margin. Claims that describe only the algorithm in the abstract, without tying it to such an effect, remain vulnerable regardless of how sophisticated the underlying mathematics is.

3 Where the Guidance Still Falls Short

The trouble is that the CRI Guidelines were last substantially revised before generative AI and large-scale foundation models became commercially significant, and they offer patent examiners very little to work with when the claimed invention is, say, a fine-tuned language model or a diffusion-based image generator. Examiners are left applying a general technical-effect test to architectures the Guidelines never anticipated, and the result is inconsistency applicants describing functionally similar inventions receive different outcomes depending on how the examiner happens to read the claim. This is less a defect in the statute than a gap in the interpretive guidance sitting underneath it, and it is one of the more tractable problems this paper returns to in Section 8.

The Black Box Problem and Sufficiency of Disclosure

Section 10(4) requires a complete specification to describe the invention fully and particularly, including the best method of performing it known to the applicant. For a mechanical device or a chemical compound, this is a reasonably tractable exercise draw the assembly, state the reaction conditions. For a deep neural network, it is considerably harder, for three distinct

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

reasons that tend to get collapsed into one another in casual discussion but are worth separating. The first is architectural opacity: even the engineers who train a large model typically cannot trace, feature by feature, why it produced a particular output, because the relevant "logic" is distributed across millions or billions of weighted parameters rather than encoded in any single, inspectable rule. The second is reproducibility: models retrained on updated or reshuffled data, or with different random initialisation, can produce materially different outputs even from identical architectures, which sits uneasily with a disclosure regime built around the idea that a skilled reader can reproduce the invention from the specification. The third is a genuinely open drafting question does describe the training architecture, the dataset characteristics, and the hyperparameters satisfy Section 10(4), or does the disclosure need to go further and include the actual trained weights, deposited somewhere a third party could access and verify them? India has no equivalent, for computational artefacts, of the Budapest Treaty mechanism that allows biological deposits to satisfy disclosure requirements for microorganism-based inventions. That gap becomes more consequential every year that AI-related filings increase, and it is the subject of one of the recommendations in Section 8.

Recalibrating the PHOSITA Standard

Inventive step under Section 2(1) (ja) is measured against a Person Having Ordinary Skill in the Art a notional figure who is competent but not exceptionally inventive, and against whom obviousness is judged. The trouble AI creates here is subtler than the inventorship or Section 3(k) questions, because it does not require a textual amendment so much as a shift in how examiners and courts apply an existing standard. As AI-assisted tools become a routine part of research workflows predictive modelling in drug discovery, generative design in materials science, automated layout optimisation in chip design the baseline competence of an ordinarily skilled worker in those fields rises with them. An outcome that would have counted as a genuine inventive leap a decade ago may now be something a competent researcher could reach simply by running a standard AI tool over the problem. If the PHOSITA standard does not absorb that shift, patent office's risk granting protection for what is, in substance, routine automated optimisation rather than genuine inventive contribution which would flood the register with weak patents and make freedom-to-operate analysis considerably harder for everyone downstream.

Comparative Snapshot: Global AI Patent Frameworks

The table below summarises how the four jurisdictions discussed above currently treat inventorship and AI/software patentability. It is meant as an orientation point rather than an exhaustive restatement each row rests on the fuller discussion in Sections 3 and 4 above.

Jurisdiction	Inventorship Requirement	Stance on AI / Software Inventions	Key Authority
India (IPO)	Natural person required; no recognised AI personhood	Excluded under Section 3(k) unless a technical effect or technical contribution is shown	Ferid Allani (2019); CRI Guidelines
United States (USPTO)	Natural person only (Thaler v. Vidal)	Eligible under 35 U.S.C. § 101 where the Alice/Mayo framework is satisfied	USPTO AI Inventorship Guidance (2024)
European Union (EPO)	Natural person required (Rule 19 EPC)	Technical character required; mathematical methods eligible when applied to a technical field	EPO Guidelines G-II, 3.3.1
United Kingdom (UK IPO)	Natural person required (Thaler v. Comptroller)	Technical contribution test under the Aerotel/Macrossan framework	Emotional Perception AI Ltd v. Comptroller [2023]

The pattern across all four jurisdictions is consistent on inventorship natural personhood is a hard requirement everywhere it has been tested but noticeably less consistent on how generously software and AI-based claims are treated once that threshold is cleared. India's technical-effect test tracks the EPO and UK approaches reasonably closely in principle; the gap is less in the underlying

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

doctrine than in the depth of AI-specific examiner guidance available to apply it.

A Policy Roadmap for Viksit Bharat @2047

None of the difficulties described above require dismantling the Patents Act, 1970. What they require is targeted clarification, delivered on a timeline that keeps pace with the volume of AI-related filings the Indian Patent Office is already starting to see. Four proposals follow.

1. Clarify the Threshold for AI-Assisted Inventorship

The Patent Office could adopt guidance broadly similar to the USPTO's 2024 framework, which recognises a human inventor where that person made a significant contribution to the conception of the invention through problem formulation, prompt or query design, architectural choices, or substantive evaluation and refinement of AI-generated candidates while excluding contributions that amount to nothing more than pressing a button and accepting whatever the system returns. Publishing worked examples alongside the guidance would do more for consistency than the abstract standard alone.

2. Update the CRI Guidelines with AI-Specific Illustrations

The Examination Manual for Computer Related Inventions needs concrete, current illustrations of what counts as a technical effect for architectures the current version does not address edge-deployed inference models, automated drug-synthesis pipelines, and fine-tuned generative models among them. Worked examples reduce the room for inconsistent examiner interpretation far more effectively than restating the technical-effect test in the abstract.

3. Establish a Depository for Training Data and Model Artefacts

India could build an accession mechanism modelled on the Budapest Treaty's treatment of biological deposits, allowing applicants to deposit representative datasets or deterministic model snapshots with a recognised repository to satisfy Section 10(4) where the specification alone cannot fully capture how the model behaves. This would give third parties a genuine basis for verification without forcing applicants to disclose full commercial training pipelines in the published specification.

4 Consider a Sui Generis Right for Autonomous Outputs

For the narrower category of outputs genuinely lacking an identifiable human inventor, shorter-term sui generis right in the range of five to seven years, well short of the twenty-year patent term would reward the capital and computational investment behind such systems without extending full patent-strength exclusivity to outputs where no human exercised inventive judgment. This keeps foundational AI-generated advances more accessible to follow-on research than a standard patent term would, while still giving investors a return horizon worth the underlying compute cost.

Conclusion

The Viksit Bharat @2047 vision assumes India can compete at the frontier of AI-driven innovation, and a patent system that cannot cleanly process AI-related applications works against that goal in ways that are easy to underestimate until the backlog and the litigation start to accumulate. The three problems examined here inventorship, the Section 3(k) exclusion, and disclosure under Section 10(4) are not, on inspection, unanswerable. Comparative practice in the US, the UK, and before the EPO shows that natural-personhood requirements for inventorship can coexist with a workable, technical-effect-based path to patentability for AI and software inventions generally. What India needs is not a wholesale rewrite of the Patents Act, 1970, but sharper administrative guidance, a disclosure mechanism suited to non-deterministic systems, and an honest conversation about whether some AI-generated outputs deserve a different, shorter form of protection altogether. Getting this right now, while the volume of filings is still manageable, is considerably cheaper than trying to fix it after the fact.

Acknowledgement

The authors express their sincere gratitude to all those who contributed, directly or indirectly, to the completion of this research paper titled "Artificial Intelligence and Patent Jurisprudence in India: Navigating Inventorship, Section 3(k) Dilemmas, and the Roadmap for Viksit Bharat @2047." The authors are deeply grateful to their respective institutions for providing an encouraging academic environment and the necessary support for undertaking this doctrinal and comparative study.

Abstract

Generative Artificial Intelligence (Generative AI) has significantly influenced students' approach to formal writing. The present research, titled "Impact of Generative AI on the Formal Writing Practices of Undergraduate Students," tries to examine the extent, frequency, purposes, and perceived effects of Generative AI used by undergraduate students in formal writing. A descriptive survey research design along with a quantitative approach was applied. A structured online questionnaire was prepared using Google Forms to collect primary data from undergraduate students representing programmes such as B.A., BMS, BAF, B.Com., B.Sc. Computer Science, B.Sc. IT, Psychology, History, and B.A.M.M.C. A total of 108 responses were obtained. Non-probability convenience sampling was used, and responses were analysed on the basis of frequency and percentage analysis, along with interpretation of Likert-scale responses. The findings show that a considerable number of undergraduate students use Generative AI in formal writing practices, which is clear as 94 out of 108 respondents (86.9%) selecting previous use of Generative AI for formal writing. ChatGPT proved to be the most popular Generative AI tool used by the students, followed by Google Gemini and Claude. The study reveals students' use of AI for generating ideas, drafting content, improving grammar and language, summarising information, and editing written work. This study is aimed at finding out the degree of AI help in formal writing, the level of students' improvement in their writing skills, confidence in writing without AI help, acceptance of AI-written content without major editing, and their readiness to keep using the tools. This study reveals the significance of Generative AI in the field of formal writing of undergraduates and the advantages, as well as possible drawbacks, connected to their dependence on the technology. These results can be helpful in studying the influence of Generative AI on the writing process of students and will help the educational institutions and teachers to encourage proper and ethical use of Generative AI by students.

Keywords: *Generative AI, formal writing, undergraduates, ChatGPT*

Introduction

The written word is a fundamental mode of communication in academia. It is expected that undergraduates will learn to write formally, to convey their thoughts clearly, logically, and effectively via assignments, reports, essays, exams, projects, and other scholarly tasks. Formal writing entails more than just grammatically correct sentences and appropriate vocabulary. It also includes critical thought, creativity, coherent organization, and independent argumentation. However, with the rapid advancement of digital technologies, new avenues have emerged for the writing process. The emergence of Generative Artificial Intelligence (Generative AI) is one of the most notable technological innovations in recent years. Programs like ChatGPT, Google Gemini, Claude and others that are based on AI are capable of generating, rewriting, summarizing, paraphrasing, editing and enhancing any kind of written material in no time.

The use of these programs is becoming more widespread among students who use them for different formal writing tasks. The Generative AI may help students in creating suggestions on how to organize their ideas, correct their grammatical mistakes, enhance their vocabulary, create outlines and write drafts. On the other hand, the growing prevalence of Generative AI brings up issues concerning its effect on the actual writing process of students. As a writing tool, AI can be helpful, but an over-reliance on AI-written texts will lower students' involvement in the process of generating and organizing their ideas. Students might turn to AI for the actions that were expected from students individually in the past – brainstorming, paraphrasing, making drafts, editing, and forming an argument. Consequently, Generative AI's effect on formal writing is neither wholly positive nor wholly negative. The effect may be contingent upon the manner and reasons for which students make use of these tools. AI usage could improve writing proficiency and be helpful to a great extent; however, over-reliance on these technologies might change the conventional writing methods used by students and decrease their participation in the writing process. This is especially significant since undergraduates are at a stage when they develop skills required for their further studies and profession.

Concept of Generative Writing:

Generative AI, also known as Gen AI, refers to AI technology that has the ability to create fresh content such as text, graphics, videos, music, audio, or even computer code based on the user's input or instructions.

Generative AI technology utilizes advanced machine learning algorithms known as deep learning models algorithms that mimic the way the human brain learns and makes decisions. This is achieved through the process of finding and encoding the relationships within large sets of data and responding to the user's natural language input or questions.

Concept of Formal Writing:

Formal writing is a type of writing employed in professional, academic, or business settings. Formal writing has specific guidelines as regards grammar, tone, and organization. In contrast to informal writing, formal writing does not employ contractions, slang, and personal phrases. Formal writing is all about being explicit, respectful, and impartial. It is a form of writing suited for occasions where your writing speaks on your behalf. In this regard, the current study titled "Impact of Generative AI on Formal Writing Practices among Undergraduate Students" endeavors to explore the impact of usage of Generative AI on the formal writing practices of the undergraduate students. The current study would attempt to analyze the patterns of use of Generative AI by the students, the nature of writing tasks in which they utilize Generative AI, and the usefulness of the latter. Moreover, the current study would seek to find out whether the use of AI has impacted the drafting, editing, vocabulary, idea organization, originality and independent writing by the students.

Literature Review

Another important theme that comes out of the literature is that the application of Generative AI as a writing assistant goes beyond its role as a text generator. Students can use the technology at various stages of writing, such as brainstorming, outlining, drafting, paraphrasing, editing, and proofreading. Imran and Almusharraf (2023) observed in their systematic review that ChatGPT can be used as an assistant in the process of academic writing by generating ideas for students, organizing information, and improving language proficiency. But they stressed that the usefulness of ChatGPT in education will depend on the appropriate usage. Otherwise, if the students plagiarize the text generated by AI, it will harm their writing skills. In a similar vein, studies involving university students' usage of ChatGPT show that the tool is used by the students for multiple purposes related to writing, such as idea generation, language correction, translation, and even completion of the assignment. This is what Črček and Patekar (2023) did when they explored the university students' usage of ChatGPT for written assignments and also their perception of ethical concerns in the process of AI-aided writing. Therefore, the literature clearly shows a critical difference between AI-assisted writing and AI-generated writing. In the former, the students are responsible for the contents while using AI as a facilitator, while in the latter, the AI does most of the work involved. One notable potential advantage of Generative AI could be in providing instant feedback on language use. AI-based programs will help detect mistakes in grammar, provide alternative words, make sentences better structured and improve the tone of the text. In their recent comprehensive review of 136 papers published during 2023-early 2025, Sanz-Tejeda et al. (2025) have shown that in many studies there was a reported improvement in the areas of student writing, such as coherence, discourse organization, lexical variety and argumentation when Generative AI was properly used in academic writing. Additional research related to undergraduate medical students is available. A study involving 130

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

third-year medical students shows that the students using ChatGPT complete their tasks faster since 69.7% of them complete the task in two or three days as opposed to only 48.4% of the control group. The research results prove that Generative AI can help the students deal with certain surface errors in writing. At the same time, grammatical correction does not always imply that the students become better at grammar. The difference is vital for the research on writing competencies. There is a field of research that is focusing on whether the growing use of Generative AI technology is affecting the actual style of undergraduate writing. One study was conducted that looked at 4,820 authentic psychology empirical reports between 2016 to 2025 that was published in the journal Computers and Education: Artificial Intelligence. Changes in undergraduate writing were noted after the appearance of ChatGPT. In this regard, language that is used in GPT-written documents increased in 2024, and the writing done by the students became more formal and positive. However, this was not reflected in grades or feedback. Such an observation is highly relevant to the study being designed because it implies that changes in writing style cannot always be taken as an enhancement in writing skills. The use of AI can make undergraduates write in a more formal manner without any increase in their writing skills. Therefore, a clear distinction must be made between: enhancement in the quality of the written output and development in the writing skills of the undergraduate.

Research Gap

The extant literature shows much concern about Generative AI, ChatGPT and academic writing. Nonetheless, there are several areas for future exploration.

1. The product versus skill gap

· Although most previous studies analyze the effectiveness of AI-aided papers or efficiency, much less focus has been placed on whether regular use of AI tools fosters or diminishes the skills of independent writing.

2. Dependence versus assistance

· It has been recognized in extant literature that dependence on AI represents a great risk, although it is necessary to conduct research on the relationship between regular and particular use of AI tools and writing skills.

3. Dimensions of formal writing

· Extant studies mention general characteristics of academic writing. It would be helpful to examine separate dimensions of formal writing, such as grammar, vocabulary, sentence construction, coherence, organization, argumentation, formal tone, critical thinking and originality within one framework.

Objectives of the study

1. To examine the extent of Generative AI use in formal writing among undergraduate students.
2. To assess the perceived impact of Generative AI on students' formal writing skills.
3. To examine the effect of Generative AI use on students' confidence in their writing abilities and assess students' tendency to use AI-generated content without substantial editing.
4. To examine students' willingness to continue using Generative AI for formal writing.

Methodology

This current study employed the use of descriptive survey research design in analyzing the effect of Generative Artificial Intelligence (Generative AI) on the formal writing of undergraduate students. This involved exploring the students' experience, usage frequency of Generative AI, reason for using Generative AI, amount of help from AI in writing, improvement in writing skills, and dependence/confidence with respect to AI writing. Quantitative methodology was employed since responses from the participants were obtained by means of questionnaire and analyzed using frequencies and percentages. Survey technique was selected since it allows the researcher to recognize patterns in formal writing practices of students and the effect of Generative AI on the same.

Population and Sample

The sample of the study included undergraduate students who mainly came from Thakur Ramnarayan College of Arts and Commerce and various undergraduate courses offered there. There were 108 responses for the questionnaire. The respondents came from different undergraduate courses such as B.A., BMS, BAF, B.Com., B.Sc. Computer Science, B.Sc. IT, B.A. Psychology, B.A. History, B.A.M.M.C., and other undergraduate courses.

Mostly the respondents were young undergraduate students who were between 16 years old and 22 years old.

Data Collection

Data for this research have been gathered mostly from primary sources by means of a structured online questionnaire that was developed using Google Forms. Questionnaires were distributed to undergraduate students, and a total number of 108 responses have been obtained.Questions in the questionnaire were about demographics, education, use of Generative AI, frequency of use, reasons for using, extent of AI involvement, impact on the

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

writing abilities, plans to use AI in the future, self-assurance in writing and accepting AI content.

Non-probability sample was used in the study, and the convenience sampling method was applied. It entailed distributing questionnaires to accessible and willing undergraduate students. This approach was suitable for an exploratory research design and made it possible to collect data from students pursuing various undergraduate programmes. Because the questionnaire was sent via e-mail, participation was voluntary. Thus, the sample consists of the students who had access to the questionnaire and agreed to take part. The data was gathered with the help of a structured questionnaire that was created specially for the study called "Impact of Generative AI on Formal Writing Practices among Undergraduate Students."

Some of the questions covered the following areas:

- demographic and academic details;
- prior use of Generative AI in formal writing;
- Generative AI software utilized by the students;
- frequency of AI use;
- purposes of Generative AI use;
- extent of AI support in formal writing;
- perception of the influence of Generative AI;
- improved writing ability after Generative AI use;
- intention to use Generative AI in the future;
- confidence in formal writing without Generative AI; and
- acceptability of the use of AI-generated content without significant modification.

The questionnaire contained multiple-choice as well as Likert-scale questions. For instance, Questions 14 and 15 involved the Likert scale that ran from Strongly Disagree to Strongly Agree.

Variables Considered

Usage of Generative AI is the key independent variable of this research, which will be assessed by such parameters as frequency of use, tools employed, purposes of using Generative AI, and percentage of writings generated with the help of AI.

Writing practices of students become the key dependent aspect of the research. The variables will include perception of improvement in writing skills, general effect on writing, ability to write without the help of AI, and tolerance for unaltered AI-generated writing.

Data Analysis

The gathered data were analyzed through descriptive statistics, mainly frequency counts and percentage. For the multiple-response questions like the one regarding the AI tools and purpose of AI use, the answers were analyzed according to the number of people who chose the particular option. The data from the Likert-scale were analyzed in order to determine the overall degree of agreement or disagreement towards the statements about writing confidence and dependency on AI. A detailed analysis of the responses (Question No. 6 to 15) is given below.

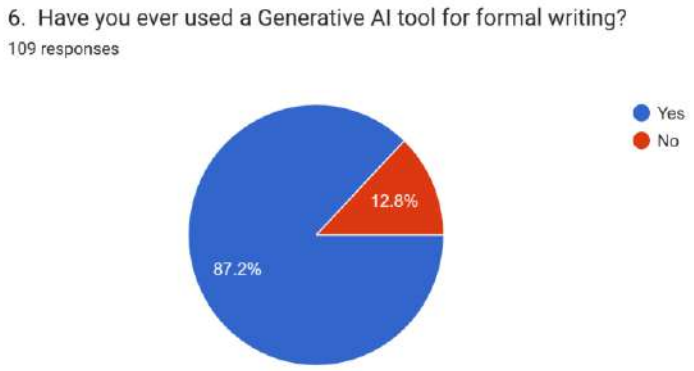

Figure 1: Responses for whether respondents had previously used a Generative AI tool for formal writing

Interpretation

Figure 1 shows that 87% of respondents stated that they have used Generative AI tool for formal writing whereas 13% of respondents mentioned that they never used Generative AI tools for formal writing.

Discussion

The findings reveal a very high level of usage of Generative AI tools for formal writing among undergraduate students. Nearly nine out of every ten students have been using such tools. This indicates that Generative AI has become a significant part of students' formal writing practices.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

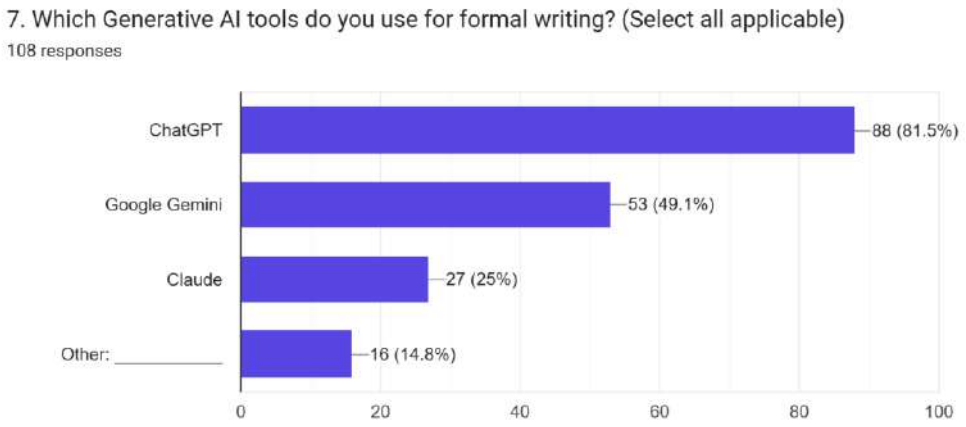

Figure 2: Responses to the types of Generative Tool used for formal writing

Interpretation

The responses indicate that ChatGPT is the most widely used Generative AI tool for formal writing, with 87 respondents (81.3%) reporting its use which is followed by Google Gemini, used by 52 respondents (48.6%). Claude is selected by 27 respondents (25.2%), while 16 respondents (15%) reporting the use of other Generative AI tools.

Since the question allowed respondents to choose more than one option, the percentages add up to more than 100%. This reveals that some students use multiple Generative AI tools for formal writing.

Discussion

The findings clearly shows that ChatGPT is the most popular Generative AI tool amongst the undergraduate students for practising formal writing. The data indicates that students do not depend on a single AI platform, as a considerable proportion utilise multiple tools.

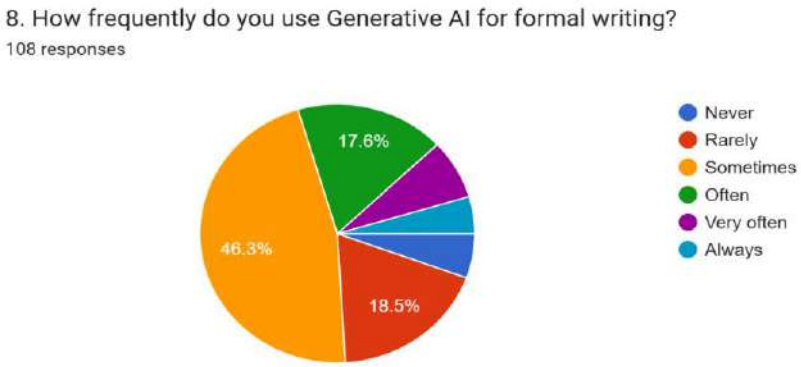

Figure 3: Frequency of using Generative AI

Interpretation

- 46.3% (50 students) use Generative AI sometimes, making this the highest category.
- 18.5% (20 students) rarely use it .
- 17.6% (19 students) often use it
- 7.4% (8 students) very often use it .
- 5.6% (6 students) stated never using it.
- 4.6% (5 students) always use Generative AI.

Discussion

The findings indicate that Generative AI has become a regular, though not necessarily constant, choice for undergraduate students for practising formal writing skills. Almost half of the respondents (46.3%) use AI sometimes, suggesting that students may use these tools depending on the nature of a particular writing task.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

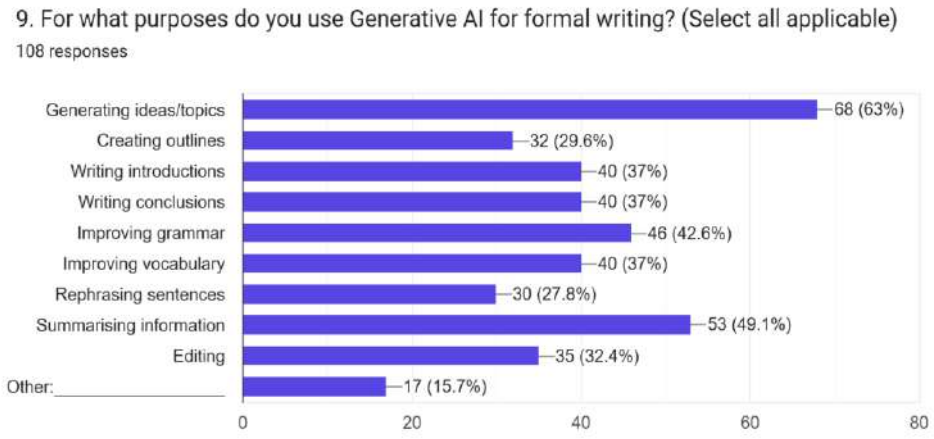

Figure 4: Purposes for using Generative AI

Interpretation

The findings reveal that undergraduate students use Generative AI for a wide range of formal writing skills, with idea generation and summarisation being the most dominant purposes. Generating ideas/topics is the most common purpose, reported by 68 respondents (63%).

Discussion

The results indicate that students primarily use Generative AI during different stages of the writing process. The highest percentage (63%) for generating ideas/topics indicates that students particularly value AI for brainstorming and overcoming difficulties in beginning a writing activity.

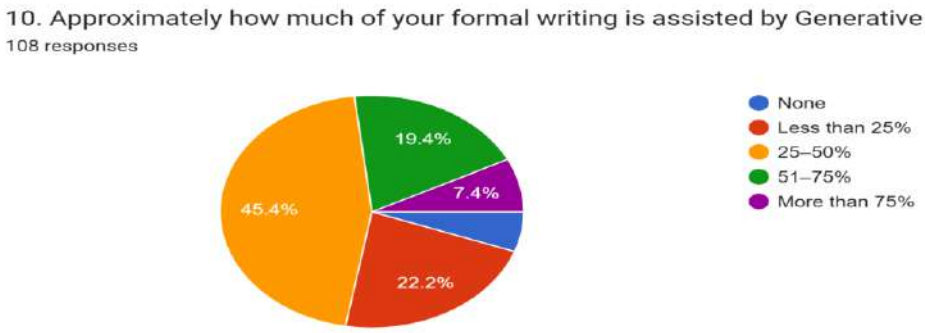

Figure 5: Extent of assistance by Generative AI

Interpretation

45.4% of respondents stated that 25–50% of their formal writing is Generative AI assisted and this is the largest group.

22.2% reported that less than 25% of their writing is assisted by Generative AI.

19.4% reported that 51–75% of their formal writing is assisted by Generative AI.

7.4% indicated that more than 75% of their formal writing is Generative AI assisted.

Only 5.6% reported receiving no Generative AI assistance in formal writing tasks.

Discussion

The findings sugges that Generative AI provides a moderate level of assistance in the formal writing tasks of most undergraduate students. The largest proportion of students (45.4%) stated that between 25% and 50% of their formal writing is Generative AI assisted.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

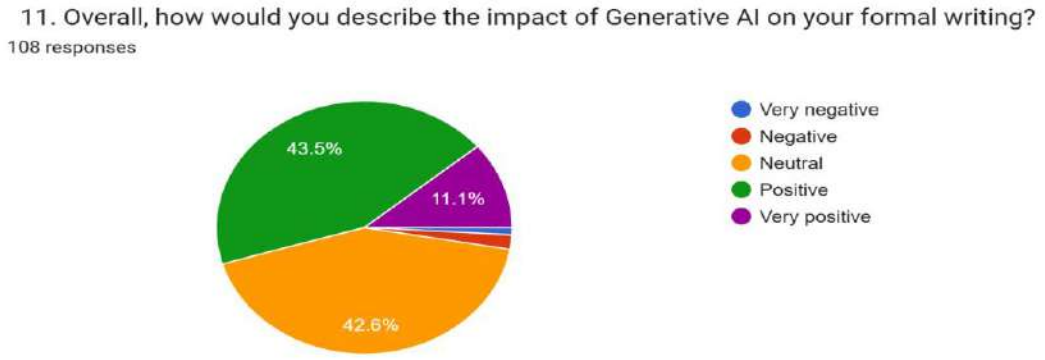

Figure 6: Impact of Generative AI

Interpretation

The above responses indicate that 43.5% students admit the influence of Generative AI on their formal writing practices whereas a considerable proportion of students have remained neutral and a very small percentage has reported that Generative AI has no impact on their writing.

Discussion

A higher proportion of positive responses suggests that students consider Generative AI useful in improving aspects such as clarity, grammar, vocabulary, organization, and overall quality of formal writing. On the other hand, negative or neutral responses may indicate concerns regarding overdependence, originality, critical thinking, or loss of individual writing skills ability.

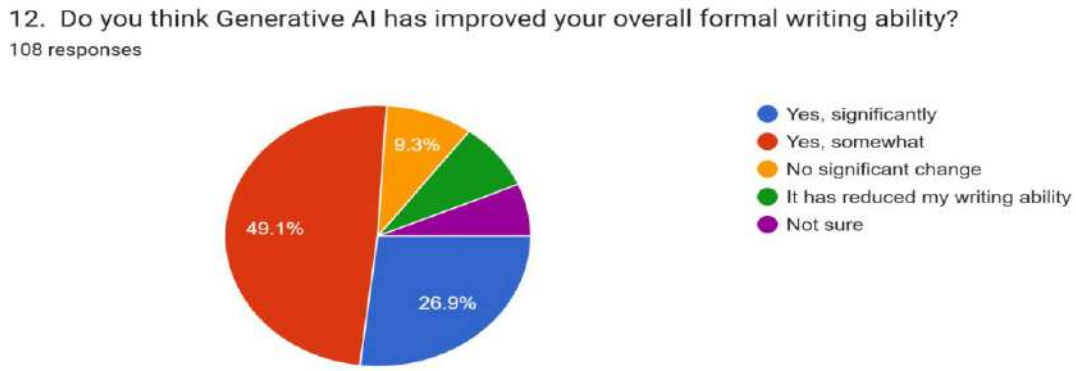

Figure 7: Generative AI has improved your overall formal writing ability

Interpretation

The responses shows that a considerable proportion(26.9 %) of students feels that Generative AI has significantly improved their formal writing ability. Highest percentage of students consider that Generative Al has somewhat improved their overall writing skill ability whereas a very small proportion of students (9.3%) thinks that Generative AI has not made any significant change in their formal writing skills.

Discussion

The majority of respondents who has chosen positive options suggest that Generative AI is perceived as a useful aid in improving formal writing ability. This may suggest that students use AI tools for improving grammar, vocabulary, sentence structure, clarity, organization, and overall presentation.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

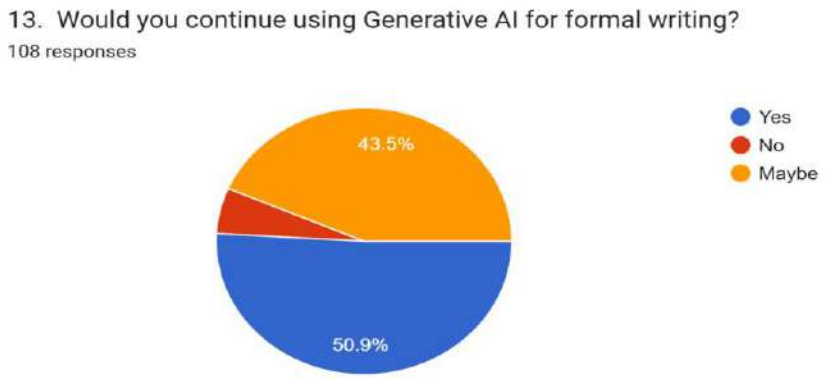

Figure 8: Continue using Generative AI for formal writing

Interpretation

The above responses show that highest percentage of students would continue to use Generative AI for practising writing skills whereas very negligible number of students have opted not to use Generative AI for formal writing tasks.

Discussion

A high proportion of students selecting "Yes" suggests that they consider Generative AI useful and convenient for supporting their formal writing activities.

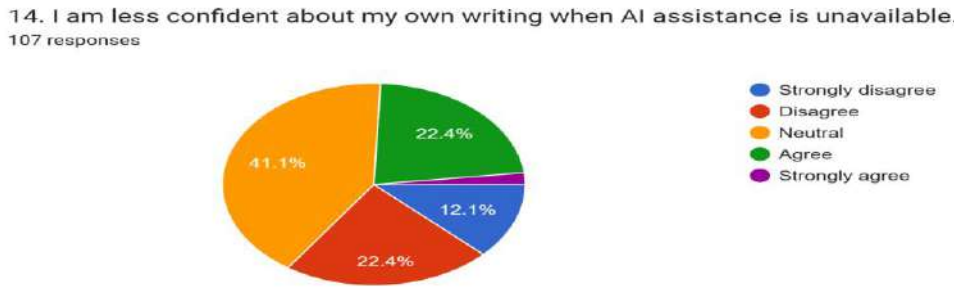

Figure 9: Confidence about writing when AI assistance is unavailable.

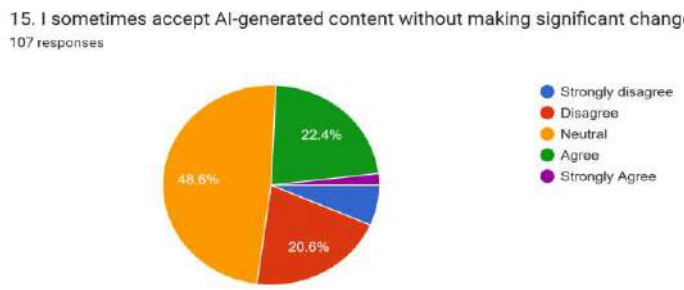
Interpretation

The above responses reveal that 22.4% students agree that they feel less confident about their own writing when AI assistance is not available whereas the same proportion of students disagree in this matter. Highest percentage of students remained neutral.

Discussion

A higher proportion of students agreeing with the statement indicates that frequent use of AI assistance may be associated with reduced confidence in writing independently. Conversely, students who disagree with the statement demonstrate greater confidence in their ability to write independently despite using AI tools. The neutral responses may indicate uncertainty about whether AI assistance has influenced their self-confidence.



© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Figure 10: Accept AI-generated content without making significant changes.

Interpretation

22.4% students believe that they accept AI generated content without making any significant changes while 20.6% 0f the respondents disagree with this view. 48.6% remained neutral whereas 6.5% strongly disagreed in this matter.

Discussion

A higher proportion of students agreeing with the statement would indicate a tendency to depend directly on AI-generated content whereas students who disagree with the statement are more likely to review, edit, and modify AI-generated content before including it into their formal writing.

Ethical Considerations

Study participation was voluntary. The questionnaire was employed for research purposes only. The respondents did not have to supply information that would not be relevant to the goals of the research. The information obtained was considered research data and was analyzed collectively rather than individually.

Scope and Limitations of the Methodology

The study is quite informative about the perceptions and practices of undergraduate students with regards to GenAI-assisted formal writing. Nonetheless, the sample size of 108 participants is relatively small and limited to the college population covered by the survey. Hence, the results cannot be automatically applied to all undergraduate students in India. In addition, the self-reporting nature of the research can affect its results since the actual usage of AI can slightly differ from the reported one. In particular, the changes in writing practices observed in the study have been perceived rather than measured by comparing the actual written texts prior to and after the usage of Generative AI. Consequently, the results of the research can reflect mostly the perception and experience of the students. Besides, a slight discrepancy in the number of responses in different questions shows that some participants did not complete the entire survey. Nevertheless, the gathered data can contribute to the understanding of the emerging connection between Generative AI and the formal writing practices of undergraduate students.

Conclusion

In summary, this research shows that Generative AI has a substantial potential in shaping the writing practices of undergraduate students with both benefits and threats related to overreliance on it. The effect of Generative AI will depend on how students will use it. If students use the technology properly and ethically, they may benefit from improving their writing skills; otherwise, improper use will negatively affect the development of writing and thinking skills. Thus, universities should concentrate on promoting AI literacy, proper use of AI, academic integrity, and independent writing skills in their students. Generative AI should be incorporated into academic writing as a tool, and students should remain thinkers and writers in the writing process.

Acknowledgement

I would like to express my sincere gratitude to all those who contributed to the successful completion of this research paper entitled "Impact of Generative AI on Formal Writing Skills of Undergraduate Students." The study examines the use of Generative AI in formal writing, its perceived impact on students' writing abilities, confidence, and future use. I am deeply thankful to the Principal and management of Thakur Ramnarayan College of Arts and Commerce, affiliated to the University of Mumbai, for providing an encouraging academic environment and the necessary support for conducting this study.

Appendix

Questionnaire on

Impact of Generative AI on Formal Writing Practices among Under Graduate students.

The study aims to understand how students use generative AI tools in formal writing, and how such use may influence their writing habits, skills, confidence, and practices. Kindly respond to all the questions asked.

1. Name of the student
2. . Name of the College
3. . Programme/Course
4. Year of Study
5. Age
6. Have you ever used a Generative AI tool for formal writing?

Mark only one oval.

Yes
No

7. Which Generative AI tools do you use for formal writing? *(Select all applicable)*

Check all that apply.

ChatGPT
Google Gemini
Claude
Other: _____

8. How frequently do you use Generative AI for formal writing?

Mark only one oval.

Never
Rarely
Sometimes
Often
Very often
Always

9. For what purposes do you use Generative AI for formal writing? *(Select all applicable)*

Check all that apply.

Generating ideas/topics
Creating outlines
Writing introductions
Writing conclusions Improving grammar
Improving vocabulary
Rephrasing sentences
Summarising information
Editing
Other:_____

10. Approximately how much of your formal writing is assisted by Generative AI?

Mark only one oval.

None
Less than 25%
25–50%
51–75%
More than 75%

11. Overall, how would you describe the impact of Generative AI on your formalwriting?

Mark only one oval.

Very negative
Negative
Neutral
Positive
Very positive

12. Do you think Generative AI has improved your overall formal writing ability?

Mark only one oval.

Yes, significantly
Yes, somewhat
No significant change
It has reduced my writing ability
Not sure

13. Would you continue using Generative AI for formal writing?

Mark only one oval.

Yes
No
Maybe

14. I am less confident about my own writing when AI assistance is unavailable.

Mark only one oval.

Strongly disagree
Disagree
Neutral
Agree
Strongly agree

15. I sometimes accept AI-generated content without making significant changes.

Mark only one oval.

Strongly disagree
Disagree
Neutral
Agree
Strongly Agree

Abstract

India has recognized Artificial Intelligence (AI) as a critical driver of economic growth and technological progress. With initiatives such as the AI portal indiaai.in and the AIRAWAT cloud infrastructure, the country is positioning itself as a global AI hub. AI is being applied across healthcare, education, infrastructure, policy-making, and governance. This paper reviews India's AI journey with emphasis on national strategies, AI startups, chatbot applications, central and state-level initiatives, and ethical concerns. It highlights India's efforts to leverage AI for socio-economic development and its potential role in building Viksit Bharat —a technologically advanced and inclusive developed nation.

Keywords: *Artificial Intelligence, Viksit Bharat, AI Strategy, AI Startups, AIRAWAT, AI Ethics, Indian Government Initiatives*

Introduction

Artificial Intelligence is the simulation of human intelligence through algorithms that enable machines to analyze, interpret, and solve problems. Subfields such as machine learning, deep learning, natural language processing, and robotics are reshaping industries globally. For India, AI offers unique opportunities to address local challenges—such as multilingual communication, agriculture, infrastructure, and healthcare—while also creating solutions with global applicability. With its large digital population and diverse datasets, India is well-positioned to emerge as a leader in AI innovation. Government policies, budget allocations, and startup support mechanisms demonstrate strong intent to create a robust AI ecosystem. However, the country must address challenges such as skill shortages, inadequate infrastructure, and cybersecurity vulnerabilities.

AI Chatbots: A Tool for Public Service Delivery

AI chatbots are being widely adopted across banking, education, and governance for real-time service delivery. Indian banks like SBI, HDFC, and ICICI use chatbots for customer assistance, while the government has launched MyGov Corona Helpdesk to provide COVID-19 updates. In education, chatbots support personalized learning and research assistance. State governments, including Maharashtra and Telangana, are deploying chatbots for public service queries, making citizen–government interaction more efficient. With initiatives like "Chatbot-as-a-Service" under National Cloud Meghraj, AI conversational agents are set to expand across sectors.

AI Startups in India: Catalysts for Innovation

India has emerged as the world's third-largest AI startup hub, with companies innovating in healthcare, financial services, agriculture, and mobility. Startups like Qure.ai (healthcare imaging), Bobble AI (multilingual keyboards),

and Nirmani (cancer detection) exemplify India's entrepreneurial drive. Supported by NASSCOM, MeitY, and international collaborations, these startups are transforming India into a technology-enabled economy. While investment levels still lag behind the US and China, India's talent pool and focus on applied AI provide a strong foundation for scaling.

National AI Strategy, Portal, and AIRAWAT Cloud

In 2018, NITI Aayog released National Strategy for AI with the vision of "AI for All," focusing on healthcare, agriculture, education, smart cities, and national security. The AI portal indiaai.in , launched in 2020, serves as a one-stop platform for research, news, case studies, datasets, and learning resources. It fosters collaboration between government, academia, and industry.

The proposed AIRAWAT cloud infrastructure provides centralized AI research and computing resources, enabling large-scale data storage and high-performance analytics. Together, these initiatives lay the foundation for India's long-term AI leadership.

AI Initiatives by Central and State Governments

The central government has created a comprehensive policy framework to promote AI adoption in governance, agriculture, transport, and finance. Initiatives include:

SENSAGRI project (Ministry of Agriculture) – drone-based crop and soil monitoring.

Rail Mitra app (Indian Railways) – predictive services for passengers.

AI-enabled robots USTAAD – enhancing railway safety.

State governments are also active:

Tamil Nadu – AI-based pest control and water monitoring systems.

Telangana – AI in healthcare, robotics in policing, and smart tourism chatbots.

Karnataka – digital agriculture and AI research centers.

These initiatives demonstrate India's multi-level approach to integrating AI into governance and development.

Upcoming Research Areas in AI

Emerging AI research in India focuses on explainable AI, reinforcement learning, blockchain integration, and resource-efficient machine learning. These technologies aim to address transparency, scalability, and ethical concerns.

Data lakes, augmented analytics, and privacy-preserving AI are expected to be central to India's AI research ecosystem. Given the rapid growth of digital data, emphasis will remain on building responsible and inclusive AI frameworks.

Ethics in AI: A Growing Concern

While AI offers transformative potential, it raises issues of bias, job displacement, privacy, and accountability. A regulatory framework is essential to ensure fairness, transparency, and public trust. India can adopt global best practices, such as the EU's AI ethics guidelines and Singapore's FEAT principles, while also creating India-specific frameworks. Companies like Microsoft, Google, and IBM are already integrating ethical principles into their AI systems, setting benchmarks for responsible innovation.

For Viksit Bharat , ethical AI will be crucial to balance technological progress with social welfare.

Conclusion

AI technologies can revolutionize governance, economic growth, and citizen services. With initiatives such as the AI portal, AIRAWAT cloud, and the National Strategy on AI, India is building a strong foundation for becoming a global leader. Central and state-level projects across sectors—healthcare, agriculture, education, transport, and finance—show India's commitment to using AI for socio-economic development. As India aspires towards Viksit Bharat , AI will play a central role in bridging gaps, enhancing productivity, and ensuring inclusive growth. Ethical frameworks, skill development, and international collaborations will be key in transforming India into a truly AI-enabled developed nation.

Abstract

Climate change has emerged as one of the most significant environmental challenges affecting Maharashtra, with changes in temperature patterns becoming increasingly important for the state's agriculture, water resources, ecosystems, human health, and economy. "Changing Temperature Trends and Climate Change in Maharashtra" examines the spatial and temporal variations in temperature across Maharashtra and evaluates their relationship with broader climate-change processes. The study focuses on changes in annual and seasonal maximum and minimum temperatures, frequency of extreme temperature events, and regional variations across different geographical regions of the state. Maharashtra experiences considerable climatic diversity, ranging from the humid Konkan coast and Western Ghats to the semi-arid Deccan Plateau and Vidarbha region. Therefore, the impacts of changing temperatures vary considerably from one region to another. The study can utilize long-term meteorological temperature records, rainfall data, climate datasets, and secondary information from government and scientific agencies. Statistical techniques such as temperature trend analysis, decadal comparison, and correlation and regression analysis can be used to identify significant changes in temperature patterns. The findings are expected to indicate an overall warming tendency, although the magnitude and pattern of change may differ spatially and seasonally. Rising temperatures may contribute to increased heat-wave conditions, water stress, agricultural vulnerability, changes in vegetation patterns, and increased risks of forest fires. The study highlights the importance of regional climate monitoring, climate-resilient agriculture, efficient water management, urban heat mitigation, ecosystem conservation, and appropriate adaptation strategies. Understanding the changing temperature trends is essential for developing effective climate-change policies and strengthening the environmental and socio-economic resilience of Maharashtra.

Keywords*-Climate Change; Temperature Trends; Global Warming; Temperature Variability; Heat Waves; Climate Variability; Agricultural Vulnerability; Water Resources, Temporal Analysis.*

Introduction

Climate change is one of the most important environmental and geographical challenges of the twenty-first century. It refers to long-term changes in temperature, rainfall, atmospheric conditions, and other climatic characteristics. Among the various indicators of climate change, **temperature is one of the most significant and measurable indicators**. Increasing average temperatures, changes in maximum and minimum temperatures, prolonged heat waves, and increasing frequency of extreme temperature events are being observed in many parts of the world. These changes have important consequences for natural ecosystems, agriculture, water resources, human health, biodiversity, and economic activities. India is highly vulnerable to climate variability because of its diverse physiography, monsoon-dependent agriculture, large population, and wide range of climatic conditions. Temperature conditions in India vary considerably from the Himalayan region to the coastal areas and from humid regions to semi-arid interiors.

In recent decades, changes in temperature patterns have become an important concern for environmental planning and sustainable development. Rising temperatures can increase evaporation and water demand, influence crop growth, intensify heat stress, and alter ecological processes. The effects become particularly important when increasing temperatures occur together with irregular rainfall, droughts, and other extreme weather events. Maharashtra provides an important geographical setting for studying changing temperature trends because of its considerable regional variations in climate, topography, land use, and economic activities. The state covers approximately 3.08 lakh km² and includes diverse geographical regions such as the Konkan coastal belt, Western Ghats, Maharashtra Plateau, Marathwada, and Vidarbha. These regions differ significantly in elevation, rainfall, vegetation, soil, agricultural systems, and degree of urbanization. Consequently, temperature trends and their impacts are not uniform throughout the state. The Konkan region, including the Mumbai Metropolitan Region, experiences a relatively humid and maritime climate because of its proximity to the Arabian Sea. In contrast, the interior plateau and Marathwada experience relatively drier climatic conditions and greater seasonal temperature variations. Vidarbha is also characterized by high summer temperatures and periodic heat-wave conditions. The Western Ghats have comparatively cooler and wetter conditions because of their elevation and orographic influence. These regional differences make Maharashtra suitable for examining the spatial and temporal dimensions of temperature change. Urbanization has also become an important factor influencing temperature patterns in Maharashtra. Rapid growth of cities such as Mumbai, Pune, Nagpur, Nashik, Thane, Chhatrapati Sambhajinagar and other urban centres has resulted in changes in land use and land cover. Expansion of built-up areas, reduction of vegetation, increased use of concrete and asphalt surfaces, industrial activities, traffic, and energy consumption can contribute to localized warming and the development of urban heat islands. Therefore, temperature changes observed in urban areas may be influenced by both broader climate change and local human-induced environmental modifications. Agriculture is another sector that is highly sensitive to temperature changes. Maharashtra is an important agricultural state, with crops such as cotton, soybean, sugarcane, pulses, cereals, fruits and vegetables cultivated across different regions. Changes in temperature can affect crop growth periods, soil moisture, evapotranspiration, water requirements, flowering, grain formation, and crop yields. Increasing temperatures combined with irregular rainfall can increase agricultural risks, particularly in drought-prone areas of Marathwada and parts of Vidarbha and the Deccan Plateau. Horticultural crops can also be affected by changes in temperature and seasonal climatic conditions. Changing temperatures also have significant implications for **water resources**. Higher temperatures can increase evaporation from reservoirs, rivers, lakes, and agricultural fields. When combined with irregular rainfall, this may intensify seasonal water scarcity. Maharashtra's dependence on monsoon rainfall makes the relationship between temperature, precipitation, drought, and water availability particularly important. Changes in temperature can therefore influence irrigation requirements, drinking-water availability, groundwater conditions, and water-management practices. Another important consequence of increasing temperature is the growing risk of heat waves and heat-related health problems. High temperatures can cause heat stress, dehydration, heat exhaustion, and other health problems, particularly among elderly people, children, outdoor workers, agricultural labourers, and economically vulnerable populations. Urban areas may experience additional heat stress because of the urban heat-island effect. Therefore, understanding temperature trends is important not only from an environmental perspective but also from a public-health and disaster-management perspective. Temperature changes can also influence forest ecosystems and wildfire risk. Higher temperatures combined with dry conditions can reduce vegetation moisture and increase the susceptibility of forests and grasslands to fire. Maharashtra contains important forest regions in the Western Ghats, Vidarbha, and other parts of the state. Changes in temperature, rainfall, vegetation conditions, and human activities may collectively influence the spatial and seasonal distribution of forest fires. Thus, the study of temperature trends can also contribute to understanding emerging environmental hazards.

From a geographical perspective, the study of changing temperature trends requires both temporal and spatial analysis. Temporal analysis helps identify whether temperature has increased or decreased over a particular period, while spatial analysis helps determine which regions are experiencing greater changes. Long-term meteorological records, satellite-derived land surface temperature data, rainfall records, and GIS and remote-sensing techniques can be used to investigate these variations. Statistical methods such as trend analysis, moving averages, correlation, regression, and analysis of temperature

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

anomalies can further help identify significant changes.

Objective-

- To examine the long-term temperature trends in Maharashtra and identify changes in annual and seasonal temperatures.
- To analyse the spatial and temporal variations in maximum and minimum temperatures across different geographical regions of Maharashtra.
- To study the relationship between changing temperature patterns and climate change, particularly in relation to heat waves and extreme temperature events.
- To assess the environmental and socio-economic impacts of rising temperatures on agriculture, water resources, forests, biodiversity, and human health in Maharashtra.
- To suggest suitable climate-change adaptation and mitigation measures for reducing the adverse effects of changing temperature trends in Maharashtra.
- **Hypothesis-**
- **H_1:** There is a significant increasing trend in the average annual temperature of Maharashtra over the study period.
- **H_2:** The maximum temperature in Maharashtra has increased significantly over the study period.
- **H_3:** The minimum temperature in Maharashtra has increased significantly over the study period.
    - **H_4:** There is a significant spatial variation in temperature trends among different regions of Maharashtra, including Konkan, Western Maharashtra, Marathwada, and Vidarbha.
    - **H_5:** The frequency and intensity of extreme heat events and heat waves have increased in Maharashtra over time.
    - **H_6:** Rising temperatures are significantly associated with changes in rainfall patterns and climatic variability in Maharashtra.
    - **H_7:** Increasing temperature has a significant negative impact on agricultural productivity and crop-growing conditions in Maharashtra.
    - **H_8:** Rising temperatures significantly increase water stress and evaporation losses, particularly in drought-prone regions of Maharashtra.

Study Area- Maharashtra is one of the major states of western and central India and provides an important geographical setting for studying **changing temperature trends and climate change**. The state lies approximately between **15°35′ N and 22°02′ N latitudes and 72°36′ E and 80°54′ E longitudes**. It is bordered by the **Arabian Sea to the west**, Gujarat and Madhya Pradesh to the north, Chhattisgarh to the east, Telangana to the southeast, Karnataka to the south, and Goa to the southwest. Maharashtra covers approximately **307,713 km²**, making it one of India's largest states by geographical area. Its large geographical extent and considerable variations in relief, elevation, rainfall, vegetation, urbanization, and land use make it suitable for analysing spatial and temporal variations in temperature.

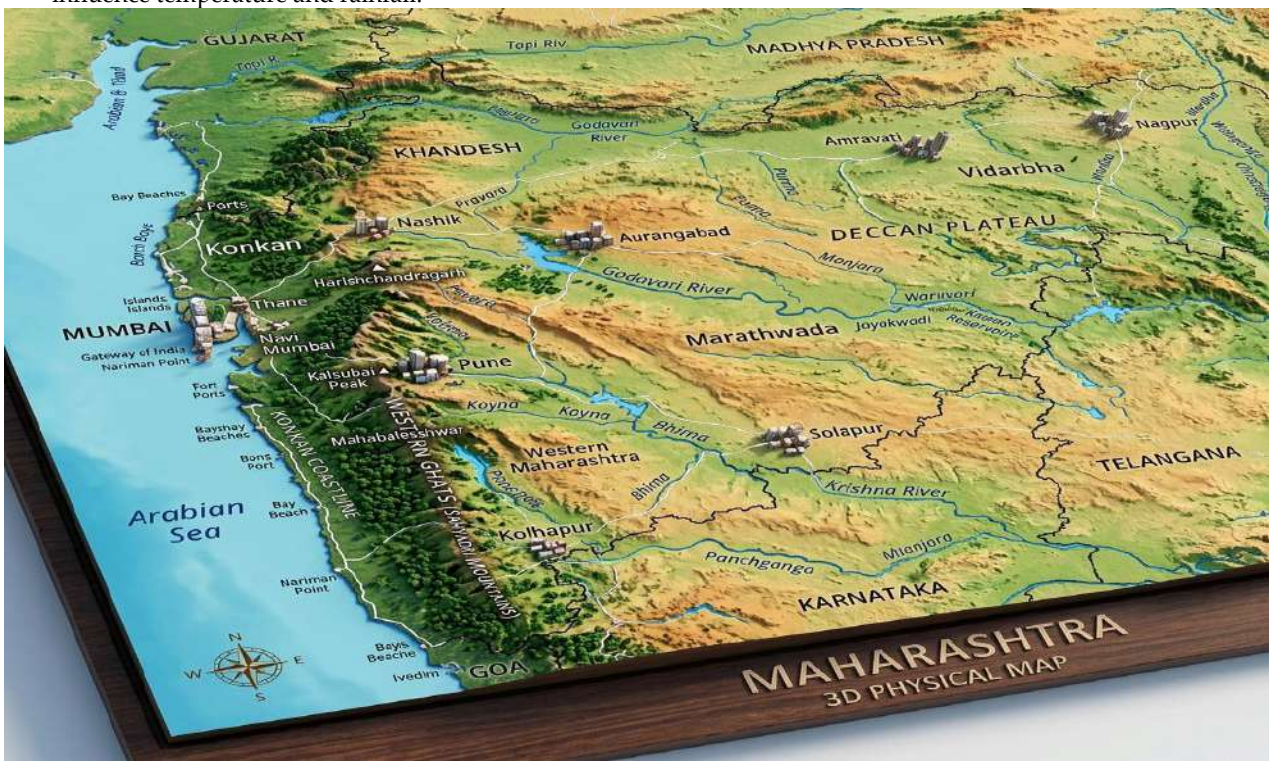
Physiographic Division

The physical geography of Maharashtra can broadly be divided into several important regions:

- **Konkan Coastal Region:** Located between the Arabian Sea and the Western Ghats. It has a humid climate, relatively high rainfall, and strong maritime influence.
- **Western Ghats (Sahyadri):** A major mountain system extending through the western part of the state. Elevation and orographic effects influence temperature and rainfall.
- **Maharashtra Plateau:** The interior plateau has relatively moderate to high temperatures and comparatively lower rainfall than the Konkan region.
- **Marathwada:** A predominantly semi-arid region characterized by high summer temperatures, irregular rainfall, and frequent drought conditions.
- **Vidarbha:** Located in eastern Maharashtra, it experiences high summer temperatures and considerable seasonal climatic variation.



Climate

Maharashtra has a tropical monsoon climate, but climatic conditions vary significantly across the state. The major seasons are generally:

1. Summer**:** March to May
2. Southwest Monsoon**:** June to September
3. Post-monsoon/Retreating Monsoon**:** October to November
4. Winter**:** December to February

Summer temperatures can become particularly high in Vidarbha, Marathwada, and interior Maharashtra, whereas coastal areas generally experience relatively moderated temperatures because of the influence of the Arabian Sea.

The southwest monsoon is the principal source of rainfall. The Western Ghats receive very high rainfall, while the areas lying in the rain-shadow region receive considerably less. This variation in rainfall interacts with temperature and creates different levels of climatic vulnerability across Maharashtra.

Changing Temperature Trends and Climate Change in Maharashtra, 2010–2026

For a research paper, it is important not to mix Maharashtra data with all-India temperature data**.** The India Meteorological Department (IMD), Pune is the appropriate primary source for Maharashtra state-level temperature data. IMD's state climate statements provide annual state-averaged maximum, minimum and mean land-surface air temperatures and their anomalies.

Regional Temperature Change Rates (per year)

Region	Max Temp Rate Change (°C/yr)	Min Temp Rate Change (°C/yr)	Primary Reference PDF
Vidarbha	+0.0126	+0.0138	Spatio-Temporal Analysis PDF
Marathwada	+0.0118	+0.0122	Spatio-Temporal Analysis PDF
Konkan / Coastal	+0.0121	+0.0120	Spatio-Temporal Analysis PDF
Western Maharashtra	+0.0115	+0.0119	Spatio-Temporal Analysis PDF

IMD Pune Climatological Tables 1991-2020

1. Vidarbha-Vidarbha shows the highest temperature increase among the four regions. Maximum temperature is increasing at **0.0126°C/year**, while minimum temperature is increasing at **0.0138°C/year**. This means that over a 10-year period, the estimated increase would be approximately. The relatively higher increase in minimum temperature suggests that **night-time temperatures are warming faster than daytime temperatures**, which can reduce the daily temperature range.

2. Marathwada-Marathwada records a maximum-temperature increase of **0.0118°C/year** and a minimum-temperature increase of **0.0122°C/year**.

Over 10 years, this corresponds approximately to: The relatively close values indicate a **fairly uniform warming trend** in both maximum and minimum temperatures.

3. Konkan / Coastal Maharashtra-The Konkan/coastal region has a maximum-temperature warming rate of **0.0121°C/year** and a minimum-temperature rate of **0.0120°C/year**.The difference between the two rates is very small. Therefore, the region demonstrates a balanced increase in both daytime and night-time temperatures. Coastal influence, high humidity, and proximity to the Arabian Sea can influence the regional temperature pattern.

4. Western Maharashtra-Western Maharashtra has the **lowest maximum-temperature warming rate**, at **0.0115°C/year**, while its minimum temperature increases at **0.0119°C/year**.Over 10 years, the estimated warming would be approximately:

Although it has the lowest rate among the four regions, the positive trend still indicates **persistent regional warming**.

Comparative Analysis- A key feature of the data is that **minimum temperatures are rising faster than maximum temperatures in Vidarbha, Marathwada, and Western Maharashtra**:Vidarbha: Minimum exceeds maximum rate by **0.0012°C/year** Marathwada: **0.0004°C/year** Western Maharashtra: **0.0004°C/year** Konkan: Maximum exceeds minimum rate slightly by **0.0001°C/year**.Thus, **Vidarbha has the strongest indication of increasing night-time temperatures**.

Problems of Changing Temperature Trends-Changing temperature trends refer to long-term changes in average temperatures, including rising maximum and minimum temperatures, increasing frequency of heat waves, and greater temperature variability. These changes create serious environmental, social, agricultural, health, and economic problems.

1. Increase in Heat Waves

Rising temperatures increase the frequency, intensity, and duration of **heat waves**. Extreme heat can create dangerous conditions for human health, agriculture, livestock, and outdoor workers.

2. Decline in Agricultural Productivity

Higher temperatures can adversely affect crop growth, flowering, pollination, and grain formation. Heat stress can reduce crop yields and affect food security, particularly in temperature-sensitive crops.

3. Water Scarcity

Increasing temperatures accelerate **evaporation** from soil, rivers, reservoirs, and other water bodies. This increases water requirements for agriculture and domestic use and can intensify water shortages.

4. Increase in Drought Conditions

High temperatures combined with irregular rainfall can increase the severity of drought. Regions that already experience water stress are particularly vulnerable.

5. Adverse Effects on Human Health

Changing temperature trends can increase the risk of:

- Heat exhaustion
- Heat stroke
- Dehydration
- Cardiovascular problems
- Respiratory problems
- Heat-related mortality

Children, elderly people, outdoor workers, and vulnerable communities are particularly exposed.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

6. Rising Night-Time Temperatures
An increase in **minimum or night-time temperatures** is an important concern. When temperatures remain high at night, the human body gets less opportunity to recover from daytime heat, increasing heat stress.

7. Impact on Livestock
High temperatures cause **heat stress in livestock**, which can reduce feed intake, milk production, reproductive performance, and overall animal health. This can negatively affect farmers dependent on dairy and livestock activities.

8. Loss of Biodiversity
Changes in temperature can disturb the natural habitats and ecological cycles of plants and animals. Changes in flowering, breeding, migration, and food availability can affect biodiversity and ecosystem stability.

9. Increase in Forest Fire Risk
Higher temperatures combined with dry vegetation and low soil moisture can increase the probability and severity of **forest fires**. Forest fires cause biodiversity loss, soil degradation, air pollution, and destruction of habitats.

10. Urban Heat Island Effect
Rapid urbanization, concrete structures, reduced vegetation, traffic, and industrial activities can increase temperatures in cities. This creates the **Urban Heat Island (UHI)** effect and makes cities considerably warmer than surrounding rural areas.

11. Increased Energy Demand
Higher temperatures increase the use of fans, air conditioners, refrigerators, and cooling systems. Consequently, electricity consumption and pressure on power infrastructure increase.

12. Changes in Rainfall Patterns
Changing temperature patterns can contribute to changes in the hydrological cycle. Rainfall may become more irregular, with periods of intense rainfall followed by prolonged dry periods. This can increase the risk of both **floods and droughts**.

13. Reduction in Soil Moisture
Higher temperatures increase evaporation and evapotranspiration, reducing soil moisture. Low soil moisture negatively affects crop growth, groundwater recharge, and soil quality.

14. Economic Losses
Temperature changes can reduce productivity in agriculture, construction, manufacturing, and other outdoor activities. Damage to crops, livestock, infrastructure, and natural resources can result in substantial economic losses.

15. Reduced Labour Productivity
Extreme heat can reduce the ability of workers to perform physically demanding activities. Outdoor workers may need more frequent breaks and shorter working hours, leading to reduced productivity and income.

16. Food Security Problems
Reduced agricultural production caused by heat stress, drought, and water shortages can threaten food availability. Lower supply may also contribute to increases in the prices of food grains, fruits, and vegetables.

17. Changes in Plant Growth
Temperature changes can alter the timing of **flowering, fruiting, germination, and leaf fall**. Such changes can disturb agricultural calendars as well as natural ecosystems.

18. Increased Pest and Disease Problems
Changing temperature conditions can influence the distribution, reproduction, and survival of agricultural pests and disease-causing organisms. Consequently, some crops may face increased pest and disease pressure.

19. Pressure on Natural Resources
Increasing temperatures place additional pressure on **water, forests, soil, agricultural land, and biodiversity**. Unsustainable exploitation of these resources can further increase environmental degradation.

20. Social and Regional Inequality
The impacts of temperature change are not equally distributed. Poor households, agricultural communities, informal workers, and regions with limited water and health infrastructure are often more vulnerable.

Methods of controlling Changing Temperature Trends and Climate Change in Maharashtra-
Climate change and changing temperature trends have become major environmental and developmental challenges for Maharashtra. The state has diverse geographical conditions, including the Konkan coast, Western Ghats, semi-arid regions of Marathwada and the hotter areas of Vidarbha. Rising temperatures, heat waves, irregular rainfall, droughts, floods, changing agricultural conditions and coastal hazards are increasingly affecting the state's natural resources and human activities. The Government of Maharashtra recognizes these risks and has adopted climate adaptation and mitigation measures through its State Action Plan on Climate Change (SAPCC).
Controlling climate change does not mean that temperature variation can be eliminated completely. Rather, the objective is to reduce greenhouse-gas emissions, increase carbon

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

absorption, conserve natural resources and strengthen the capacity of communities to adapt to unavoidable climate impacts.

1. Promotion of Renewable Energy

One of the most important methods of controlling climate change is reducing dependence on fossil fuels such as coal and petroleum. Maharashtra should promote solar, wind, biomass and other renewable energy sources.

Solar energy can be particularly important in rural Maharashtra. Solar-powered agricultural pumps, rooftop solar systems and decentralized renewable-energy systems can reduce dependence on conventional electricity. Maharashtra has also adopted a Renewable Energy and Energy Storage Policy for 2025–26 to 2035–36, providing a policy framework for expanding renewable energy and storage.

2. Afforestation and Forest Conservation

Forests act as important carbon sinks by absorbing carbon dioxide from the atmosphere. Therefore, increasing forest cover and protecting existing forests are essential measures.

Forest and biodiversity conservation are important components of Maharashtra's climate action framework.

3. Climate-Smart Agriculture

Agriculture is highly vulnerable to increasing temperature and changing rainfall. Maharashtra should therefore promote climate-smart agriculture. These methods can help farmers reduce production losses caused by heat, drought and irregular rainfall.

4. Efficient Water Management

Increasing temperature increases evaporation and agricultural water requirements. Water conservation should therefore become a major component of climate-change adaptation.

Water management is particularly important in drought-prone areas of **Marathwada and Vidarbha**. Maharashtra's climate planning identifies water resources as a priority sector.

5. Development of Heat-Resistant Crops

Rising temperatures can negatively affect crop growth, flowering and yield. Agricultural universities and research institutions should develop and distribute crop varieties that can tolerate:

6. Reduction of Greenhouse-Gas Emissions

Controlling greenhouse-gas emissions is essential for reducing long-term climate change. Maharashtra should reduce emissions from:

Energy efficiency, renewable energy, cleaner technologies and sustainable production systems should be promoted.

7. Sustainable Transportation

Rapid growth in vehicles contributes to air pollution and greenhouse-gas emissions. Maharashtra should encourage:

Sustainable transport is also included among the sectors considered in the revised state climate-action framework.

8. Sustainable Urban Development

Cities such as Mumbai, Pune, Thane, Nagpur and Nashik are vulnerable to urban heat because of concrete surfaces, traffic, buildings and limited vegetation.

Urban climate-control measures should include:

Such measures can reduce the **Urban Heat Island Effect** and improve the thermal comfort of urban populations.

9. Implementation of Heat Action Plans

Increasing temperatures require effective heat-wave preparedness. Maharashtra has a Heat wave Action Plan 2024, which emphasizes early warning, public-health preparedness, water and electricity availability, cooling centres and coordination among government agencies.

10. Protection of Water Bodies and Wetlands

Rivers, lakes, ponds and wetlands help maintain ecological balance and provide water during dry periods. Their protection should therefore be given priority.

Restoration of traditional water bodies can also improve local water security.

11. Prevention of Forest Fires

Higher temperatures and dry conditions can increase forest-fire risk. Maharashtra should strengthen:

Local communities should be involved in forest protection and fire prevention.

12. Energy Efficiency

Energy conservation can reduce both electricity demand and greenhouse-gas emissions. Maharashtra should promote:

Energy efficiency is especially important during periods of extreme heat when electricity demand for cooling increases.

13. Sustainable Industrial Development

Industries are major consumers of energy and natural resources. Industrial climate action should include:

Industrial development should be combined with environmental protection.

14. Sustainable Waste Management

Improper waste disposal contributes to environmental degradation and greenhouse-gas

Effective waste management can reduce methane emissions and improve urban environmental quality.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

15. Coastal and Mangrove Protection

Maharashtra has an extensive coastline and coastal communities are vulnerable to climate-related hazards. Mumbai, Thane, Raigad, Ratnagiri and Sindhudurg require particular

Mangroves are particularly valuable because they provide ecosystem services while helping protect coastal areas.

16. Climate-Resilient Infrastructure

Infrastructure should be designed according to present and future climate risks. Roads, bridges, buildings, drainage systems and other infrastructure should consider:

Climate-resilient infrastructure can reduce future economic losses.

17. Protection of Human Health

Changing temperatures create serious health risks, especially during heat waves. The state should strengthen:

The Maharashtra Heatwave Action Plan specifically emphasizes early warnings, hydration facilities, health preparedness and protection of vulnerable populations.

18. Climate-Resilient Livestock Management

Increasing temperatures also affect livestock. Farmers should be encouraged to provide:

Conclusion-

The study of Changing Temperature Trends and Climate Change in Maharashtra indicates that climate change is becoming an important environmental, economic and social challenge for the state. Analysis of historical climate data shows a rising tendency in annual average maximum and mean temperatures across Maharashtra. The state's climate projections also indicate that both daytime and night-time temperatures are expected to continue increasing in the coming decades. Under the RCP 4.5 scenario, mean daytime temperature is projected to increase by about **0.90°C**, while under RCP 8.5 the increase could reach about **1.56°C** during the 2030s.

The effects of these changing temperature trends are not uniform throughout Maharashtra. Vidarbha and Marathwada are particularly vulnerable to heat, drought and water scarcity, while the Konkan and coastal regions face additional risks from heavy rainfall, flooding, cyclones and sea-level-related hazards. Rapid urbanization in the Mumbai–Pune region also increases exposure to urban heat.

Increasing temperatures have significant consequences for agriculture, water resources, forests, biodiversity, livestock, human health and the economy. Higher temperatures increase evapotranspiration and water demand, intensify heat stress, affect crop productivity and may increase the frequency and severity of droughts. Climate variability can also create conditions for extreme rainfall, floods and other disasters. Therefore, climate change should be considered not only an environmental issue but also a major development and livelihood challenge.

Maharashtra has already established institutional and policy mechanisms to address these challenges. The **State Climate Action Cell**, established in 2023, coordinates climate initiatives and supports implementation of the State Action Plan on Climate Change (SAPCC), National Action Plan on Climate Change (NAPCC) and Mission LiFE. The revised SAPCC incorporates adaptation and mitigation measures across agriculture, water, forests and biodiversity, energy, habitat, public health, disaster management, transport and industries.

Acknowledgement

I would like to express my sincere gratitude to all those who contributed directly or indirectly to the completion of this research paper entitled "Changing Temperature Trends and Climate Change in Maharashtra." The study examines spatial and temporal variations in temperature across Maharashtra and their implications for agriculture, water resources, ecosystems, human health, and the economy. I am deeply thankful to the India Meteorological Department (IMD), Ministry of Earth Sciences, and the Government of Maharashtra, Environment and Climate Change Department, for providing valuable climatic information, reports, and policy-related resources that supported this study.

Abstract

India's vision of Vikshit Bharat @2047 rests on building a digitally empowered, innovation-driven, and sustainable economy in which artificial intelligence, e-commerce, and digital infrastructure serve as engines of inclusive growth. Realising this vision depends critically on the quality of human capital that education systems produce, and teacher education stands at the centre of that pipeline. This paper examines how the digital transformation envisaged under Vikshit Bharat @2047 is reshaping teacher education in India, using the reforms introduced under the National Education Policy (NEP) 2020 as the entry point. It discusses how national digital platforms such as DIKSHA, SWAYAM, and PM eVIDYA, together with emerging technologies including artificial intelligence, virtual and augmented reality, blockchain, and the Internet of Things, are creating new possibilities for personalised, inclusive, and lifelong teacher development. The paper also situates these developments within the wider digital economy, arguing that a technologically competent teaching workforce is a precondition for the commerce, innovation, and productivity gains that Vikshit Bharat @2047 anticipates. At the same time, the paper identifies significant risks, including the digital divide, uneven digital literacy among teachers, and adverse effects of excessive technology use on mental well-being, sleep, and attention. Drawing on secondary literature and policy documents, the paper proposes a blended and sustainability-oriented framework for teacher education that combines digital tools with face-to-face mentoring, structured digital wellness training, and continuous monitoring of technology use. It concludes that India's digital future will be strongest where digital ambition is matched with digital responsibility, and where teacher education is treated as strategic national infrastructure rather than a peripheral concern.

Keywords: *Vikshit Bharat @2047, Digital Economy, Artificial Intelligence, Teacher Education, NEP 2020, Sustainable Development, Innovation*

Introduction

India's development trajectory has entered a decisive phase in which digital technology is no longer a peripheral tool but the organising logic of economic and social policy. The Government of India's Vikshit Bharat @2047 vision, articulated to mark the centenary of independence, sets out an ambition for India to become a fully developed economy driven by innovation, digital infrastructure, sustainable growth, and an empowered citizenry (NITI Aayog, 2023). Central to this vision are five interlocking pillars that this paper takes as its frame of reference: artificial intelligence as a general-purpose technology reshaping productivity across sectors; a digital economy built on platforms, data, and financial inclusion; commerce that increasingly moves through digital and e-commerce channels; a national innovation ecosystem supported by start-ups and research; and a commitment to sustainable development that ensures growth does not come at the cost of equity or well-being. Every one of these pillars ultimately depends on people who can think critically, adapt to new tools, and use technology responsibly.

That human capital is produced, in large part, through the education system, and the education system is only as capable as the teachers who run it. This paper therefore argues that teacher education is not a side issue in India's digital transformation but one of its most consequential levers. It examines how national reforms and digital platforms are reshaping how teachers are trained, what opportunities and risks this creates, and what a sustainable model of technology-integrated teacher education could look like as India works toward 2047.

The Vikshit Bharat @2047 Vision and the Digital Imperative

Vikshit Bharat @2047 envisions India as a developed nation with a substantially larger economy, near-universal digital access, and a global leadership position in emerging technologies such as artificial intelligence, semiconductors, and clean energy. The vision explicitly links economic growth to digital public infrastructure of the kind India has already built through the India Stack, Unified Payments Interface, and Digital India programmes, which are widely cited as models of population-scale digital delivery (Ministry of Electronics and Information Technology, 2023). Building on this base, policy discourse around Vikshit Bharat increasingly treats artificial intelligence not as a narrow technical field but as a horizontal capability that will influence agriculture, manufacturing, healthcare, governance, and education alike. Within this framing, the digital economy and digital commerce pillars depend on a workforce that is comfortable with data, platforms, and automation, while the innovation pillar depends on a population that has been taught to question, experiment, and create rather than only memorise. Sustainable development, the fifth pillar, requires that this digital transition be inclusive rather than extractive, reaching rural and marginalised communities and protecting citizens' mental and social well-being rather than treating these as afterthoughts. Education is the mechanism through which all of these capacities are formed, and teachers are the primary agents through which education happens. A credible pathway to Vikshit Bharat @2047 must therefore include a credible pathway for transforming how India prepares its teachers.

NEP 2020 and the Reform of Teacher Education

Teacher education plays a crucial role in shaping the wider education system, and the National Education Policy (NEP) 2020 was designed with this in mind (Government of India, Ministry of Education, 2020). NEP 2020 aims to bring about a major shift by making teacher preparation more holistic, inclusive, and multidisciplinary, and it mandates several specific reforms toward this end. The most structurally significant is the move toward an integrated four-year Bachelor of Education (B.Ed.) programme that combines subject knowledge with pedagogical training from the outset, replacing the older, more fragmented model of teacher preparation. NEP 2020 also introduces National Professional Standards for Teachers (NPST), intended to create a consistent benchmark for what teachers at different career stages should know and be able to do (National Council for Teacher Education, 2021), and it places strong emphasis on Continuous Professional Development (CPD), much of which is delivered through digital platforms such as DIKSHA and SWAYAM. Taken together, these reforms are intended to standardise training, integrate technology into everyday teaching practice, and foster lifelong learning among teachers, replacing older, more static methods of teacher training with practices that are more consistent, technology-enabled, and future-oriented. In the context of Vikshit Bharat @2047, NEP 2020 can be read as the education-sector expression of the same underlying strategy visible in digital public infrastructure elsewhere in the economy: build a standardised digital backbone (DIKSHA, SWAYAM, NPST) on top of which decentralised innovation and personalisation can occur.

Digital Transformation in Teacher Education: Platforms and Emerging Technologies

The COVID-19 pandemic accelerated the digital transformation of teacher education in ways that were largely unplanned but proved formative. With physical classrooms closed, smartphones, e-learning platforms, and online resources rapidly became central to how teachers accessed training and how trainee teachers completed their coursework, a shift that was especially consequential in remote and rural areas where alternatives were limited. Government initiatives such as PM eVIDYA, DIKSHA, and SWAYAM expanded during this period to give teachers structured access to quality learning material, lesson plans, and assessment resources, effectively becoming the backbone of continuous professional development during the crisis (Ministry of Education, 2022).

Since the pandemic, this digital foundation has become the base on which a new generation of technologies is being layered. Artificial intelligence is beginning to be used for adaptive learning content, automated feedback on teaching practice, and early identification of students who may need additional support. Virtual and augmented reality

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

tools offer trainee teachers simulated classroom environments in which they can practise pedagogy before facing real students, reducing the risk associated with early-career mistakes. Blockchain technology is being explored for the secure, verifiable issuance of teaching credentials and CPD records, which is particularly relevant given NPST's emphasis on tracking teacher competency over a career. The Internet of Things (IoT), through connected classroom devices and sensors, offers the potential for real-time data on engagement and learning conditions. Collectively, these tools provide considerable potential for innovation, personalisation, and inclusivity in teacher education, and they map directly onto the artificial intelligence and innovation pillars of the Vikshit Bharat @2047 vision (UNESCO, 2021).

Linking Teacher Education to the Digital Economy, Commerce, and Innovation

The relationship between teacher education and the digital economy is not merely metaphorical. Teachers who are themselves digitally literate are far more likely to produce students who can participate productively in a digital and platform-driven economy, whether as consumers, employees, entrepreneurs, or innovators. A student population confident in using digital tools for learning is better prepared to engage with e-commerce platforms, digital financial services, and online marketplaces that increasingly define commerce in India. Similarly, an education system that models AI-assisted personalisation and problem-solving in the classroom is more likely to produce the kind of adaptable, technically literate graduates that India's innovation ecosystem, including its start-up sector, depends on (World Economic Forum, 2023). In this sense, teacher education functions as an upstream input into the digital economy in much the same way that reliable electricity or broadband functions as an upstream input into industry. Under-investment in teacher digital competence therefore represents a hidden constraint on the digital economy, commerce, and innovation pillars of Vikshit Bharat @2047, even though it rarely appears in economic policy discussions framed primarily around infrastructure, start-ups, or trade.

Risks and Challenges: The Cost of Digital Reliance

Alongside these opportunities, the growing digital reliance of teacher education presents major challenges that cannot be treated as secondary to the technology agenda. The first is unequal access to resources. Trainee teachers and in-service teachers in rural or economically disadvantaged areas often face unreliable internet connectivity, limited access to smartphones or computers, and irregular electricity supply, all of which constrain their ability to benefit from platforms such as DIKSHA and SWAYAM. The second challenge is a broader lack of digital skills among sections of the existing teaching workforce, particularly senior teachers trained under older systems, which can widen rather than narrow the gap between technologically confident and technologically hesitant educators. The third and perhaps least discussed challenge concerns the negative effects of technology overuse on mental well-being. Sustained exposure to screens and constant connectivity through professional development platforms, messaging groups, and online assessment systems can contribute to smartphone addiction, elevated stress, disrupted sleep, and decreased attention among teachers, with corresponding effects on students who model teachers' relationship with technology. A digital transformation strategy that ignores these effects risks producing short-term gains in access and content delivery while incurring longer-term costs in teacher burnout and reduced instructional quality, both of which would undermine rather than support the human-capital goals of Vikshit Bharat @2047. These risks matter directly to the sustainable development pillar of the Vikshit Bharat @2047 vision, which explicitly frames growth as something that must be equitable and humane rather than purely quantitative. A digital strategy for teacher education that widens regional inequality or damages teacher well-being would be, by the vision's own logic, an unsustainable strategy, regardless of how impressive its technology adoption metrics might appear.

A Blended and Sustainable Framework for Technology-Integrated Teacher Education

Addressing these risks while retaining the benefits of digital transformation requires a deliberately blended and sustainability-oriented approach, rather than an assumption that more technology is automatically better. Several strategies follow from the analysis above.

- Blended learning models that combine online tools with structured face-to-face interaction, mentoring, and classroom practice, so that digital platforms supplement rather than replace human guidance in teacher preparation.
- Structured digital wellness training embedded within CPD programmes, teaching trainee and in-service teachers how to manage screen time, set boundaries around always-on professional communication, and recognise early signs of digital fatigue.
- Curriculum reforms aligned with NEP 2020 that treat digital competence, data literacy, and

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

responsible AI use as core professional standards under NPST, rather than optional add-ons.
- Mindfulness and mental health programmes integrated into teacher education institutions, recognising that teacher well-being is a precondition for effective teaching, not a separate HR concern.
- Monitoring systems for responsible technology use, including institutional guidelines on reasonable working hours around digital platforms and periodic review of how much time CPD requirements actually demand of teachers.
- Targeted infrastructure investment prioritising rural and underserved regions, ensuring that DIKSHA, SWAYAM, and PM eVIDYA close the digital divide rather than widen it, in line with the inclusive-growth logic of Vikshit Bharat @2047.

In the twenty-first century, teachers do more than transmit subject knowledge; they also foster the emotional and social development of their students, a role that becomes more, not less, important as classrooms become more technologically mediated. It is therefore necessary to equip teachers with a combined profile of technological competence, teaching flexibility, adaptability, empathy, and practical strategies for maintaining their own mental health. A teacher education system that develops this combined profile is far more likely to produce the kind of workforce that Vikshit Bharat @2047 requires.

Conclusion

Vikshit Bharat @2047 sets out an ambitious vision in which artificial intelligence, the digital economy, commerce, and innovation drive India toward developed-nation status by the centenary of independence, with sustainable development ensuring that this growth is equitable and humane. This paper has argued that teacher education is an essential, if underappreciated, foundation for that vision. Reforms under NEP 2020, together with national platforms such as DIKSHA, SWAYAM, and PM eVIDYA, are already reshaping how India's teachers are trained, and emerging technologies including artificial intelligence, virtual and augmented reality, blockchain, and IoT offer genuine potential for personalised, inclusive, and lifelong professional development. At the same time, unequal access, digital skill gaps, and the mental health costs of digital overuse represent real risks that, left unaddressed, would undermine the very goals the digital transformation is meant to serve. With strong and equitably distributed digital infrastructure, a blended approach to teacher learning, and a conscious, sustained focus on digital wellness alongside digital skills, India's teacher education system can become well-prepared for the future, globally competitive, and responsive to the diverse needs of its learners. In doing so, it would provide the human-capital foundation on which the broader promise of Vikshit Bharat @2047, spanning artificial intelligence, the digital economy, commerce, innovation, and sustainable development, ultimately depends.

Acknowledgement

I would like to express my sincere gratitude to all those who contributed directly or indirectly to the completion of this research paper titled "Digital Transformation of Teacher Education under Vikshit Bharat @2047." I am deeply thankful to the Government of India and the Ministry of Education for providing valuable policy frameworks and initiatives, particularly the National Education Policy (NEP) 2020, which has guided the discussion on the transformation of teacher education. I also acknowledge the contribution of national digital initiatives such as DIKSHA, SWAYAM, and PM eVIDYA, which have strengthened opportunities for continuous professional development and technology-enabled learning.

Financial support and Sponsorship

Abstract

Generative Artificial Intelligence (GenAI) has increasingly become part of the academic, professional and problem-solving activities of young adults. While such tools provide rapid assistance, their frequent or premature use may influence how extensively individuals independently engage with challenging tasks. This study examines Generative AI dependence, productive struggle and independent skill development among young adults. Primary data were obtained through a structured questionnaire from 394 young adults residing in Mumbai City. Purposive sampling was adopted and responses were assessed using a five-point Likert scale. Descriptive statistics, Cronbach's Alpha, Simple Linear Regression and Pearson's Correlation were used for analysis. The findings indicate relatively high Generative AI dependence (Mean = 3.58), moderate productive struggle (Mean = 3.07) and relatively positive independent skill development (Mean = 3.71). Regression analysis revealed a significant but very weak positive relationship between Generative AI dependence and productive struggle ($\beta = 0.104$, $p = 0.045$, $R^2 = 0.010$). Productive struggle also demonstrated a significant positive relationship with independent skill development ($r = 0.271$, $p < 0.001$). The study highlights the importance of balanced Generative AI use while preserving opportunities for independent thinking, persistence and problem-solving.

Keywords: *Generative AI, AI Dependence, Productive Struggle, Independent Skill Development, Young Adults*

Introduction

Generative Artificial Intelligence has quickly emerged as an important tool for generating information, ideas, explanations and solutions. Applications including ChatGPT, Gemini and Microsoft Copilot are increasingly being used by young adults for academic, professional and personal activities. The accessibility and speed of these tools offer significant opportunities for learning and productivity. However, increasing AI use also raises questions about how individuals approach difficult tasks. Learning often involves attempting problems independently, making mistakes, exploring alternatives and persisting until a solution is reached. This process of constructive effort may be referred to as productive struggle. Such engagement can provide opportunities to develop problem-solving ability, independent thinking and confidence. Generative AI can support this process by providing explanations, feedback and alternative approaches. However, when AI assistance is sought before an individual makes an independent attempt, it may change the nature of engagement with the task. Therefore, the issue is not simply the frequency of Generative AI use but also the manner and stage at which it is used. The present study examines Generative AI dependence, productive struggle and independent skill development among young adults.

How to cite this article:
Chogale, R. R., & Chaurasiya, J. S. (2026). The Vanishing Struggle: Examining the Impact of Generative AI Dependence on Productive Struggle and Independent Skill Development Among Young Adults. Bulletin of Nexus, 3(9(I)), 201–210. https://doi.org/10.5281/zenodo.22721462

It specifically investigates whether Generative AI dependence is significantly related to productive struggle and whether productive struggle is significantly related to independent skill development. The study focuses on young adults residing in Mumbai City and provides an empirical perspective on AI-assisted problem-solving behaviour.

Literature review

Arvynth and Geeta (2024) examined the effects of Artificial Intelligence on academics among higher-education students in India. The study investigated students' experiences with AI tools including ChatGPT and other AI platforms, focusing on academic achievement, engagement and educational experiences. The findings indicated that AI has become increasingly relevant in higher education and can influence students' academic experiences and engagement. The study emphasizes the increasing integration of AI into higher education and the importance of understanding its implications for students' learning processes.

Pasupuletti and Thiyyagura (2024) examined the continuance and recommendation intention of ChatGPT among higher-education students in India. Using data from 307 students, particularly engineering students, the study employed Structural Equation Modelling to examine the proposed relationships. The results showed that perceived usefulness, attitude and satisfaction significantly influenced students' intention to continue using ChatGPT, while satisfaction and continuance intention influenced their recommendation intention. The study highlights the role of perceived usefulness and positive experiences in sustaining

Chawla, Mohnot, and Singh (2024) investigated students' application and adoption of ChatGPT in educational settings. The study examined factors including perceived pedagogy, perceived amplification, perceived ingenuity and perceived ethics in shaping students' perceptions and adoption intentions. The results indicated that these factors contribute to students' perceptions of ChatGPT and its potential role in enhancing educational practices. The study highlights that students' interaction with Generative AI is influenced not only by its availability but also by how they perceive its educational value and functionality.

Rana and Rai (2025) examined ChatGPT adoption among 402 students from Indian universities using an extended UTAUT2 framework and Structural Equation Modelling. The research revealed that the extended UTAUT2 factors positively influenced students' intention to adopt ChatGPT, while adoption intention positively influenced actual ChatGPT usage behaviour. The findings highlight the importance of students' perceptions and behavioural intentions in determining the extent to which ChatGPT becomes integrated into higher-education activities.

Singh, Singh, and Kaur (2025) examined ChatGPT adoption among higher-education students in Punjab, India, using the UTAUT2 model. Information was obtained from students in Punjab, with 313 responses forming the final analysis. The results indicated that performance expectancy, social influence, hedonic motivation, habit and facilitating conditions significantly influenced behavioural intention to use ChatGPT, while habit and behavioural intention positively influenced actual usage. The study demonstrates that habitual use and perceived usefulness may have an important role in shaping students' continued interaction with ChatGPT.

Statement of Problem:

The increasing use of Generative AI has made it easier for young adults to complete academic and professional tasks. While these tools provide quick assistance, excessive dependence on Generative AI may reduce the effort individuals make to understand, attempt, and solve challenging tasks independently. This raises concerns about the gradual decline of **productive struggle**, which involves persistence, trial and error, and independent problem-solving. If such effort is reduced, it may affect the development of independent skills among young adults. Therefore, the present study examines whether dependence on Generative AI is associated with reduced productive struggle and how productive struggle relates to independent skill development.

Significance of study

The study is significant because it focuses on the learning process behind AI-assisted task completion, rather than only examining the benefits or frequency of Generative AI use. It can help students and young adults understand the importance of maintaining independent thinking and problem-solving skills while using AI. The findings may help educators and institutions develop appropriate guidelines for responsible and purposeful use of Generative AI. The study may also contribute to the growing academic discussion on AI dependence, productive struggle, and independent skill development, and provide a foundation for future research scope on the long-term impact of Generative AI on human skills.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Objectives:

1. To assess the level and pattern of Generative AI dependence among young adults.
2. To examine the relationship between Generative AI dependence and productive struggle among young adults.
3. To evaluate the relationship between productive struggle and independent skill development among young adults.

Hypothesis

Based on the objectives of the study, the following hypotheses have been formulated:

H_{01}: There is no significant relationship between Generative AI dependence and productive struggle among young adults.

H_{11}: There is a significant relationship between Generative AI dependence and productive struggle among young adults.

H_{02}: There is no significant relationship between productive struggle and independent skill development among young adults.

H_{12}: There is a significant relationship between productive struggle and independent skill development among young adults.

Research Methodology:

Research Design

The study adopts a quantitative and empirical research design to examine the relationships among Generative AI dependence, productive struggle and independent skill development.

Sample Selected

The sample for the study comprises **young adults residing in Mumbai City** who have experience using Generative AI tools such as ChatGPT, Gemini, Microsoft Copilot and similar applications. The study focuses on understanding their level of Generative AI dependence, productive struggle and independent skill development.

Sampling Method

The study adopts a purposive sampling technique for collecting primary data. Respondents were selected on the basis of their relevance to the study, particularly their familiarity with and usage of Generative AI tools.

Sample Size

For this study, a total of 394 respondents from Mumbai City were selected for collecting primary data.

Sources of Data Collection

The study draws on both primary and secondary data. Primary data forms the major source of information, while secondary data is used to establish the conceptual and theoretical foundation of the study.

Primary Data

Primary data were obtained through a structured questionnaire administered using Google Forms. The questionnaire comprised statements measured on a five-point Likert scale, ranging from *Strongly Disagree* to *Strongly Agree*. The questionnaire was designed in accordance with the three research objectives and focuses on Generative AI dependence, productive struggle and independent skill development among young adults.

Secondary Data

Secondary data were obtained from relevant research papers, academic journals, books, reports, institutional publications and credible online sources related to Generative AI, artificial intelligence dependence, productive struggle, independent learning, skill development and cognitive engagement. Secondary sources were utilized to develop the conceptual framework, identify the research gap and support the interpretation of the findings.

Data Analysis and Interpretation

The present study examines the relationship between Generative AI dependence, productive struggle and independent skill development among young adults. Primary data were obtained through a structured questionnaire administered using Google Forms. A total of 394 responses were considered for the analysis.

The collected data were analyzed using descriptive and inferential statistical techniques. Frequency and percentage analysis were employed to understand the demographic and Generative AI usage profile among the respondents. Mean and standard deviation were used for assessing the responses to the Likert-scale statements. Cronbach's Alpha was employed to evaluate the internal consistency of the measurement scales. Simple Linear Regression was employed to examine the impact of Generative AI dependence on productive struggle, while Pearson's Correlation was employed to assess the relationship between productive struggle and independent skill development.

The Likert-scale statements were measured on a five-point scale:

1 = Strongly Disagree
2 = Disagree
3 = Neutral

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

4 = Agree
5 = Strongly Agree

Demographic Profile of Respondents

Table 1: Age-wise Distribution of Respondents

Age Group	Frequency	Percentage
18–20 years	163	41.37%
21–24 years	105	26.65%
25–30 years	108	27.41%
Above 30 years	18	4.57%
Total	**394**	**100.00%**

Interpretation

Table 1 shows that the largest proportion of respondents belongs to the 18–20 year age group, representing 41.37% of the total sample. Respondents in the 25–30 years age group constitute 27.41%, while 26.65% belong to the 21–25 years age group. Only 4.57% of the respondents are above 30 years.

The sample therefore predominantly represents respondents within the young adult age range, making it relevant to the focus of the present study.

Table 2: Educational Level of Respondents

Educational Level	Frequency	Percentage
Undergraduate	211	53.55%
Working	117	29.70%
Postgraduate	55	13.96%
Professional Course	11	2.79%
Total	**394**	**100.00%**

Interpretation

Table 2 shows that 53.55% of the respondents are undergraduate students, making them the largest category. Working respondents account for 29.70%, followed by postgraduate respondents at 13.96%. Respondents pursuing professional courses constitute 2.79%.

The substantial representation of undergraduate and working respondents provides insights into individuals who are likely to use Generative AI in both academic and professional contexts.

Generative AI Usage Pattern

Table 3: Frequency of Generative AI Usage

Frequency of Usage	Frequency	Percentage
Several times a day	223	56.60%
A few times a week	57	14.47%
Once a day	41	10.41%
Occasionally	38	9.64%
Rarely	35	8.88%
Total	**394**	**100.00%**

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Interpretation

According to the data presented, a high level of Generative AI usage is observed among respondents. 56.60% of respondents reported using Generative AI several times a day, while 14.47% reported using it a few times a week and 10.41% once a day.

Overall, approximately 81.47% of respondents use Generative AI either several times a day or at least once a day. This reflects that Generative AI has become a regular component of the respondents' academic, professional or personal activities.

Purpose of Generative AI Usage

The questionnaire included a question regarding the purpose for which respondents use Generative AI. Since respondents could indicate multiple purposes, the responses were treated as a multiple-response question.

Table 4: Purpose of Generative AI Usage

Purpose	Responses	Percentage of Respondents
Academic/Educational Tasks	157	39.85%
Problem-Solving and Analysis	134	34.01%
Professional/Work-related Tasks	109	27.66%
Personal Use	77	19.54%
Generating Ideas/Brainstorming	26	6.60%
Writing and Editing	21	5.33%
Other	7	1.78%

Interpretation

According to the results in Table 4, academic and educational tasks are the most frequently reported purpose of Generative AI usage, selected by 39.85% of respondents. This is followed by problem-solving and analysis at 34.01% and professional or work-related tasks at 27.66%.

The results suggest that Generative AI is mainly used for learning, problem-solving and task-related activities, rather than being restricted to personal or recreational purposes.

Stage of Generative AI Usage for Difficult Tasks

Table 5: Stage at Which Generative AI Is Used

Stage of Usage	Frequency	Percentage
Before attempting the task myself	152	38.58%
When unable to solve the task independently	76	19.29%
Mainly for checking or improving the final answer	72	18.27%
After making an initial attempt	49	12.44%
After trying multiple approaches	45	11.42%
Total	**394**	**100.00 %**

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Interpretation

The data in Table 5 reveal that 38.58% of respondents use Generative AI before attempting a difficult task themselves. This is an important finding with regard to the concept of productive struggle, as it suggests an AI-first approach among a considerable proportion of respondents. Approximately 19.29% seek AI help only when they are unable to solve a task independently, while 12.44% use AI after making an initial attempt and 11.42% after trying multiple approaches.

The results demonstrate considerable variation in the point at which respondents introduce Generative AI into the problem-solving process.

Descriptive Analysis of Research Variables

For the purpose of statistical analysis, the questionnaire statements were classified into three principal constructs:

Generative AI Dependence

Four statements were used to measure Generative AI dependence.

Productive Struggle

Three statements were used to measure respondents' willingness to independently attempt, understand and persist with difficult tasks.

Independent Skill Development

Four statements were used to measure perceived development of independent problem-solving, thinking, critical evaluation and confidence.

The statement relating to the use of Generative AI instead of spending additional time solving a difficult task independently was treated separately as a behavioural indicator because it specifically captures AI substitution behaviour.

Table 6: Descriptive Statistics of Major Constructs

Construct	Number of Items	Mean	Standard Deviation
Generative AI Dependence	4	3.58	1.01
Productive Struggle	3	3.07	1.03
Independent Skill Development	4	3.71	1.04

Interpretation

The mean score for Generative AI Dependence is 3.58, indicating a relatively high level of dependence among respondents.

The mean score for Productive Struggle is 3.07, indicating a moderate tendency among respondents to independently attempt and persist with difficult tasks.The mean score for Independent Skill Development is 3.71, indicating a relatively positive perception of independent skill development among respondents.

Overall, the results indicate that respondents demonstrate high Generative AI dependence, moderate productive struggle and relatively positive perceptions of independent skill development.

Item-wise Analysis

Table 7: Item-wise Mean Scores

Statement	Mean	SD
Generative AI is used whenever respondents face a difficult task	3.79	1.32
Generative AI assistance is sought before attempting certain tasks independently	3.47	1.24
Generative AI is used to generate ideas or solutions when initiating a task	3.75	1.19
Completing certain academic/professional tasks without Generative AI can be difficult	3.31	1.37
Difficult tasks are generally attempted independently before seeking AI assistance	2.99	1.26

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Sufficient effort is made to understand and solve challenging tasks before seeking assistance	3.14	1.14
Different approaches are explored when an initial attempt does not produce the desired result	3.06	1.19
Generative AI is often used instead of spending additional time solving a difficult task independently	3.66	1.23
Independent problem-solving ability is strengthened through attempts without immediate AI assistance	3.67	1.26
Independent thinking and idea generation are strengthened without complete reliance on AI	3.71	1.25
Critical evaluation develops through independent analysis rather than relying solely on AI	3.63	1.18
Regular engagement with challenging tasks contributes to confidence in performing tasks independently	3.85	1.20

Interpretation

The highest mean score is observed for the statement that regular engagement with challenging tasks contributes to greater confidence in performing academic or professional tasks independently (Mean = 3.85). This is followed by the statement relating to using Generative AI when respondents face a difficult task (Mean = 3.79) and using Generative AI to generate ideas or solutions (Mean = 3.75).

Among the productive-struggle statements, the lowest mean score is observed for independent attempts before seeking Generative AI assistance (Mean = 2.99). This finding is particularly relevant because it suggests that respondents may not consistently engage in independent attempts before turning to AI.

The statement regarding using Generative AI instead of spending additional time solving a difficult task independently records a mean of 3.66, indicating a relatively high level of agreement with this behaviour.

Analysis of AI Substitution Behaviour

Table 8: Use of Generative AI Instead of Independent Struggle

Statement: Generative AI is often used instead of spending additional time solving a difficult task independently.

Response	**Frequency**	**Percentage**
Strongly Disagree	30	7.61%
Disagree	44	11.17%
Neutral	73	18.53%
Agree	128	32.49%
Strongly Agree	119	30.20%
Total	**394**	**100.00%**

Interpretation

The results reveal that 62.69% of respondents either agree or strongly agree that Generative AI is often used instead of spending additional time solving a difficult task independently. This is an important finding in relation to the central theme of the study, as it indicates the presence of AI-substitution behaviour among a substantial proportion of respondents. Such behaviour may limit the amount of time individuals spend independently engaging with challenging tasks.

Reliability Analysis

Cronbach's Alpha was used to assess the internal consistency of the questionnaire items associated with each construct.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Table 9: Reliability Analysis

Construct	Number of Items	Cronbach's Alpha	Interpretation
Generative AI Dependence	4	0.794	Acceptable/Good
Productive Struggle	3	0.826	Good
Independent Skill Development	4	0.875	Very Good

Interpretation

The Cronbach's Alpha values for all three constructs are above the generally accepted threshold of 0.70, indicating satisfactory internal consistency.

The Generative AI Dependence scale has a Cronbach's Alpha of 0.794, indicating acceptable internal reliability. Productive Struggle has a reliability coefficient of 0.826, indicating good internal consistency. Independent Skill Development records the highest reliability coefficient of 0.875, indicating very good internal consistency.

Hypothesis 1

Null Hypothesis (H_{01})

Generative AI dependence does not have a significant impact on productive struggle among young adults.

Alternative Hypothesis (H_{11})

Generative AI dependence has a significant impact on productive struggle among young adults.

Statistical Test

Simple Linear Regression Analysis was applied.

- Independent Variable: Generative AI Dependence
- Dependent Variable: Productive Struggle
- Sample Size: 394

Hypothesis Testing

Table 10: Regression Analysis – Generative AI Dependence and Productive Struggle

Statistical Measure	Value
R	0.101
R^2	0.010
Adjusted R^2	0.008
F-value	4.048
Beta (β)	0.104
t-value	2.012
p-value	0.045

Interpretation

The regression analysis indicates a statistically significant relationship between Generative AI dependence and productive struggle at the 5% level of significance, as the p-value of 0.045 is less than 0.05.

The R^2 value of 0.010 indicates that Generative AI dependence explains approximately 1.02% of the variation in productive struggle. Therefore, although the relationship is **significant, its explanatory power remains very limited.**

The regression coefficient is positive (β = 0.104), indicating a weak positive association **between the two variables among the respondents.**

Decision

Since, p = 0.045 < 0.05 **the null hypothesis H_0 is rejected.**

Conclusion

Generative AI dependence has **a significant but very weak** relationship with productive struggle among the respondents. The low R^2 value indicates that **factors other than** Generative AI dependence account for **the majority of the variation** in productive struggle.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Hypothesis 2

Null Hypothesis (H_{02})

There is no significant relationship between productive struggle and independent skill development among young adults.

Alternative Hypothesis (H_{12})

There is a significant relationship between productive struggle and independent skill development among young adults.

Statistical Test

Pearson's Product-Moment Correlation **was employed to assess the** relationship between productive struggle and independent skill development.

Table 11: Correlation between Productive Struggle and Independent Skill Development

Variables	**Pearson's r**	**p-value**
Productive Struggle and Independent Skill Development	0.271	<0.001

Interpretation

The Pearson correlation coefficient is 0.271, indicating a positive relationship between productive struggle and independent skill development.

The p-value is below 0.001, which is lower than the significance level of 0.05. Therefore, the relationship is statistically significant.

The results suggest that respondents who report greater engagement in productive struggle also tend to report higher levels of independent skill development.

Decision

Since, $p < 0.05$ **the null hypothesis H_{02} is rejected.**

Conclusion

A statistically significant positive relationship exists between productive struggle and independent skill development among young adults.

Findings

The study found that Generative AI usage was high among respondents, with 56.60% reporting its use several times a day. Academic and educational tasks were the most commonly reported purpose of use (39.85%). Further, 38.58% reported using Generative AI before attempting a difficult task independently. Generative AI Dependence recorded a mean of 3.58, Productive Struggle 3.07 and Independent Skill Development 3.71. Additionally, 62.69% either agreed or strongly agreed that they use Generative AI instead of spending additional time solving difficult tasks independently. All three constructs demonstrated satisfactory internal consistency, with Cronbach's Alpha values ranging from 0.794 to 0.875. Regression analysis revealed a significant but very weak positive relationship between Generative AI Dependence and Productive Struggle ($\beta = 0.104$, $p = 0.045$, $R^2 = 0.010$). Pearson's correlation showed a significant positive association between Productive Struggle and Independent Skill Development ($r = 0.271$, $p < 0.001$).

Conclusion:

The study concludes that Generative AI is extensively used by young adults for academic, professional and problem-solving activities. Although considerable AI-substitution behaviour was observed, the findings do not establish that Generative AI dependence reduces productive struggle. Instead, a significant but very weak positive relationship was found between the two variables. The study further establishes a significant positive association between productive struggle and independent skill development. This indicates the value of continued engagement with challenging tasks, independent attempts and persistence in developing independent skills. Therefore, Generative AI can be viewed as a supportive tool rather than an automatic substitute for individual effort. A balanced approach involving independent attempts followed by purposeful

Limitations of the study

The study is limited to 394 respondents from Mumbai City and uses purposive sampling; therefore, the findings may not be generalisable to the wider population. The study relies on self-reported responses, which may differ from actual behaviour. Its cross-sectional design allows relationships to be examined but does not establish causality. Independent skill development was measured through respondents' perceptions rather than objective performance. Other factors such as motivation, prior knowledge, learning environment and digital literacy were not examined.

Acknowledgement

The authors would like to express their sincere gratitude to all those who contributed directly or indirectly to the successful completion of this research study titled “The Vanishing Struggle: Examining the Impact of Generative AI Dependence on Productive Struggle and

Abstract:

The Indus Valley Civilization, also known as the Harappan Civilization, was one of the earliest urban civilizations in the world, flourishing primarily between 2600 and 1900 BCE. It is an example of well-organized urban settlements that practiced concepts of sustainable development similar to modern times. The architecture and organization of settlements in the Indus Valley Civilization show evidence of living in harmony with the environment. The urban centres of this civilization showcased advanced systems for water management, drainage, sanitation, agricultural practices, and trade planning. The people of the Indus Valley Civilization consciously implemented sustainable practices. Major settlements like Harappa, Mohenjo-daro Dholavira , and Lothal are examples of planned streets, residential areas, public buildings, drainage systems, wells, and water storage facilities. The paper examines about the uniformity observed during constructional techniques. Lothal was planned settlement with trade and maritime. Dholavira provides evidence of water reservoirs. Indus valley civilization was closely planned with environmental and social needs of people. Water management was the backbone of this civilization. The people of Harappa practiced Sustainable agriculture. Thus, the study of ancient civilization gives the challenge and understanding of planning practices for contemporary urban development.

Keywords : *Indus valley Civilization , Harappa, Town planning, Ancient Civilization , Environment sustainability , Urban planning , Urban Development*

Introduction :

The development of Indus valley civilization was one of the major transitions in human history. This ancient urban civilization occupies distinctive position due to the fact of its highly organized settlement. Archaeological excavation at this civilization have demonstrated the existence of cities with remarkable order of grid- pattern streets, standardized bricks construction. The study of Indus valley civilization followed the planned growth. Expansion and development of this settlement created the need for an organized system of planning and governance. The urban centres of this civilization including Mohenjo-daro, Harappa , Dholavira, Rakhigarhi, Lothal, Kalibangan display remarkable heterogeneity of common planning tradition. Town planning also reflect societal framework of this civilization. The study of ancient town planning reaches beyond just understanding the past. Houses constructed using bricks, covered drains, attention to durability and maintenance, reduction of accumulation of waste water through bathing and household purpose were marked with sustainable development during that period. The drainage and sanitation system of this ancient urban civilization are particularly noteworthy.

Objectives :

1.To examine the sustainable practices during Indus valley civilization.
2. To understand the role of town planning in developing Indus valley as urban civilization.
3.To analyze the growth and progress of Indus valley civilization with modern principles.
4.To study the relationship between urban development and environmental adaptation.

Research Methodology :

The present research is based on analytical, descriptive, qualitative and quantitative method of research. The secondary data is used to examine the sustainable development during Indus valley civilization. Data was compiled from various books and journal articles. archaeological reports and excavation reports were referred for my research. Documented archaeological findings and scholarly analyses are systematically collected, studied and compared to achieve the objectives.

Literature Review :

The Indus Civilization (1968) – by Mortimer wheeler

Sir Mortimer Wheeler viewed Indus civilization as highly organized development. He highlighted features of planned streets, citadels, fortification, standardized construction wheelers work drew attention towards urban layout and developed infrastructure. His books gives a interpretation of ancient urban civilization with organized and standardized work of sustainability towards social and environment culture.

The Ancient Indus : Urbanism, Economy and Society – Rita P.Wright's – published by

Cambridge university press in 2010

This provides a extensive study of Harappan civilization through archaeology, economy, urbanism, environmental evidence. Wright's mainly focuses on relationship between rural communities and urban centres. Wright's highly emphasizes on physical town planning with social and economic development.

The Indus Civilization : A Contemporary Perspective (2002) – by Gregory L.

Possehl

This books covers origin , development and transformation, he linked Indus valleydevelopment with technology advancement. He discussed transforming nature of Indus civilization. Possehl provides multi-disciplinary interpretation of ancient urban civilization, his work is useful to study urbanism, technology, and social development. The Rise and Fall of the Indus valley civilization provides a wide range study of advancement and transformation of this civilization. She exhibit that growth and transformation of settlements were connected with trade , society , development, social, economic and cultural influence.

Ancient Urbanization and Town Planning

The advanced planning of Indus valley civilization showcase several principles that are related to Contemporary sustainable development. Even though, the Indus valley people didn't had modern approach towards sustainability but their communities showed practical approach towards land use , water use, environmental adaptation which made them progressive with effective development.

1. Planned Streets : The Harappan civilization had relatively regular pattern of streets and lanes. It has systematic network of principal streets and structured lanes. Main streets had broader routes and was connected with many important areas. Secondary Streets were connected with major neighbourhood area. And narrow lanes provided access to individual houses. The buildings and houses had entrances directly towards lanes and streets. This reflects planning of urban structures. Harappan civilization had such a significant planning that every streets had integrated drainage system. Road infrastructure was planned in such a way that transportation and drainage system was planned together. Every street lanes managed household wastes. Stones were used to build roads in Dholavira. Some streets in Harappan civilization were brick paving. Harappan civilization streets were build with local resources and materials. The streets completely reflects on the environmental and geological condition and adaptation. Compacted earth, bricks, mud were also used in various settlements. Earthen materials was used for surfacing and filling of roads and streets.
2. Drainage System : Every particular houses in Harappan civilization had its own drainage system connected to main streets. Instead of waste flowing randomly from streets it was directed into chambers. Street planning and sanitation were interconnected. Some drainage chambers had removeable covers to easily lift it for cleaning whenever necessary. Bathing platforms were designed with sloping floors that the water could directly flow in drain. This demonstrates how water disposal or waste disposal were managed during that period. The drainage system helped in contributing cleaner streets. It also helped maintaining better household hygiene. Harappan civilization had more of organized drainage system and planning compared to contemporary. Bricks were majorly used for construction of drain. The drainage system here had a hierarchical

Structure water waste from individual houses were moved to smaller drains on lanes and then to larger street drains. The covered drains helped streets and

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

area protected from diseases, and created a safe environment with hygiene.

3. Houses : Houses of Indus valley civilization was well planned and organized. They were example of comfort, sanitation, privacy and cleaniness. The houses were mostly two or more storeys. Although they vary in size, they were all of similar plan. Every single house had courtyard. Every houses had its own square courtyard. Rooms were interconnected to courtyard directly. Ground floor of the houses were mostly used as store rooms, well chambers and bath. Houses usually had flat roofs, which was used as living and working space. Most of houses had multiple rooms which had kitchen, storage rooms, bedrooms, bathroom etc. Doors were made up of wood. Nearly all the houses had interior opening window. Stairways were made up of solid masonary. Every house had a separate bathroom which was directly connected to the drain. The average size of ground floor was about 30 feet square, but size may vary in terms of occupation , position and area of houses.

Large and Medium scale indicated the existence of weathly and upper middle class category. The courtyard were build up in such a manner that it provided proper light and ventilation. Most of houses had its own private well beside their houses. Every lane had public well.Typically very rare houses had windows with outer walls.

4. Construction Resources : Bricks were commonly used at every site. Both baked and unbaked bricks were used for construction purpose. The people of Mohenjo-daro mostly used burned bricks whereas mud bricks were used for fillings and mass work. Nearly all the domestic architecture at Kalibangan , reserved burned brick for bathrooms and wells. Stones were rarely used to build structures. Timber was also used occasionally. The bricks were rectangular in shape, well made and also well preserved. Timber was mostly used for flat roofs. Rather than depleting distant resources, people of Indus valley civilization used abundant local resources.
5. Mohenjodaro : Mohenjodaro lie near the bank of Indus in Larkana district of Sindh. The main layout of this city was the management of land use and resources. The citadel was to the west of city whereas lower city with lanes and street was towards east. The most captivating building in this city was the Great Bath. It is a rectangular tank surrounded by rooms and corridors. There were steps at both the end that allowed people to enter and leave tank. Drainage system was carefully designed here to remove water. The pool was build with baked bricks. The architecture,

water management,, drainage system, water proofing techniques, public construction were the finest example that how Indus valley were civilized and developed with the techniques of modernity.

6. Great Granary System : Excavation revealed that a great platform of mud brick with about 20 feet of thickness was found in Harappa. The most of great granary evidence were discovered in citadel. Granary were build up on raised high platforms. The granary system was organized in such a way that it protected stored goods from dampness. Ventilation played a major role to allow air circulation to keep food and grains dry. Storage structure helped them to organize , collect and distribute it collectively.
7. Grid Pattern : Grid pattern was a systematic layout during town planning. Streets and lanes were

regular and in planned pattern. Every street and roads were intersected to each other in right angle form. The city was divided into square and rectangular blocks. Thus this grid pattern made drainage, construction, administration movements easier.

Conclusion :

The Indus valley civilization shows a strong understanding of well planned cities. It shows that sustainable planning is not an modern idea, but a principle which was practiced before thousand of years with efficient management. The harappan civilization provides valuable lesson about a balance of human needs with efficient natural resources. The town planning was one the biggest example of sustainable urban development. Indus valley civilization had practical approach towards water conservation, sanitation, public health , systematic planning. The harappan people approach towards the efficient and sustainable life was well organized. The planning of this civilization provides a valuable lesson for modern sustainability. The Indus valley people showed the importance of water management and waste management effectively. They gave approach towards maintaining clean and healthy living environment. The thoughtful planning of these people reduce environmental issues and gave a better living to them. The ancient societies developed practical knowledge for sustainable development. The planned cities like Dholavira , Harappa , Mohenjo-daro were the finest example of development and progress. Looking over all of standardize development of architecture , drainage

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

system, water management , evaluation of resources it proves that people of Harappa were highly skilled. Houses and public buildings were example of advanced architectural skills. The archaeological remains provided valuable information about the civilized life they lived. The civilization also had proper trade network. The civilization reflects adaptation to local environmental conditions. They had standardize knowledge regarding measurements and uniformity. The Indus valley civilization had dedicated social equity. Harappan civilization proves that sustainable development is deeply rooted with human ingenuity. Those ancient practices by them offer practical solution for contemporary urban and environmental challenges.

Abstract

Paithani is simultaneously a heritage textile, a livelihood system and a differentiated market product. This paper develops a new analytical framework for understanding the contemporary Paithani handloom economy in Maharashtra by connecting four dimensions that are often examined separately: cluster structure, production economics, market access and authenticity. The analysis is based on the supplied study of the Yeola and Paithan clusters and reorganizes its evidence into a business-oriented interpretation rather than reproducing its original structure. The source describes more than 12,000 active handloom weavers and auxiliary workers, annual production above 85,000 authentic handloom sarees, and a strong concentration of commercial activity in Yeola. It also identifies substantial differences between the cost of authentic handwoven products and powerloom imitations. The paper argues that the central economic problem is not simply competition from cheaper substitutes; it is the difficulty of converting craftsmanship, time and authenticity into a price that is transparent and understandable to consumers. GI protection, digital direct-to-consumer channels, traceability, raw-material support and design innovation therefore need to operate as a connected strategy. The paper concludes with a practical framework for strengthening artisan bargaining power while protecting the identity of Paithani.

Keywords: *Paithani; handloom economy; Yeola; Paithan; artisan livelihoods; GI; digital commerce; textile clusters; authenticity; Maharashtra*

Introduction

Traditional handloom industries survive through a combination of inherited skills, local production networks and the ability to obtain a sustainable market price. Paithani illustrates this relationship particularly clearly. The supplied study traces the tradition to Paithan and describes its later expansion in Yeola, where commercial production developed into a major cluster. The textile is distinguished by handloom weaving, interlocking tapestry principles, mulberry silk and zari, together with recognizable motifs and a strong association with Maharashtrian cultural identity. The contemporary Paithani business environment, however, differs sharply from the historical environment in which the craft developed. Consumers can now compare products instantly, low-cost imitations can enter the market at scale, and artisans can potentially bypass traditional intermediaries through digital channels. These changes create both pressure and opportunity. The same digital infrastructure that makes imitation easier can also allow an authentic weaver to explain the origin, materials, production time and identity of a saree directly to a buyer. This paper therefore asks a central question: how can the Paithani handloom cluster convert cultural value and craftsmanship into stronger economic value for producers? Rather than treating history, production costs, competition and e-commerce as separate topics, the paper links them into a single business system.

Objectives of the Study

- To reinterpret the economic structure of the Paithani handloom sector through a cluster-based business framework.
- To compare the economic characteristics of the Yeola and Paithan clusters using the evidence supplied in the source study.

To examine how production time, raw materials and labour affect the value proposition of an authentic Paithani.

- To assess the business significance of powerloom imitation and intermediary dependence.
- To develop a practical strategy linking GI protection, digital selling, traceability and design innovation.

Scope and Methodology

The paper uses a descriptive and analytical secondary-data approach. Its empirical base is the supplied five-page study on the economic dynamics, cluster statistics and market evolution of the Paithani textile industry in Maharashtra. The present paper does not claim to have conducted a new field survey, laboratory test or independent census. Figures are therefore treated as reported estimates from the supplied material, not as independently verified primary observations. The analytical procedure has three stages. First, the source evidence is reorganized around the business chain: inputs, production, labour, distribution, consumer value and competitive pressure. Second, the two principal clusters are compared to identify differences in scale and market orientation. Third, the reported findings on GI protection and digital channels are interpreted as mechanisms for improving value capture. Where the source does not provide evidence, the paper avoids assigning a numerical estimate.

A limitation of the method is that the supplied material contains estimates from different sources and years and does not provide a full micro-level sample of individual weavers. Consequently, the paper is best read as a conceptual and descriptive research contribution rather than a causal econometric study.

Paithani as a Cluster Economy

The Paithani industry is better understood as a cluster economy than as a collection of isolated household enterprises. Weaving is supported by activities such as yarn preparation, winding, dyeing, warp setting, zari-related work, trading, retailing and increasingly digital marketing. This network creates local economic spillovers because income generated by the saree is distributed across several stages of production and distribution. The source reports more than 12,000 active handloom weavers and auxiliary workers and annual output above 85,000 authentic handloom sarees. It also identifies Yeola as the commercially dominant cluster, while Paithan retains a stronger heritage, training and boutique orientation. The distinction is important: a cluster can preserve cultural significance without having the same commercial scale as another cluster.

Indicator	Yeola cluster	Paithan cluster	Business interpretation
Active handloom units/looms	8,500–10,000 active looms	400–600 active looms	Yeola has substantially greater production scale.
Estimated annual turnover	₹400–500 crore	₹35–50 crore	Commercial concentration is stronger in Yeola.
Main specialization	Commercial bridal sarees and designer weaves	Heritage pieces and training-oriented activity	The clusters serve partly different market positions.
Distribution	Showrooms, exports, e-commerce	Exhibitions, boutique orders, government depots	Yeola shows broader market-channel diversification.

Source: Reorganized from the supplied study's cluster comparison. The figures are reported estimates in that source.

Production Economics: Why Time Matters

A distinctive feature of Paithani economics is the large role of skilled labour and production time. The supplied study reports production periods ranging from about one month for a standard traditional border design to more than twelve months for highly intricate master weaves. This means that the economic value of a saree cannot be understood only through the material cost of silk and zari. For a standard handloom Paithani with a reported retail value of ₹40,000, the supplied study places raw silk at approximately 30–35 percent, zari at 20–25 percent, weaver labour at 30–35 percent, and dyeing, finishing and profit at 10–15 percent. These ranges indicate that labour is not a marginal component. Skilled human time is one of the principal economic inputs.

Cost component	Reported share	Illustrative amount	Economic meaning
Mulberry silk yarn	30–35%	₹12,000–14,000	Exposure to yarn-price

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

			movement.
Metallic zari	20–25%	₹8,000–10,000	Exposure to precious-metal and quality variation.
Weaver labour	30–35%	₹12,000–14,000	Direct expression of skill and production time.
Dyeing, finishing and profit	10–15%	₹4,000–6,000	Covers finishing activities and commercial margin.

The ranges above should not be interpreted as a precise accounting statement for every saree. They describe the standard example presented in the supplied study. Actual economics will vary with design complexity, material quality, production duration and selling channel.

The Market Problem: Authenticity versus Price

The most important competitive issue is the gap between the economics of authentic handloom production and the price of imitations. The supplied study reports that handloom sarees may require weeks of work, whereas powerloom imitations can be produced in a few hours and sold at much lower prices. This creates a communication problem as well as a production problem: a consumer who sees two visually similar products may not immediately recognize the difference in process, material, durability, labour and cultural value.

The consequence is market cannibalization. When low-cost imitations are presented as Paithani without clear differentiation, the premium attached to genuine handloom production becomes harder to defend. The burden is therefore on the authentic segment to make invisible attributes visible.

A useful business principle follows: authenticity must be converted from an abstract claim into verifiable product information. A buyer should be able to understand who made the saree, where it was woven, what materials were used, how long it took, and what certification supports the claim.

Intermediaries and Weaver Bargaining Power

The source identifies intermediary dependence as a major structural weakness. It reports that more than 65 percent of weavers lack direct market access and may operate through a financing arrangement in which traders supply yarn and zari and compensate weavers through piece-rate wages. The reported wage range of less than ₹300–400 per day illustrates the potential gap between the final retail value of a saree and the income captured by the artisan. This is fundamentally a value-capture issue. Intermediaries can perform useful functions—finance, material procurement, quality aggregation, inventory holding, transport and retail access—but dependence becomes problematic when artisans have little ability to compare buyers or negotiate prices. Digital channels create an opportunity to change this balance, but online selling also requires photography, cataloguing, customer communication, packaging, payments, logistics and after-sales service. Digital access alone therefore does not guarantee higher income.

GI Protection as a Market Instrument

The supplied study identifies Paithani Sarees and Fabrics with GI Registration No. 3 and interprets GI protection as a legal and market mechanism for distinguishing authentic products. In business terms, the value of GI is strongest when the certification is connected to consumer-facing verification. A GI label by itself may not be sufficient for a buyer who cannot distinguish a genuine product at the point of purchase. A stronger model would connect certification with traceability. The proposed system can include a unique product code, artisan or unit identification, production information and material-related documentation where available. Such a system would not replace formal GI enforcement; it would translate the idea of authenticity into a usable retail experience.

Digital Transformation and Direct-to-Consumer Selling

The source reports increased use of Instagram, WhatsApp Business catalogues and e-commerce platforms after 2020, with direct selling reducing intermediary margins and improving reported weaver earnings. The strategic importance of these channels is larger than simple online advertising. D2C selling changes the information relationship between producer and consumer. In a traditional transaction, the buyer may see only the finished saree. In a digital transaction, the seller can show the loom, weaving stages, motifs, production duration and artisan story. This additional information can support a premium position because it explains why an authentic Paithani costs more than an imitation. However, the transition to D2C should be treated as a capability-building project. Cluster-level support can provide common photography facilities, standardized product

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

descriptions, packaging guidance, digital payment training, customer-service templates and shared logistics. Such services would reduce the burden on individual artisans while preserving direct producer identity.

A New Strategic Framework for the Paithani Cluster

The evidence supports a five-part strategy in which each intervention reinforces the others:

- Authenticity layer: strengthen GI awareness and create easy-to-understand verification at the point of sale.
- Traceability layer: connect a product code with artisan/unit information and basic production details.
- Market-access layer: develop D2C channels and curated digital storefronts for domestic and diaspora buyers.
- Capability layer: provide training in digital marketing, product photography, pricing, packaging and customer communication.
- Design-and-product layer: develop contemporary applications of Paithani motifs while protecting the core identity of the traditional weave.

The framework changes the policy question from 'How can handloom compete with cheaper powerloom?' to 'How can authentic handloom create a market category whose value cannot be reduced to appearance alone?' This is a more sustainable competitive position because it competes on provenance, craftsmanship, identity and trust.

Discussion

The Paithani case demonstrates a broader principle of heritage-industry economics: cultural uniqueness becomes economically useful only when institutions and markets can recognize and reward it. Production skill creates potential value, but market access determines how much of that value reaches the producer. The comparison of Yeola and Paithan suggests that different cluster roles can coexist. A large commercial cluster can specialize in scalable premium products and diversified distribution, while a smaller heritage cluster can concentrate on training, high-value pieces, cultural interpretation and specialized orders. Public policy need not force both clusters into an identical business model.

The evidence also suggests that digital transformation should not be evaluated merely by counting social-media accounts or online listings. A more meaningful indicator is whether digital selling changes producer bargaining power, customer reach, price transparency and repeat demand. Future studies should therefore measure these outcomes at artisan level.

Policy and Business Recommendations

- Create cluster-level yarn and zari support mechanisms to reduce vulnerability to raw-material price volatility.
- Develop a standardized authenticity card or digital product record linked to GI-related information.
- Build shared D2C infrastructure so artisans can access photography, catalogue management, payments and logistics without surrendering product identity.
- Introduce transparent price calculators that explain material, labour and design components to consumers.
- Establish design-development programmes that adapt motifs for contemporary products without erasing traditional weaving principles.
- Conduct periodic artisan surveys to measure income, working days, intermediary dependence, digital sales and youth participation.
- Promote consumer education that clearly explains the difference between handwoven Paithani and visually similar machine-made products.

Future Research Agenda

The supplied study provides a strong descriptive foundation, but several questions require primary research. A future field survey should collect household-level information from weavers in Yeola and Paithan, including hours per saree, actual material expenditure, piece-rate income, selling price, access to credit and the share of direct versus intermediary sales. A consumer experiment could then test whether QR-based provenance information increases willingness to pay for authentic Paithani. A longitudinal study could examine whether digital selling produces durable income gains or merely shifts marketing work from traders to artisans.

These research directions would allow the sector to move from descriptive cluster statistics toward evidence-based measurement of productivity, welfare and market performance.

Conclusion

Paithani should be viewed not only as a traditional textile but as a specialized rural industry whose competitive advantage lies in skill, time, provenance and cultural meaning. The supplied evidence shows a commercially strong Yeola cluster, a smaller heritage-oriented Paithan cluster, significant labour and material costs, strong competitive pressure from powerloom imitations,

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

and emerging opportunities through direct digital channels.

The central strategic challenge is value capture. If consumers cannot distinguish authentic handloom from imitation, the market rewards low production cost rather than high craftsmanship. GI protection, traceability, direct selling, raw-material support and design innovation can collectively address this problem. The long-term objective should therefore be to build a transparent premium market in which the economic reward for authenticity reaches the artisan who creates it.

Acknowledgement

I express my sincere gratitude to all those who contributed to the successful completion of this research paper, "Rethinking the Paithani Handloom Economy in Maharashtra." I am thankful for the valuable sources, studies, reports, and institutional information that provided the foundation for understanding the economic, social, and cultural dimensions of the Paithani handloom industry.

Financial support and sponsorship

Abstract

In a developing country like India, mental health is now being recognized as an integral part of health, human development, social well-being, and national productivity. To achieve the goal of becoming a developed nation by 2047, it is essential for India to focus not only on economic and technological progress but also to pay serious attention to the mental health of its people. This conceptual research paper presents a detailed review of the current state of mental health in India and proposes a nationwide strategic and innovative approach for 'Mental Health and Well-being 2047' within the overarching framework of 'Viksit Bharat@2047'. This paper presents a comprehensive review not only of the current conceptual foundations of mental health and well-being in India but also of the evolution of mental health policy, existing challenges, emerging needs, and the roles played by children, adolescents, higher education institutions, workplaces, communities, digital services, and research. In this study, we have adopted a clear conceptual and policy-review methodology, drawing upon government documents, national mental health reports, legislation, and international policy frameworks. This research paper proposes ten strategic pillars for mental health development at the national level, encompassing key areas such as the prevention of mental health problems, early intervention, community care, suicide prevention, digital mental health, educational and workplace well-being, workforce development, research and innovation, social inclusion, and governance. Additionally, the paper outlines a phased national implementation strategy covering the periods 2026–2030, 2031–2040, and 2041–2047. In essence, this research paper concludes that mental health and human well-being should be regarded as central components of human capital and sustainable development. To transform India into a developed nation by 2047, we will require—at both national and local levels—integrated services, sustainable financing, a capable workforce, responsible technology, community participation, evidence-based policy, and a strong commitment to equity and human rights to ensure a mentally healthy India.

Introduction

Mental health implies more than just the absence of mental illness; it encompasses well-being and behaviours deeply linked to functional capacity, relationships, productivity, resilience in the face of adversity, and the ability to participate meaningfully in society.

Quick Response Code:

Website: https://bnir.us

The World Health Organization (WHO) regards mental health as a critical and integral component of overall health, emphasizing promotion, prevention, treatment, rehabilitation, and community-based care.India has also made significant progress in mental health care through various initiatives such as the 'National Mental Health Programme', 'National Mental Health Policy 2014', 'Mental Healthcare Act 2017', 'District Mental Health Programme', and 'Tele-MANAS'. The 'Mental Healthcare Act' established a national legal framework based on mental health rights, while various national mental health programmes have made unprecedented efforts to expand advanced mental health services within the health system. Despite all these efforts, significant challenges regarding mental health persist in India. The 'National Mental Health Survey,'conducted across 12 states between 2015 and 2016, revealed substantial needs related to mental health services and a wide gap between the demand for services and their actual utilization, highlighting a lack of adequate mental health care. The survey also identified local-level barriers related to awareness, social stigma, service availability, cost, distance, and insufficient resources. India's 2047 Development Vision offers a perfect opportunity to re-establish mental health as a central component of human development, within the context of development. Economic growth alone cannot be considered complete development without mental health. Therefore, for the national vision of 2047, the Government of India should move beyond the treatment of mental disorders and shift towards promoting mental health at the local level, preventing mental health problems, building resilience to life's challenges, early intervention, recovery, social inclusion, and lifelong well-being.

The Concept of Mental Health and Wellness:

Mental health can be understood as a multidimensional state of an individual, primarily encompassing emotional understanding, psychological thought processes, social support, and functional productivity. In a general sense, mental health relates to how an individual—in the context of reality—thinks, feels, forms relationships, makes decisions, faces challenges, and engages in the activities of daily life regarding themselves and others. Mental health and wellness hold broad significance in our lives, placing greater emphasis on positive functioning rather than merely the absence of psychological problems. Key components include:

1. Emotional balance.
2. Resilience (the ability to bounce back from adversity).
3. Positive relationships.
4. Self-awareness.
5. Meaning and purpose.
6. Adaptive coping (effective ways of facing challenges).
7. Social connection.
8. Productive functioning.

Based on the various arguments regarding mental health discussed above, we can conclude that—keeping the vision of a 'Developed India 2047' in mind—we need to shift our mindset on this issue. A positive perspective on mental health must be fostered at the national level. The flowchart below illustrates this positive approach to mental health.

Mental health → Mental wellness → Prevention → Early intervention → Treatment → Recovery → Social inclusion

Mental Health in the Indian Context:

In India—a developing nation—the mental health status of citizens is influenced by numerous factors, such as the population's diversity regarding caste, religion, and region; rapid urbanization; changing family structures; pressures related to education and work; socio-economic inequality; substance abuse; digital transformation; migration; unemployment; illiteracy; a lack of public amenities; corruption; adulteration; the indiscriminate exploitation of natural resources; and various social and psychological factors linked to health. The objective of the National Mental Health Survey, being conducted extensively in India, has generally been to assess the prevalence of mental health problems, the treatment gap, the utilization of health services, disability, the shortage of trained service providers, socio-

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

economic impacts, and the availability of mental health resources. Surveys conducted in recent years have revealed a treatment gap of approximately 83% for mental health problems, highlighting the significant disparity between the need for care and access to evidence-based treatment. Thus, the aforementioned results indicate that India's mental health care strategy cannot rely solely on specialized hospitals. Moving forward, we need to work continuously on a comprehensive approach that integrates primary care, community services, specialized care, rehabilitation, digital services, family support, and prevention-focused programs to achieve significant progress in mental health care.

Evolution of Mental Health Policy in India:

Over the past few decades, the focus of mental health-related activities in India has rapidly shifted away from diverse social and institutional treatment approaches towards community care and services based on mental health rights. Key developments regarding mental health have driven this transformation. Some of the significant developments include the following:

A. National Mental Health Programme (1982) – India adopted a public health approach to mental health care in 1982.

B. District Mental Health Programme – With the support of the Central Government, state governments rapidly expanded mental health services at the district level, based on community-oriented standards.

C. National Mental Health Policy (2014) – By implementing the National Mental Health Policy (2014), the Government of India provided a policy framework emphasizing equity, rights, promotion, prevention, accessible care, and social inclusion.

D. Mental Healthcare Act (2017) – The Government of India further strengthened legal protections regarding mental health under the Mental Healthcare Act (2017) and recognized the rights of persons suffering from mental illness.

E. National Tele Mental Health Programme/Tele-MANAS – This initiative by the Government of India has made access to mental health support easier and more accessible for Indian citizens. It is now essential to expand the role of digital technology to further enhance this service. The objective of Tele-MANAS is to make mental health services easily accessible to those in need. The services provided through Tele-MANAS—delivered digitally—offer a form of direct, face-to-face interaction between individuals in need and trained mental health professionals, addressing a critical need of the times.

The contact numbers for the Government of India's Tele-MANAS (National Tele Mental Health Programme) are:

A. 14416 — Toll-free, 24×7 mental health helpline.

B. 1800-89-14416 — Alternative toll-free number.

This specialized digital service is available to citizens from any corner of the country at any time, connecting them with expert mental health counselling, clinical support, and—if needed—further mental health services. While the implementation of various policies and their subsequent evolution are satisfactory, the actual outcomes remain far from satisfactory. Even today, access to these services lies well beyond the reach—and often the awareness—of the common person. Individuals frequently hesitate to seek expert advice when facing mental health issues. This diminishes the effectiveness of these schemes. There is a need to foster a positive mindset regarding mental health through digital and other channels—an area where work remains to be done—and this provides a crucial foundation for the proposed 2047 framework.

Current Challenges and Emerging Mental-Health Needs: Key challenges regarding mental health care in India include the following factors:

A. Shortage and inequitable distribution of trained professionals in institutions.

B. Significant rural-urban disparity.

C. Stigma and a lack of awareness about mental health among citizens.

D. Social and economic barriers.

E. Limited availability of community-based services in remote and inaccessible areas.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

F. Inadequate engagement of citizens with primary healthcare.
G. Stress associated with academic and work pressures.
H. Rising risk of suicide among citizens.
I. Ever-increasing problems related to substance abuse.
J. Inequality in digital accessibility.
K. Lack of coordination between government/non-government departments and citizens.
L. Limited opportunities for social reintegration of victims following rehabilitation.
M. Discrepancy between institutional research and ground realities.

Mental health needs are evolving day by day alongside the continuous advancement of technology, changing and shrinking employment opportunities, the growing stress of loneliness, weather- and disaster-related anxieties, migration, and the increasing use of the digital world. Therefore, we must shape India's 2047 strategy for mental health protection in a way that is sufficiently flexible, grounded in scientific evidence, aligned with cultural norms, and consistently capable of addressing emerging mental health threats in every respect.

Research Gap

While India is continuously developing various significant policies and programs related to mental health, there remains a need for an integrated and long-term mental health protection framework—one that addresses these issues and bridges the gap between citizens and mental health services.

Mental Health + Wellness + Prevention + Education + Employment + Community + Digital Technology + Research + National Development

Existing mental health promotion programs in India focus only on specific populations or particular segments of service delivery. A comprehensive framework for 'Mental Health and Wellness 2047' could provide a broad perspective for developing mental health promotion programs—one that sustainably aligns with India's long-term goals of achieving holistic human capital and social development by fostering mental well-being.

Objectives of the Study: This paper has three main objectives:

1.To review the current state of mental health in India, policy developments, challenges, and emerging mental health needs.
2.To develop a conceptual strategic framework for 'Mental Health and Wellness 2047'.
3.To propose implementation strategies and policy recommendations for creating an equitable, prevention-focused, community-based, and wellness-oriented mental health system by 2047.

Research-related questions:

1.What key mental health challenges will India face as it moves towards 2047?
2.On which strategic pillars should the 'National Mental Health and Wellness 2047' framework be based?
3.Which policies and implementation strategies can facilitate equitable and sustainable mental health development in India?

Methodology: Conceptual and Policy Review

This research paper is based entirely on a methodology involving a conceptual and policy review. It examines secondary data obtained from official policy documents of the Government of India and the World Health Organization (WHO), national mental health reports, legislation, the WHO framework, and literature from various scholars. The National Mental Health Survey recently conducted by the Government of India is particularly significant for this research paper, as it comprehensively examined the status (prevalence) of mental health, treatment gaps, service utilization, disability, socio-economic impact, and mental health systems across 12 Indian states—issues that warrant serious consideration. The analysis presented here is organized around these themes to provide greater clarity to the study.

A. Mental health policy.
B. Population needs.
C. Prevention and promotion.
D. Community mental health.
E. Children and adolescents.
F. Suicide prevention.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

G. Digital mental health.
H. Higher education.
I. Workplace health and well-being.
J. Workforce development.
K. Research and innovation.
L. Governance and implementation.

No primary data was collected for this study. Therefore, the model proposed in the study should be regarded as a conceptual and policy framework that requires empirical evaluation in the future.

Mental Health and the Vision of Viksit Bharat@2047:

The concept of Viksit Bharat@2047 presents a framework for India's long-term development. From the perspective of Viksit Bharat@2047, mental health must be considered an integral part of human capital. A healthy citizenry is crucial for a healthy economy:

Healthy Individuals → Healthy Families → Healthy Communities → Productive Workforce → Strong Human Capital → Sustainable Development

Thus, it is evident that mental health should not be regarded merely as a minor issue linked to citizens' healthcare. Instead, it must be fully integrated into areas such as citizens' access to education, employment, social security, public health, technology, and community development.

Proposed Vision and Mission2047:

Vision: "To transform India by 2047 into a nation where every citizen is mentally healthy, psychologically resilient, inclusive, and socially supportive. Every individual in India should have equal opportunities for mental health promotion, prevention, early treatment, quality care, recovery support, and meaningful participation in society."

Mission: Our mission is to develop an integrated national mental health ecosystem based on the following principles:

Prevention + Promotion + Accessibility + Equity + Community + Technology + Workforce + Research + Recovery + Inclusion

Ten Strategic Pillars of Mental Health 2047

Pillar 1: Mental Health Promotion and Prevention: Promoting emotional understanding, resilience, healthy lifestyles, coping skills, and mental well-being among citizens throughout their lives.

Pillar 2: Early Identification and Intervention: Establishing advanced systems to identify mental health issues across all urban and rural schools, colleges, workplaces, primary health centres, and communities.

Pillar 3: Community-based Mental Health Services: Strengthening community and primary health care systems across India and linking them with district and specialist services.

Pillar 4: Child and Adolescent Mental Health: Prioritizing and mandating mental health programs, counselling, life skills education, parental awareness, bullying prevention, and early intervention in government and non-government schools.

Pillar 5: Suicide Prevention: Developing integrated and robust systems for addressing the causes of suicide among citizens, crisis response, referrals, follow-up, and responsible communication.

Pillar 6: Digital Mental Health: Strengthening the existing Tele-MANAS digital mental health support system and developing an integrated digital-physical system for mental health.

Pillar 7: Well-being in Higher Education and Workplaces: Making all higher education institutions—such as universities and colleges—and workplaces in India mentally healthy.

Pillar 8: Development of the Mental Health Workforce: Expanding multidisciplinary training programmes, improving broad geographical distribution, and developing and strengthening training institutions for mental health professionals.

Pillar 9: Research, Innovation, and Data: Developing evidence tailored to the Indian context—incorporating ancient Indian knowledge traditions—as well as culturally appropriate assessment tools, implementation research, digital innovations, and reliable mental health information systems.

Pillar 10: Equality, Recovery, and Social Inclusion: Ensuring that mental health services equally safeguard the dignity, autonomy, rights, rehabilitation, employment,

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

education, and social participation of all citizens.

Implementation Strategy:

Successfully realizing the 'Mental Health 2047' vision for mental health in India requires a systematic, phased, and long-term implementation strategy at the national level. Meaningful changes in the effectiveness of mental health care programs cannot be achieved through short-term initiatives alone. This is because it still requires systematic changes across government and non-government administration, healthcare delivery, human resources, digital infrastructure, education, research, social attitudes, and community participation. With this in mind, a mental health implementation strategy has been proposed in three key phases: 'Mental Health 2047' Phase I (2026–2030), 'Mental Health 2047' Phase II (2031–2040), and 'Mental Health 2047' Phase III (2041–2047). Each of these phases has its own specific priorities and requirements; since the subsequent phase builds upon the achievements of the preceding one, comprehensive progress across all phases is essential.

First Phase : 2026–2030 — Laying the Foundation for Mental Health Facilities

The first phase of upgrading mental health facilities should focus on establishing a robust foundation for the development of mental health care in India. Governance mechanisms and staff training associated with mental health programs need to be enhanced; simultaneously, given the steadily rising demand for mental health care, mental health services across the country should be integrated with primary health care services. Tele-MANAS and other digital services should be expanded to increase outreach. Mental health data should be enhanced to facilitate evidence-based planning for upgrading mental health facilities, and mental health surveillance systems should be established. Mental health programs should be launched at school and university levels to promote the early identification and prevention of mental health issues. To prevent suicides in the absence of adequate mental health services, efforts will be strengthened to build necessary infrastructure, raise community-level awareness, and implement programs that eliminate the stigma surrounding mental health. Future initiatives will also focus on enhancing research capabilities, psychological support, psychological first aid, and crisis response mechanisms, as well as improving coordination between the mental health, education, and social sectors.

Second Phase: 2031–2040 — Expansion and Integration

The second phase will focus on expanding mental health services across the country's diverse communities and regions and integrating them seamlessly. Community-based mental health networks will be strengthened across all regions of India, with a particular emphasis on establishing an extensive mental health enhancement network at the district and rural levels. Digital and physical mental health services will be integrated to ensure continuous and easily accessible care, thereby facilitating the adequate development of mental health facilities. Service providers will be selected to implement workplace wellness programs aimed at addressing stress, burnout (excessive work pressure), and issues related to psychological well-being. From a rehabilitation perspective, psychosocial rehabilitation and recovery-oriented services will be expanded nationwide to assist every citizen grappling with mental health issues in reintegrating into society—both socially and vocationally. Research and innovation grounded in evidence-based mental health practices will be consistently promoted and encouraged. To develop a uniform and integrated mental health system for all citizens, coordination across various sectors, family and community participation, and the training of community health workers will be strengthened in the context of mental health.

Third Phase: 2041–2047 — Strengthening and Transformation

The third phase will focus on achieving equitable and sustainable mental health care for all citizens of India by 2047. Advanced digital systems and effective technologies like Artificial Intelligence (AI)—

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

available at that time—will facilitate this. The responsible use of these technologies in the context of mental health will aid in early detection, treatment, monitoring, and prevention. Furthermore, such systems will ensure future privacy and confidentiality for both mental health service recipients and providers, while offering adequate safeguards. Priority will be given to the increasingly prevalent person-centered and recovery-oriented approaches in mental health care, with a strong emphasis on social inclusion and the reduction of stigma and discrimination among service users. Peer support among mental health service users and the participation of individuals with lived experience of mental health issues will be encouraged. Mental health research and innovation will be further strengthened at the international level to meet global standards in India as well. Prioritizing mental health, prevention, resilience, and the development of healthy communities—alongside enhancing the quality of life for the general urban and rural populations—will become key national priorities, helping India develop a truly comprehensive and inclusive mental health system by 2047.

Expected Outcomes:

If the 'Mental Health 2047' vision is successfully implemented based on the aforementioned framework, significant improvement in the mental health status of India's citizens is anticipated in the future. This will help address existing gaps in the treatment of mental health issues and facilitate the provision of accessible and affordable mental health services at all levels; the initiative will be particularly beneficial for communities where mental health facilities are scarce or currently out of reach. These schemes can be easily extended to those living in rural or remote areas. Placing greater emphasis on the immediate prevention and early detection of mental health issues will ensure that individuals struggling with mental health challenges receive timely and adequate support. In the future, focusing specifically on children and adolescents in need will improve their emotional well-being and foster a healthier educational environment, thereby securing India's future. Robust systems to prevent untimely suicides caused by mental health issues, along with workplace wellness programs and community-based services, will help create a safe and supportive environment while further enhancing productivity. Implementing this plan will lead to the development of a sufficient workforce of skilled and well-trained personnel, resulting in significant improvements in the quality and continuity of professional mental health care. At the societal level, awareness and anti-discrimination initiatives are expected to help reduce future discrimination against individuals facing mental health issues and facilitate their better integration into society. Improvements in mental health digital data systems and strengthened research capabilities will further bolster evidence-based policies, plans, and interventions regarding mental health. Better mental health holds significant promise for fostering human capital development, enhancing educational achievements, generating employment, boosting social and individual productivity, and improving the overall quality of life for citizens. The ultimate outcome of the 'Mental Health 2047' vision should be a gradual shift from a primarily illness-centric approach toward a comprehensive model focused on mental well-being, prevention, recovery, social inclusion, and psychological wellness—thereby imparting sustainable momentum to national development.

Challenges in Implementing the 'Mental Health 2047' Vision

Implementing the 'Mental Health 2047' vision in India could face several major challenges. A primary concern is the shortage of trained mental health professionals and their uneven distribution across rural and urban areas. Furthermore, the lack of clear government policies regarding these professionals has resulted in a persistent scarcity of newly trained personnel. Limited and unequal financial resources for mental health promotion could impact the development and long-term sustainability of mental health programs in the future. Furthermore, social stigma, discrimination, and a lack of awareness regarding mental

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

health may hinder citizens from recognizing mental health issues and seeking timely assistance. Fragmented governance and a lack of coordination across various sectors involving the central and state governments could lead to future shortcomings in the delivery of mental health services. Disparities in access to digital resources—including limited access to technology and the internet—could curtail the future benefits of tele-mental health services, particularly for marginalized communities and underdeveloped regions in India. Furthermore, as digital mental health systems expand in the future, issues such as digital data privacy, client confidentiality, and ethical concerns regarding mental health services will become increasingly critical. Given India's vast cultural and regional linguistic diversity, there is a need for services that are locally appropriate and highly effective, and that remain sensitive to diverse social contexts. Another major challenge is the wide gap between mental health research and its practical application. In India, inadequate rehabilitation facilities and social reintegration systems can hinder the long-term recovery process. Upgrading mental health services will require sustained funding, political commitment, and continuous monitoring and evaluation of large-scale programs over several decades. Therefore, India's challenge today is not merely to create more mental health services, but to establish a comprehensive, accessible, equitable, and sustainable mental health system across the country—one that enables people to timely recognize mental health issues themselves, seek adequate help from mental health professionals through informed awareness, receive appropriate care within a supportive social context, recover in a timely manner, and participate meaningfully in society, thereby contributing to social progress.

Suggestions:

Based on the conceptual review in this research paper, several concrete suggestions have been offered to achieve the goals of 'Mental Health 2047'. Foremost among these is the recommendation that mental health be immediately integrated into the national development plan and recognized as an essential component of citizens' overall health, social development, and human capital. Public investment in mental health must be consistently increased across the length and breadth of the country to ensure the availability, affordability, and continuity of mental health services. Mental health care should be rapidly integrated with primary and community health care systems to improve the early identification, treatment, referral, and follow-up of mental health issues. The mental health workforce should be strengthened through improved education, training, recruitment, and equitable geographical distribution. Trained mental health personnel should be urgently deployed, particularly in rural and underserved areas. Comprehensive and special attention must be paid to women, children, adolescents, and youth through extensive programs focused on mental health promotion, prevention, counseling, and early intervention.

Suicide prevention must be urgently developed at the national level as a coordinated multi-sectoral program involving health, education, social welfare, workplaces, communities, and other relevant sectors. By integrating innovative information technology and digital techniques, the existing Tele-MANAS service and other digital mental health services should be made more accessible, robust, and effective.Alongside this, there must be a commitment to providing appropriately trained professionals, ensuring confidentiality, and upholding ethical safeguards. Higher education institutions—including universities and colleges—must mandatorily establish comprehensive mental well-being systems for students, while professional workplaces should implement advanced, evidence-based policies that promote psychological well-being and a healthy work environment. Continuous public education and awareness programs should be promoted to reduce the stigma associated with mental health issues and improve mental health literacy among the general public. The government should provide greater support at the national level for mental health research, implementation science, innovation, and evidence-based policy development. Mental

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

health data systems should be strengthened to support effective planning, monitoring, and evaluation of mental health services. Moving beyond outdated mindsets, we must make rehabilitation, recovery, and social inclusion integral components of long-term mental health care, enabling individuals who have overcome mental health issues to participate meaningfully in family, education, employment, and community life. The development, implementation, and evaluation of mental health policies and programs should actively involve members of society who have direct experience of mental health problems. We believe that, in keeping with the overall "Mental Health 2047" vision, we must fundamentally develop mental health policies that are rights-based, person-centered, culturally appropriate, inclusive, and evidence-based, so that a clear focus can be placed on prevention, recovery, dignity, and population-level mental well-being in the future.

Conclusion:

The government should regard the mental health protection policy as a crucial component of India's development journey leading up to 2047. The evidence and policy experiences presented in this research paper indicate that India has established a robust foundation through national mental health programs, policy formulation, legislation, community-based services, and digital initiatives. However, significant gaps persist across India regarding access to mental health services, affordability, workforce availability, treatment accessibility, prevention, rehabilitation, social inclusion, and awareness about mental health. These challenges demonstrate the continued need for a long-term, coordinated, and citizen-centric approach to the development of mental health in India. The 'Mental Health and Wellness 2047 Model' proposed in this research paper employs 10 interconnected strategic pillars to address these shortcomings in current mental health services. These strategic pillars encompass key areas such as mental health promotion and prevention, early identification and intervention, community-based care, child and adolescent mental health, suicide prevention, digital mental health, educational institutions, workplace wellness, workforce development, research and innovation, and recovery and social inclusion. Together, these pillars create a comprehensive and robust framework for enhancing mental health services, guiding service recipients beyond a narrow, treatment-focused perspective toward a broader vision of lifelong mental well-being. The central argument of this research paper is that mental health should not be confined merely to the healthcare sector for citizens; rather, it should be integrated into India's broader agenda for human-capital, educational, professional, social, and economic development. Investment in mental health by any nation can not only contribute to the well-being of its citizens but also play a vital role in fostering healthy families, productive workplaces, better educational outcomes, strong communities, and sustainable national development. Therefore, the Government of India should integrate mental health policies and programs into the broader development plan and promote them through sustained investment, research, innovation, community participation, and multi-sectoral collaboration, in order to achieve the 'Mental Health and Wellness 2047 Model'. The desired transformation for the 'Mental Health and Wellness 2047 Model' in India can be summarized as a shift from illness to wellness, from treatment to prevention, from institutions to communities, from stigma to inclusion, and from fragmented services to an integrated mental health ecosystem. Realizing the shift envisioned by the 'Mental Health and Wellness 2047 Model' will require sustained commitment in the future from the government, healthcare professionals, educational institutions, workplaces, communities, civil society organizations, researchers, families, and individuals. Therefore, through this research paper, we commit to the vision that a 'Developed India' in 2047 should not only be economically prosperous and technologically advanced, but every citizen within it should also be mentally healthy, psychologically resilient, socially inclusive, and capable of supporting the well-being of fellow citizens throughout their lives.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

The true success of 'Mental Health 2047' in India will be measured not merely by expanding mental health facilities or increasing the number of professionals, but by the capacity of every citizen to recognize mental health issues, access timely and appropriate help from service providers, recover with social dignity, and contribute meaningfully to society upon recovery. Working together with the government, we must adopt the perspective that by 2047, mental health should become a vital foundation of a healthy, inclusive, strong, and developed India—one to which mentally healthy citizens can contribute.

Acknowledgement
I would like to express my sincere gratitude to all those who contributed directly or indirectly to the completion of this research paper titled "Mental Health and Wellness in India 2047: Vision and Mission." I am deeply thankful to my academic institution and the Department of Psychology for providing the necessary academic environment, encouragement, and support to undertake this conceptual and policy-oriented study.

Abstract

As India strives toward the vision of Viksit Bharat (Developed India) by 2047, the transformation of its human capital through education and skill development has emerged as a critical strategic imperative towards employability. This research paper examines the pivotal role of the National Education Policy (NEP) 2020 in reshaping India's skill ecosystem, aiming to transition it from a fragmented, low-status pathway into a dynamic engine of youth empowerment and economic growth. By synthesizing empirical evidence from recent studies and policy analyses, this study evaluates how the framework of NEP 2020 enhances skill development and employability The study also investigates how various skills like perseverance, collaboration, information literacy, creativity, soft skills, technological skills, social skills, and media literacy embedded through NEP 2020 results in employability. Findings suggest that NEP 2020 provides a robust theoretical foundation for enhancing employability and fostering a knowledge economy to catalyze socio-economic transformation, ensuring that education and skill development serve as the cornerstone of sustainable national development and the realization of Viksit Bharat 2047.

Keywords: *National Education Policy 2020, NEP 2020, Skill development, Employability, Vocational education, 21st-century skills, Viksit Bharat 2047, Workforce readiness and Entrepreneurship education*

Introduction:

India's vision of becoming a Viksit Bharat (Developed India) by 2047 depends not only on infrastructure, technology, and investment, but fundamentally on the quality and employability of its people. India is projected to have the largest workforce globally by 2027, with a median age of 28.1 years. This "demographic dividend" can become a powerful engine of growth only if young people are equipped with relevant skills, practical competencies, and workforce readiness. For decades, however, the education system has emphasized rote learning and academic credentials over industry-aligned skills and experiential learning, leading to a persistent skills gap, underemployment, and educated unemployment. Skill development addresses this mismatch by boosting productivity and efficiency, fostering entrepreneurship, and enhancing India's global competitiveness through a workforce capable of meeting international standards. The National Education Policy (NEP) 2020 provides a strategic framework to bridge this gap by integrating vocational education and skill-based learning from Grade 6 onwards, aiming to have vocational exposure by all students by 2030. Recent policy recommendations, such as General Employability and Entrepreneurship Skills (GEES) from Classes 6–12 and structured Kaushal Tracks from Class 9, further reinforce this shift toward lifelong, outcome-oriented skilling. In this context, skill development is central to the Viksit Bharat agenda: it connects education with employment, transforms graduates into productive workers and job creators and ensures that opportunities across manufacturing, services, digital and green economies are matched by a capable, future-ready.

Literature Review

Literature consistently links skill development and employability to India's vision of a Viksit Bharat by 2047, stressing that growth depends on a skilled, adaptable workforce, not just infrastructure and investment. NEP 2020 is widely studied as a reform framework that shifts education from rote learning to holistic, competency-based, and experiential learning, promoting work readiness, work happiness, and lifelong learning. NEP 2020 as an enabling policy for a skilled, productive, and globally competitive workforce. NITI Aayog's skilling vision stresses that skilling must begin early, be embedded in schools, and include communication, digital basics, financial literacy, teamwork, problem-solving, and entrepreneurship. This aligns well with the idea that India's development by 2047 depends not just on expanding education, but on converting education into employability and innovation capacity. Overall, skill development is connected to self-reliance, innovation, and socioeconomic mobility, though gaps in implementation, infrastructure, and industry linkages remain.

Research Methodology

Research Design

This study adopts a descriptive and analytical research design based entirely on secondary data. It examines how NEP 2020–aligned policies and reports describe the role of skill development, vocational education, and employability skills in preparing India's youth for a Viksit Bharat by 2047

Objectives of the Study

1. To analyze how NEP 2020 and related policy documents conceptualize skill development and employability.
2. To synthesize existing evidence on the integration of vocational education from early stages and its expected impact on workforce readiness.
3. To evaluate reported outcomes and challenges related to 21st-century skills and the Employability Skills module.
4. To draw conclusions on how secondary evidence supports the argument that skill development is central to Viksit Bharat.

Sources of Secondary Data

A. Policy and Government Documents

- **National Education Policy (NEP) 2020** – Ministry of Education, Government of India
- **National Curriculum Framework (NCF) 2023**
- Reports and press releases from:
  - **Ministry of Education** (PIB releases on NEP implementation)
  - **NITI Aayog** – e.g., *"Reimagining Skilling for Viksit Bharat@2047"*
  - **National Skill Development Corporation (NSDC)** – data on vocational training and employment outcomes

B. Academic and Research Literature

- Peer-reviewed journal articles on NEP 2020, skill development, and employability (e.g., Frontiers in Education, IJIRT, Journal of IJAR, Zenodo working papers)
- Conference papers, dissertations, and policy briefs focusing on:
  - Vocational education in schools
  - 21st-century skills and life skills
  - Employability and entrepreneurship under NEP 2020

➢ **Limitations**

- Findings depend on the quality and availability of existing documents and reports.
- The study reflects reported intentions and early evidence, not long-term outcomes of NEP 2020 implementation.
- Some implementation details may vary across states and institutions, which may not be fully captured in national-level documents

Findings:

1. Skilled, multidisciplinary workforce as a national priority: India's growth strategy requires an educated, skilled, and multidisciplinary workforce aligned with global standards. NEP 2020 shifts education from rote learning to holistic, competency-based, and experiential learning to enhance employability.

2. Redefining teaching, assessment, and work preparation: NEP 2020 transforms pedagogy, assessment, and mentoring, emphasizing work readiness, work happiness, and lifelong learning so students become job-seekers, innovators, and entrepreneurs.

3. Focus on 21st-century and life skills: The policy prioritizes creativity, collaboration, communication, critical thinking, problem-solving, digital literacy, and life/social skills as core competencies embedded through projects and real-world tasks.

4. Early and systematic vocational education: Vocational education starts from Class 6 via experiential learning, Kaushal Bodh, and 10 bagless days (Classes 6–8), and NSQF-aligned skill courses linked to job roles for Classes 9–12.

5. Alignment with labor market and global needs: Curricula are aligned with labor market demands, digital transformation, and emerging sectors. NSDC reports that vocational training can raise employment rates by 50–70% post-completion.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

6. Mandatory Employability Skills Module: Vocational courses include a compulsory module on communication, self-management, ICT, entrepreneurship, and green skills, ensuring both technical and soft skills for workplace readiness.
7. Skill development for self-reliance and mobility: Skilling reduces reliance on traditional jobs, builds confidence, improves socioeconomic status, and enables diverse careers including entrepreneurship, making youth agents of change for a resilient, sustainable India.

Conclusion

India's journey toward a Viksit Bharat by 2047 will ultimately be determined by the quality, skills, and employability of its people, not just by infrastructure or investment. The introduction and findings together show that skill development is the bridge between education and employment, transforming students from passive learners into productive workers, innovators, and entrepreneurs. NEP 2020 provides the policy backbone for this transformation by:

- Integrating vocational education from Class 6 and making skill learning a core part of schooling.
- Embedding 21st-century skills—creativity, collaboration, communication, problem-solving, and digital literacy—into everyday learning.
- Introducing a mandatory Employability Skills module to ensure students are workplace-ready in both technical and soft skills.
- Aligning education with labor market needs and global standards to improve job outcomes and reduce unemployment gaps.

When implemented effectively, this approach can convert India's demographic dividend into a skills dividend, where young people are not only job-ready but also capable of creating jobs, driving innovation, and contributing to a self-reliant, sustainable economy. In this sense, skill development under NEP 2020 is not an add-on; it is central to realizing the vision of a prosperous, developed India by 2047.

Acknowledgement

I would like to express my sincere gratitude to all those who contributed directly or indirectly to the successful completion of this research paper, "The Role of NEP 2020 in Enhancing Skill Development and Employability: A Study in context of Viksit Bharat 2047." I am deeply thankful to the Ministry of Education, Government of India, and other concerned government institutions for providing valuable policy documents, reports, and information related to the National Education Policy (NEP) 2020, skill development, vocational education, and employability.

Abstract

Artificial Intelligence (AI) is increasingly being used to improve public service delivery through automation, data analysis, decision support and digital interaction. In India, Digital India, Digital Public Infrastructure and national AI initiatives have created opportunities to make government services more efficient, accessible and responsive. At the same time, AI-enabled public services raise concerns related to privacy, transparency, bias, accessibility, accountability and citizen trust. This paper examines how a Human-Centred AI (HCAI) approach can support sustainable digital governance in India through a structured review of secondary literature. Recent peer-reviewed studies, government reports and institutional publications are examined using thematic analysis. The review focuses on citizen-centric service delivery, accessibility and inclusion, transparency and explainability, privacy and security, fairness, citizen trust, and human oversight. The findings indicate that AI can support intelligent service discovery, conversational assistance, multilingual interaction, personalisation and routine administrative processing. However, technological capability alone does not guarantee better public services. AI must be designed around citizen needs and supported by appropriate governance safeguards. Based on the synthesis, the paper proposes a conceptual Human-Centred AI Framework with five interconnected dimensions: human needs, inclusive digital experience, responsible AI, accountable governance and sustainable public value. The paper concludes that India's AI-enabled digital governance should balance technological innovation with accessibility, privacy, fairness, transparency, human oversight and public trust.

Keywords: *Artificial Intelligence, Human-Centred AI, Digital Governance, Digital Public Services, Digital India, Digital Public Infrastructure, Responsible AI, Citizen-Centric Governance, Sustainable Development.*

Introduction

Artificial Intelligence (AI) is creating new possibilities for public administration and digital service delivery. Governments are increasingly using AI for data analysis, automation, decision support, citizen interaction and personalised services. Digital government is also important for sustainable development because effective digital services can improve access, efficiency and inclusion. In India, AI is becoming an important part of the wider digital transformation agenda. NITI Aayog's National Strategy for Artificial Intelligence introduced the vision of 'AI for All' and identified the potential of AI to support social and economic development (NITI Aayog, 2018). The growth of Digital India and Digital Public Infrastructure has further created a foundation for delivering government services through digital platforms. However, technological capability alone does not determine the quality of a public service. Citizens differ in language, digital literacy, accessibility needs and access to technology. A technically advanced system may still fail if people cannot understand, access or trust it. This makes a Human-Centred AI approach important. HCAI places people, their needs and their interaction with technology at the centre of AI development.

In public services, this means giving attention to usability, accessibility, transparency, fairness, privacy, accountability and human oversight. NITI Aayog's responsible AI principles similarly emphasise safety, equality, inclusivity, privacy, transparency and accountability (NITI Aayog, 2021).

Objectives of the Study

To examine the major applications and potential benefits of Human-Centred AI in India's digital public services.

To identify key challenges and risks associated with AI-enabled digital governance in India.

To examine how Human-Centred AI can support inclusive, responsible and sustainable digital governance in India.

Review of Literature

Recent research shows that AI can improve public services while also creating important governance challenges. In an India-specific study, Chatterjee, Khorana and Kizgin (2022) found that greater breadth and depth of AI-enabled service assimilation can improve citizen satisfaction and create public value. This supports the view that AI should be assessed not only by technical performance but also by the value experienced by citizens. Citizen acceptance is another important issue. Gesk and Leyer (2022) found that citizens' acceptance of AI differs across public-service situations and that concerns about AI can strongly influence acceptance. Horvath et al. (2023) found that human involvement, transparency, accuracy, data sharing and appeals mechanisms can influence acceptance and perceived fairness. Haesevoets et al. (2024) similarly found that citizens generally prefer AI to play a supporting or advisory role rather than having full decision-making authority. Research also connects AI use with citizen experience. Chen et al. (2021) found that user experience with AI-based public-service technology is influenced by factors such as personalisation and perceived time, while trust in government can affect these relationships. Kinder et al. (2023) emphasised that ethical AI in local public services requires citizen involvement, learning between service providers and users, and attention to explainability and nderstandability.

At the organisational level, Ahn and Chen (2022) found that government employees' support is important for successful AI implementation and highlighted the importance of training and understanding AI. Madan and Ashok (2023), through a systematic literature review, identified technological, organisational and environmental factors that influence AI adoption in public administration and linked AI diffusion with public value creation. Citizen-centricity provides an important foundation for Human-Centred AI. Sundberg and Holmström (2024) reviewed research on citizen-centricity in digital government, while Dechamps, Simonofski and Burnay (2025) identified user, governance, design and end-result perspectives of citizen-centricity. Together, these studies support a shift from technology-centred government towards services designed around citizens. Trust and responsible AI are also central. Kleizen et al. (2023) found that simply communicating ethical AI principles does not automatically create citizen trust and that existing privacy concerns can remain important. Overall, existing literature provides strong evidence on AI adoption, citizen satisfaction, trust, ethics and digital inclusion, but these issues are often examined separately. This study addresses this gap by bringing them together in an integrated Human-Centred AI framework for India's digital governance.

Research Methodology

This study uses a qualitative structured literature review based entirely on secondary data. It does not involve surveys, interviews or experiments. The study reviews academic research and institutional evidence related to Human-Centred AI, digital governance, AI-enabled public services and sustainable digital development in India.

Secondary data were drawn from peer-reviewed journal articles, conference proceedings, government reports, policy documents and publications from international organisations. Relevant literature was identified through academic sources such as Scopus, Web of Science, Google Scholar, ScienceDirect, SpringerLink and IEEE Xplore. Recent literature, mainly from 2020 to 2026, was prioritised along with selected foundational sources. The search used combinations of terms such as 'Human-Centred AI', 'AI and Digital Governance', 'AI and Digital Public Services in India', 'Responsible AI', 'AI and Digital India', 'AI and Citizen-Centric Governance' and 'AI and Digital Inclusion'. Sources were selected for relevance to AI, digital public services, accessibility, privacy, transparency, fairness, accountability, trust and sustainability. The selected literature was analysed through thematic analysis. Findings were grouped into themes covering citizen-centric service delivery, accessibility and inclusion, privacy and security, transparency and explainability, fairness, citizen trust, human oversight and sustainable public value.

5. Thematic Analysis and Findings

1. AI and Citizen-Centric Services

AI can make government services easier to find and use. Intelligent search can help citizens locate relevant schemes and services, while conversational

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

systems can guide users through procedures in simple language. AI can also support personalised information and routine administrative processing. These uses can improve service efficiency and citizen experience (Chatterjee et al., 2022; van Noordt & Misuraca, 2022).

2. AI and Accessibility

AI can support voice interaction, translation, multilingual communication, speech-to-text, text-to-speech and simplified information. These features can reduce barriers for citizens with different languages, digital skills and accessibility needs. However, accessibility should be judged by whether citizens can actually understand and complete their tasks, not only by whether a technical feature exists.

3. AI and Citizen Engagement

AI can make communication with government more interactive through chatbots and other digital interfaces. It can reduce the effort required to search through complex information. However, AI should support citizen participation rather than replace it. Citizens should still be able to provide feedback, report problems and contact human officials when needed (Wilson, 2022).

4. Privacy and Data Security

AI-enabled government services may use sensitive personal information. Strong privacy and security measures are therefore essential. Research on government AI also highlights the need to consider privacy risks associated with large-scale analysis and prediction of citizen behaviour (Saura et al., 2022).

5. Transparency and Explainability

Citizens may find it difficult to trust AI when they do not understand how an important decision was reached. Where AI significantly influences a public-service decision, citizens should receive clear explanations and have a way to seek clarification or human review. Transparency and explainability are therefore part of good citizen experience, not only technical requirements (Horvath et al., 2023; Kinder et al., 2023).

6 Fairness and Non-Discrimination

AI systems learn from data, and data may contain existing inequalities or bias. If these problems are not identified, AI may produce unfair results for particular groups. Government AI should therefore be checked for fairness across different social, economic, demographic and language groups. Human oversight remains important because technical accuracy alone cannot capture every form of unfairness.

7 Human Oversight and Accountability

Human involvement is important when AI supports consequential public decisions. AI can assist government employees with information processing and routine tasks, but responsibility should remain clear. Citizens should have access to human review, complaints and appeal mechanisms. Research shows that citizens often prefer AI to have a supporting role rather than complete decision-making authority (Horvath et al., 2023; Haesevoets et al., 2024).

Case Studies of Indian Digital Public-Service Platforms

To examine the practical relevance of the proposed Human-Centred AI (HCAI) framework, selected Indian digital public-service platforms were reviewed as illustrative case studies. The platforms selected—UMANG, DigiLocker, Aadhaar, CoWIN and myScheme—represent different aspects of India's digital public infrastructure, including integrated service delivery, digital documentation, digital identity, public-health service management and government-scheme discovery. The case studies are not intended to establish that each platform is an AI system. Rather, they are examined through a Human-Centred AI perspective to understand how human needs, inclusive digital experience, responsible technology, accountability and public value are addressed in large-scale digital governance.

1. UMANG: Integrated Access to Government Services

UMANG (Unified Mobile Application for New-age Governance) is developed by the Ministry of Electronics and Information Technology (MeitY) and the National e-Governance Division (NeGD). It provides citizens with a single platform for accessing government services across central, state and local government bodies. The official UMANG platform describes itself as a one-stop gateway to government schemes and services through multiple channels, including mobile applications, website, chatbot and voice bot. It brings together services and schemes from different government departments in one interface. From a Human-Centred AI perspective, UMANG demonstrates the importance of reducing the cognitive and procedural effort required from citizens. Instead of requiring citizens to identify and navigate multiple departmental websites, an integrated interface allows them to discover services through a common platform. The availability of multiple interaction channels is particularly relevant to inclusive digital experience because citizens differ in their digital skills, preferred modes of interaction and accessibility requirements. The platform also

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

integrates access to documents such as Aadhaar, driving licence and PAN through DigiLocker-related services. The case of UMANG therefore illustrates the HCAI principles of **service simplification, service discovery, accessibility and citizen-centred interaction**. At the same time, integration of multiple government services creates a need for strong privacy protection, consistent usability standards, reliable service information and clear accountability among participating departments. Thus, the human-centred value of UMANG depends not only on the availability of services but also on whether citizens can successfully understand, access and complete their intended tasks.

2. DigiLocker: Digital Documents and Citizen Empowerment

DigiLocker is a flagship initiative of the Ministry of Electronics and Information Technology under the Digital India programme. It provides citizens with a secure digital platform for storing, accessing, sharing and verifying authentic digital documents and certificates. The official platform describes DigiLocker as a digital document wallet intended to empower citizens by providing access to authentic documents.

A significant human-centred characteristic of DigiLocker is its emphasis on **convenience and reduced dependence on physical documents**. Citizens can access documents from different categories, while issued documents can be fetched directly from participating issuing authorities. DigiLocker also supports document sharing with citizen consent and enables organisations to verify documents electronically.

Responsible technology is particularly important in this case because digital documents involve personal information. The DigiLocker technology architecture includes access-rights management, two-factor authentication, encryption and time-stamping mechanisms intended to support secure data exchange and auditability. From the HCAI perspective, DigiLocker demonstrates how **user convenience, consent, security, interoperability and trust** can be incorporated into digital public services. The platform also illustrates that responsible digital governance is not limited to AI decision-making; privacy, transparency and citizen control remain important across the wider digital ecosystem.

3. Aadhaar: Digital Identity and Authentication.

Aadhaar, administered by the Unique Identification Authority of India (UIDAI), provides a digital identity infrastructure that enables identity authentication for various services and benefits. UIDAI explains that Aadhaar authentication allows requesting entities to verify the identity of an Aadhaar number holder through demographic information, OTP or biometric-based methods. The authentication service is provided online and in real time. Aadhaar demonstrates the importance of **interoperability and scalable digital infrastructure** in public-service delivery. UIDAI provides authentication services to government, public and private entities, enabling identity verification to be integrated into service-delivery processes. The ecosystem is designed for large-scale authentication and includes technical and security standards for participating entities. From a Human-Centred AI perspective, Aadhaar raises both opportunities and governance responsibilities. Digital identity can reduce repetitive identity-verification requirements and facilitate access to services. However, because identity systems involve highly sensitive personal information, **consent, privacy, security, transparency and alternative mechanisms for individuals who cannot use Aadhaar authentication** are essential. UIDAI states that, where an Aadhaar number has not been assigned, an individual should be offered an alternate and viable means of identification for delivery of a subsidy, benefit or service.

UIDAI also provides mechanisms through which Aadhaar holders can monitor authentication activity and lock or unlock their Aadhaar number or biometrics. These features provide citizens with a degree of control over authentication and contribute to the principles of privacy and user empowerment.

Aadhaar therefore illustrates that **responsible digital identity requires more than technological accuracy**. Human-centred governance must ensure that identity infrastructure remains secure, accessible, accountable and accompanied by appropriate safeguards.

4. CoWIN: Human-Centred Digital Public Health Service

CoWIN was developed as the digital platform supporting India's COVID-19 vaccination programme. According to the Government of India's Press Information Bureau, CoWIN connected vaccine manufacturers, administrators, healthcare workers, vaccination facilities and beneficiaries through a common digital platform. Its features included online and on-site registration, appointment scheduling, vaccination tracking, digital certificates, multilingual access, real-time dashboards and monitoring of adverse events following immunisation.

CoWIN provides a particularly relevant example of **inclusive service design at national scale**. The platform supported online registration while also allowing walk-in registration and assisted registration for beneficiaries who did not have

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

access to digital technology. Government guidance also enabled registration through Common Service Centres and allowed multiple beneficiaries to be registered using a single mobile number.

The platform also incorporated mechanisms for appointment management, digital certification and grievance-related functionality. The Government of India described CoWIN as having a grievance-management system with a "Raise an Issue" feature, demonstrating the importance of mechanisms through which citizens can report problems and seek resolution. From an HCAI perspective, CoWIN demonstrates that **digital inclusion cannot depend exclusively on self-service technology**. Online access needs to be complemented by assisted channels, walk-in facilities, multilingual communication and mechanisms for resolving problems. The case also demonstrates the importance of interoperability: CoWIN was integrated with applications such as UMANG and DigiLocker, allowing vaccination certificates to be accessed through connected digital platforms.

CoWIN therefore provides a strong example of how **human needs, inclusive experience, interoperability, accountability and public value** can be incorporated into large-scale digital public-service delivery.

5. myScheme: Personalised Government-Scheme Discovery

myScheme is a National Platform developed to simplify the discovery of government schemes and benefits. Its official platform describes its mission as streamlining the government-user interface and reducing the time and effort required to find and access relevant schemes. It brings information about schemes from the Central Government, State Governments and Union Territories into a single discovery platform.

The platform is particularly relevant to the concept of **citizen-centric service discovery**. Citizens can enter basic information such as demographic, income and social details, after which the platform identifies relevant schemes based on eligibility. It also provides scheme details, eligibility criteria and application guidance.

This approach reduces the information burden placed on citizens. Rather than expecting individuals to understand the structure of different government departments and independently search multiple websites, myScheme provides a more user-oriented pathway from **citizen information → eligibility → relevant scheme → application information**.

From an HCAI perspective, myScheme is especially significant because it demonstrates how technology can support **personalised service discovery without necessarily transferring decision-making authority to an automated system**. The platform can help citizens identify potentially relevant schemes while maintaining the role of government departments in determining eligibility and processing applications.

The case highlights the importance of understandable information, transparent eligibility criteria, accessibility and citizen empowerment. It also demonstrates the potential of data-driven service discovery to create public value when it is designed around citizens' actual information needs.

6. Comparative Analysis of the Case Studies

The five case studies demonstrate different pathways through which digital public infrastructure can support human-centred governance. UMANG focuses primarily on integrated service access; DigiLocker focuses on trusted digital documents; Aadhaar provides identity authentication infrastructure; CoWIN demonstrates large-scale public-health service delivery; and myScheme focuses on scheme discovery and eligibility-based information. The comparison also demonstrates an important distinction between **digitalisation and Human-Centred AI**. A service may be digitally advanced without necessarily being AI-driven. The HCAI perspective therefore evaluates the wider citizen experience and governance environment, including accessibility, privacy, transparency, consent, human support, grievance mechanisms and citizen empowerment.

Platform	Primary Public-Service Function	Human-Centred Strength	Responsible Technology / Governance Consideration	Public Value
UMANG	Integrated access to government services and schemes	One-stop service discovery and multiple interaction channels	Privacy, consistency of information, inter-departmental accountability	Reduced effort and easier access to public services
DigiLocker	Digital storage, access, sharing and verification of documents	Anytime access and reduced dependence on physical documents	Consent, authentication, encryption, access control and auditability	Faster and more efficient document-based service delivery

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Aadhaar	Digital identity authentication	Real-time identity verification supporting service delivery	Consent, privacy, security, alternative identification and user control	Scalable identity infrastructure and simplified verification
CoWIN	Vaccination registration, scheduling, tracking and certification	Online, walk-in and assisted access; multilingual service	Data security, grievance mechanisms, accessibility and interoperability	Large-scale, coordinated public-health service delivery
myScheme	Government-scheme search and eligibility-based discovery	Personalised scheme discovery and reduced information burden	Clear eligibility information, transparency and responsible use of citizen data	Improved awareness and access to government benefits

Source: Compiled by the authors from official Government of India sources.

The comparative analysis indicates that no single platform represents all five dimensions of the proposed HCAI framework equally. Instead, different platforms demonstrate different strengths. UMANG illustrates **inclusive digital experience and service integration**; DigiLocker demonstrates **security, consent and trusted digital exchange**; Aadhaar highlights **identity infrastructure, scalability and privacy governance**; CoWIN demonstrates **inclusive access, interoperability and grievance support**; and myScheme illustrates **citizen-oriented information discovery and personalisation**.

These cases collectively support the argument that successful digital governance should not be assessed solely through technical capability or the number of services delivered. The citizen's ability to understand, access, trust and successfully use a service is equally important. This finding is consistent with the central argument of the present study that technology should be connected with human needs, inclusive experience, responsible technology, accountable governance and sustainable public value.

6.7 Case Studies in Relation to the Proposed HCAI Framework

The case studies provide practical illustrations of the five dimensions proposed in this study:

1. **Human Needs:**
2. UMANG and myScheme reduce the effort involved in finding government services and schemes, while DigiLocker reduces the need to manage physical documents. CoWIN addressed practical vaccination needs through appointment scheduling, certification and assisted access.
3. **Inclusive Digital Experience:**
4. UMANG provides multiple access channels, CoWIN incorporated online, walk-in and assisted registration, and myScheme simplifies the process of discovering relevant schemes. These examples demonstrate that inclusion requires attention to citizens with different levels of digital access and literacy.

3. Responsible AI and Technology:

DigiLocker demonstrates consent-based document exchange and security mechanisms, while Aadhaar provides authentication controls and privacy-related safeguards. These cases show that responsible technology principles must be embedded into the wider digital infrastructure, even where a particular service is not itself an AI system.

5. **Accountable Governance:**
6. CoWIN's grievance-related functionality, Aadhaar's authentication history and control mechanisms, and the involvement of multiple government departments in platforms such as UMANG demonstrate the importance of traceability, oversight and mechanisms for citizen recourse.

5.

The combined objective of these platforms is to reduce administrative friction, improve access, increase service efficiency and empower citizens. Their long-term public value, however, depends on continued attention to accessibility, privacy, reliability, transparency and citizen trust.

Overall, the case studies strengthen the proposed conceptual framework by showing that Human-Centred AI in digital governance should be understood as a **socio-technical approach**, rather than simply as the introduction of AI algorithms into government services. The value of intelligent and digital public services emerges when technological capability is aligned with citizen needs and supported by inclusive design, responsible data practices, accountable institutions and mechanisms for human intervention.

Figure 1: Human-Centred AI Framework for Sustainable Digital Governance

7. Proposed Human-Centred AI Framework for Sustainable Digital Governance

Based on the thematic synthesis, this study proposes a conceptual Human-Centred AI Framework for Sustainable Digital Governance in India. The framework connects five dimensions that should work together.

1. Human Needs: Understand citizens' needs, digital literacy, language, accessibility and service expectations.

2. Inclusive Digital Experience: Make services simple, accessible, multilingual, understandable and easy to navigate.

3. Responsible AI: Apply privacy, security, safety, fairness, non-discrimination, transparency and explainability.

4. Accountable Governance: Provide human oversight, clear responsibility, monitoring, auditing, grievance redressal and human intervention.

5. Sustainable Public Value: Ensure long-term benefits through efficient services, inclusion, trust, equitable access and citizen empowerment.

The framework can be viewed as a continuous process: human needs guide design; inclusive experience guides interaction; responsible AI guides system behaviour; accountable governance provides oversight; and the combined outcome should create sustainable public value. Citizen feedback and continuous monitoring should inform improvement. The framework is conceptual and has not been empirically validated in this study.

Interpretation of Findings and Implications

The findings show that the future of digital governance cannot depend only on the availability of AI technology. AI can improve service delivery, but its social value depends on how it is designed, implemented and governed.

Human-Centred AI provides a link between technological innovation and citizen needs. This is particularly important in India because citizens differ in language, literacy, accessibility, digital skills and access to infrastructure. The findings also show that responsible AI and user experience are closely connected. Privacy, transparency, fairness and accountability directly influence how citizens experience and trust digital services. An AI system may be technically accurate but still provide a poor experience if citizens cannot understand its decisions or challenge an outcome. The proposed framework therefore combines human needs, inclusive experience, responsible AI, accountable governance and sustainable public value. This approach can help ensure that the next stage of India's digital transformation remains citizen-centred, inclusive and accountable.

Key Suggestions

Keep citizens at the centre: Design AI services around citizens' needs and ease of use.

Improve accessibility: Provide multilingual, voice-based and easy-to-use services.

Ensure transparency: Give citizens simple explanations when AI is involved in important decisions.

Keep human oversight: Provide human support and review when required.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Protect personal data: Ensure strong privacy and security throughout the AI system.
Monitor AI services: Regularly check systems for accuracy, fairness, accessibility and reliability.
Encourage citizen feedback: Give citizens simple ways to report problems and share their experiences.
Promote collaboration: Bring together government officials, AI experts, designers and citizens while developing AI-enabled services.

Conclusion

Artificial Intelligence can play an important role in the next stage of India's digital transformation. It can improve service discovery, communication, accessibility, personalisation and administrative efficiency. However, the success of AI-enabled public services should not be measured only by technical performance. The literature reviewed in this study shows that citizen needs, accessibility, privacy, transparency, fairness, human oversight and trust are equally important. A Human-Centred AI approach can connect technological innovation with these human and governance requirements. The proposed framework provides a conceptual basis for Human-Centred AI in India's digital governance. Future research can validate the framework through citizen surveys, interviews, usability studies and case studies of Indian digital public-service platforms.

Limitations and Future Scope

The study is based exclusively on secondary data and therefore does not provide direct empirical evidence from citizens or government-service users. The findings represent a synthesis of existing academic and institutional literature. Future research can test the proposed framework through primary studies and evaluate specific Indian digital public services using measurable indicators for usability, accessibility, trust, fairness and citizen satisfaction.

Acknowledgement

The authors would like to express their sincere gratitude to D. Y. Patil International University, School of Applied Arts and Crafts, Akurdi, Pune, for providing an academic environment and support that facilitated the completion of this study on "Human-Centred AI for Sustainable Digital Governance in India: A Review of Digital Public Services." The authors are grateful to the researchers, scholars, government institutions, and international organisations whose published studies, reports, policy documents, and institutional resources contributed valuable insights to this structured literature review. The study particularly benefited from the existing literature on Human-Centred AI, responsible AI, digital governance, citizen-centric public services, privacy, accessibility, transparency, fairness, accountability, and citizen trust.

Abstract:

*Science has emerged as one of the most influential forces shaping economic growth, social transformation and national progress in the twenty-first century. The development of modern societies is increasingly dependent on the ability to create scientific knowledge, translate that knowledge into technological innovations and ensure that these innovations reach different sections of society. For a country such as India, which is simultaneously addressing issues of economic development, population growth, employment, education, healthcare, agriculture, energy security and environmental sustainability, science has a particularly important role to play. Scientific advancement can provide evidence-based and innovative solutions to complex national challenges while also strengthening India's competitiveness in the global knowledge economy. The vision of **Viksit Bharat @2047** represents India's aspiration to become a developed nation by the centenary of independence. This vision encompasses not merely higher economic growth but also improvements in human development, education, healthcare, infrastructure, employment, social equity, technological capability, environmental sustainability and quality of life. Science and technology can serve as connecting forces among these different dimensions of development. Advances in agricultural science can improve productivity and climate resilience; medical science can support affordable healthcare; digital technologies can improve access to public services and education; space science can support communication, navigation and disaster management; renewable-energy research can strengthen energy security; and emerging technologies such as artificial intelligence, biotechnology, robotics and quantum technologies can create new opportunities for innovation and economic growth. The present paper examines the multidimensional importance of science in India's development with particular reference to Viksit Bharat @2047. It adopts a descriptive and analytical approach based on secondary information obtained from policy documents, government reports, scientific institutions, educational literature and international development reports. The paper discusses the contribution of science to economic development, agriculture, healthcare, education, industry, digital transformation, space technology, renewable energy and environmental sustainability. It further explores the role of scientific education in developing curiosity, creativity, critical thinking, problem-solving ability and innovation among young people. The paper also identifies significant challenges, including unequal access to scientific resources, the digital divide, inadequate research infrastructure in some areas, limited industry-academia collaboration, shortage of specialised human resources, brain drain and the gap between scientific research and its practical application. The paper argues that the achievement of Viksit Bharat @2047 requires a transition from a technology-consuming society to a knowledge-generating and innovation-driven society. Strengthening scientific research, encouraging interdisciplinary collaboration, improving science education, supporting young researchers,*

promoting indigenous technologies and ensuring inclusive access to scientific innovations should therefore become important components of India's development strategy. Science must also be integrated with ethical considerations and environmental sustainability so that technological progress contributes to human welfare without creating new forms of inequality. The paper concludes that a scientifically literate population, a strong research ecosystem and an innovation-oriented economy are essential foundations for India's transformation into a developed, self-reliant, inclusive and sustainable nation by 2047.

Keywords: *Science, Technology, National Development, Viksit Bharat @2047, Scientific Education, Innovation, Research and Development, Digital Transformation, Sustainability, Atmanirbhar Bharat.*

Introduction:

The history of human development is closely connected with the advancement of scientific knowledge. Scientific discoveries have changed the way people understand nature, produce goods, communicate, travel, treat diseases and manage resources. From agricultural innovations to artificial intelligence, scientific progress has continuously expanded human capabilities. In the contemporary world, science is no longer confined to laboratories, universities and research institutions. It has become an important component of economic planning, public policy, national security, education, healthcare, agriculture and environmental management. Countries that possess strong scientific and technological capabilities are generally better positioned to respond to emerging challenges and participate effectively in the global economy. India has a large population, a young workforce, diverse geographical conditions and significant developmental requirements. The country therefore requires solutions that are scientifically sound, economically feasible and socially inclusive. Science can help address these requirements by generating knowledge and enabling the development of appropriate technologies.

India's progress in areas such as space research, pharmaceuticals, information technology, biotechnology, digital infrastructure, renewable energy and agricultural research demonstrates the country's growing scientific capability. These achievements provide a foundation for further development.

The vision of **Viksit Bharat @2047** provides a long-term framework for India's transformation into a developed nation. The vision requires progress in several interconnected areas. Economic prosperity must be accompanied by human development, quality education, good health, employment, technological advancement, environmental protection and social inclusion. In this context, science can be considered a cross-cutting foundation of development. The central argument of this paper is that India's journey towards Viksit Bharat @2047 cannot be separated from the development of its scientific and technological ecosystem.

Concept of Viksit Bharat @2047 :

Viksit Bharat @2047 refers to the long-term national vision of transforming India into a developed nation by 2047, when India will complete one hundred years of independence.

The concept of a developed India should not be restricted to economic indicators. Development should be understood through a broader framework consisting of:

- Economic prosperity
- Quality education
- Universal and affordable healthcare
- Modern infrastructure
- Technological capability
- Productive employment
- Social inclusion
- Environmental sustainability
- Gender equality
- Innovation and entrepreneurship
- Digital empowerment
- Human development
- National self-reliance

Science and technology have the potential to contribute to each of these areas.

For example, scientific research contributes to economic productivity; technology improves healthcare delivery; digital platforms expand educational access; agricultural science improves food security; renewable-energy technologies support sustainability; and innovation creates new industries and employment.

Thus, science should be viewed as an **enabler of multidimensional national development**.

Need for Science-Led Development in India:

India is experiencing rapid social, economic and technological transformation. At the same time, the country faces several complex challenges.

These include:

1. Increasing demand for energy
2. Agricultural and rural development challenges
3. Environmental degradation
4. Climate-related risks
5. Healthcare inequalities
6. Skill and employment requirements
7. Urbanisation
8. Water scarcity
9. Digital inequality
10. Need for technological self-reliance

Most of these challenges cannot be addressed effectively through traditional approaches alone.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Scientific research can provide new knowledge, while technological innovation can transform that knowledge into practical solutions.

For instance, climate-resilient agricultural technologies can help farmers respond to changing weather conditions. Digital healthcare can improve access to medical consultation in remote areas. Renewable energy can address energy requirements while reducing environmental pressure.

Therefore, science-led development is not merely about producing sophisticated technologies; it is about **using knowledge and innovation to improve human welfare**.

Objectives of the Study:

The major objectives of the present paper are:

1. To examine the importance of science in national development.
2. To analyse the contribution of science and technology to Viksit Bharat @2047.
3. To study the role of science in economic and industrial development.
4. To examine the contribution of science to agriculture and rural development.
5. To understand the role of science in healthcare and education.
6. To examine the contribution of emerging technologies to India's future development.
7. To identify major challenges affecting science-led development.
8. To suggest measures for strengthening India's scientific and innovation ecosystem.

Research Questions:

The paper addresses the following questions

1. Why is science important for India's national development?
2. How can scientific research contribute to Viksit Bharat @2047?
3. What role does scientific education play in creating future human capital?
4. How can technology promote inclusive and sustainable development?
5. What challenges may restrict India's scientific and technological progress?
6. What strategies can strengthen science-led development in India?

Methodology:

The study follows a **descriptive and analytical methodology**.

The paper is primarily based on secondary sources, including:

- Government policy documents
- Reports of scientific organisations
- Educational policy documents
- Development reports
- Research literature
- Reports of international organisations
- Publications related to science and technology

The collected information has been organised thematically under major areas of development. The analysis focuses on understanding how scientific knowledge and technological innovation can contribute to India's long-term development.

Review of Related Literature:

The relationship between science, technology and economic development has been widely discussed in development literature. Modern economic theories recognise knowledge and technological innovation as important contributors to productivity and long-term economic growth.The development experience of technologically advanced countries demonstrates that investment in research, education and innovation can contribute to industrial competitiveness and human development.In the Indian context, national science and technology policies have increasingly emphasised research, innovation, technological development and the application of science for societal benefit.The **National Education Policy 2020** places emphasis on multidisciplinary education, critical thinking, creativity, research and innovation. These educational priorities are closely connected with the development of scientific human capital.Similarly, India's growing focus on digital technologies, biotechnology, space research, renewable energy and advanced manufacturing indicates the increasing importance of science and technology in national planning.

However, the literature also indicates that scientific development should not be viewed exclusively from the perspective of technological advancement. Issues of accessibility, affordability, ethics, sustainability and social inclusion are equally important.

The present paper therefore adopts a broader perspective in which science is connected with **economic, social, educational and environmental development**.

Science and Economic Development:

Science contributes to economic development by improving productivity, creating new industries and enabling technological innovation. Scientific discoveries can lead to new products, production processes and services. These innovations can increase efficiency and create new employment opportunities.

Modern sectors such as:

- Information technology
- Biotechnology
- Pharmaceuticals
- Electronics
- Semiconductor manufacturing
- Renewable energy
- Advanced manufacturing

- Artificial intelligence

are strongly dependent on scientific knowledge.

For India, strengthening domestic research capabilities can reduce dependence on imported technologies and improve global competitiveness.

A knowledge-driven economy requires continuous investment in research, skilled human resources and innovation.

Therefore:

Science → Innovation → Productivity → Industry → Employment → Economic Growth

This development chain demonstrates the economic significance of science.

Science and Agricultural Development:

Agriculture remains an important component of India's rural economy and food system.

Indian agriculture faces multiple challenges such as:

- Changing climate
- Water scarcity
- Soil degradation
- Pest attacks
- Unpredictable weather
- Small landholdings
- Post-harvest losses

Science can contribute to agricultural development through improved crop varieties, soil analysis, weather forecasting, precision agriculture, agricultural machinery and efficient irrigation.

Remote sensing and satellite technology can provide information about crop conditions and natural resources.

Artificial intelligence can potentially support farmers through weather prediction, crop monitoring and pest identification.

Scientific agricultural practices can therefore contribute to:

Higher productivity + Efficient resource use + Climate resilience + Food security

Science and Healthcare Development:

Healthcare is a major indicator of human development.

Scientific advancement has resulted in major improvements in:

- Vaccination
- Medicines
- Diagnostic techniques
- Medical imaging
- Surgery
- Biotechnology
- Telemedicine
- Digital health
- Medical devices

India has developed significant capabilities in pharmaceutical production and vaccine-related research.

Future healthcare systems are likely to increasingly use artificial intelligence, genomics, robotics, telemedicine and digital health technologies. However, technological progress must be accompanied by affordability and accessibility. A developed healthcare system should ensure that scientific benefits reach both urban and rural populations.

Science and Education:

Education is the foundation of a knowledge society.

Science education has a particularly important role because it develops the ability to question, investigate, analyse and solve problems.

A scientifically oriented education system should develop:

Curiosity

Students should be encouraged to ask questions about natural and social phenomena.

Critical Thinking

Students should learn to evaluate information using evidence and reasoning.

Creativity

Science learning should provide opportunities for designing new solutions.

Problem-Solving

Students should apply scientific principles to real-life problems.

Innovation

Students should be encouraged to transform ideas into useful models and products.

Therefore, science education should move beyond memorisation towards **experiential and inquiry-based learning**.

Role of Teachers in Science-Led Development:

Teachers have a critical role in preparing the human resources required for Viksit Bharat.

A teacher can encourage scientific thinking by:

- Conducting experiments
- Organising science exhibitions
- Encouraging student projects
- Using educational technology
- Promoting questioning
- Connecting lessons with everyday life
- Encouraging problem-solving
- Supporting innovation

For example, a classroom project on **water conservation** can integrate science, environmental studies, mathematics, social responsibility and technology.

Similarly, students can develop low-cost models related to renewable energy, waste management or agricultural improvement.

Such activities can develop the next generation of innovators.

Science and Digital Transformation:

Digital technology has become an important component of India's development.

Digital systems can improve:

- Public administration
- Banking
- Education
- Healthcare
- Business
- Communication
- Financial inclusion

Artificial intelligence, machine learning, cloud computing, Internet of Things and data analytics are opening new possibilities.

However, technological development can create inequalities if access is not universal.

The digital divide may arise because of:

- Lack of internet connectivity
- High cost of devices
- Limited digital literacy
- Language barriers
- Poor digital infrastructure

Therefore, digital development must be accompanied by **digital inclusion**.

Science and Space Technology:

India's space programme demonstrates the strategic importance of science.

Space-based technologies support:

- Communication
- Navigation
- Weather monitoring
- Disaster management
- Agricultural planning
- Environmental monitoring
- Resource mapping

Satellite data can help monitor forests, water resources, agricultural land and natural disasters.

Space research also contributes to scientific education by motivating young people to study mathematics, science and engineering.

India's space capabilities therefore have both **developmental and inspirational value**.

Science and Industrial Development:

The fourth industrial revolution is changing manufacturing and employment.

Technologies such as:

- Artificial intelligence
- Robotics
- Automation
- 3D printing
- Advanced materials
- Internet of Things
- Semiconductor technologies

are transforming industrial processes.

India's industrial development will increasingly depend on its ability to adopt and develop these technologies.

The challenge is to ensure that technological transformation creates new employment and skill opportunities rather than widening inequality.

Therefore, technological development should be accompanied by:

Skill Development + Reskilling + Entrepreneurship + Innovation

Science and Renewable Energy:

India's future energy requirements are substantial.

Scientific research can help increase the efficiency and affordability of:

- Solar energy
- Wind energy
- Battery storage
- Electric mobility
- Green hydrogen
- Energy-efficient technologies

Renewable-energy research can contribute to both environmental sustainability and energy security.

The development of indigenous clean-energy technologies can also create new industries and employment opportunities.

Thus, science can help India move towards a **low-carbon development pathway**.

Science and Environmental Sustainability:

Economic development and environmental protection must progress together.

Science provides tools for understanding environmental changes and developing appropriate responses.

Scientific research supports:

- Climate modelling
- Pollution monitoring
- Water conservation
- Waste management
- Biodiversity protection
- Sustainable agriculture
- Disaster preparedness

For Viksit Bharat, development must be sustainable across generations.

The objective should therefore be:

Development today without compromising the ability of future generations to meet their needs.

Emerging Technologies and Viksit Bharat @2047:

Several emerging technologies may significantly influence India's development trajectory.

Artificial Intelligence:

AI can support healthcare, education, agriculture, manufacturing and governance.

Biotechnology:

Biotechnology can contribute to medicine, agriculture, food production and environmental management.

Quantum Technology:
Quantum technologies have potential applications in computing, communication and sensing.
Robotics:
Robotics can improve industrial productivity, healthcare and hazardous work environments.
Advanced Materials:
New materials can improve manufacturing, energy storage, transportation and construction.
Green Technologies:
Clean technologies can support sustainable economic development.
The effective adoption of these technologies will require skilled human resources, research infrastructure and ethical governance.

Science and Atmanirbhar Bharat:
Technological self-reliance is an important component of national development.
Dependence on imported critical technologies can create economic and strategic vulnerabilities.
Scientific research can support indigenous capabilities in:

- Electronics
- Semiconductors
- Pharmaceuticals
- Defence technologies
- Renewable energy
- Biotechnology
- Space systems
- Advanced manufacturing

Self-reliance does not mean isolation from global knowledge. Rather, it means developing sufficient domestic capabilities while actively participating in international scientific collaboration.

Science and Employment Generation:
Scientific development can create employment in both traditional and emerging sectors.
New opportunities can emerge in:

- Data science
- Artificial intelligence
- Biotechnology
- Renewable energy
- Robotics
- Healthcare technology
- Space technology
- Scientific research
- Advanced manufacturing

However, technological transformation may also change existing occupations.
Therefore, India's education and skill systems need to focus on continuous learning, reskilling and adaptability.

Science and Women Empowerment:
Women's participation in science and technology is essential for inclusive national development.
Greater participation of women in STEM can:

- Increase the scientific workforce
- Promote diverse perspectives
- Improve innovation
- Expand economic opportunities
- Strengthen social development

Schools and higher education institutions should encourage girls to pursue science, mathematics, engineering and technology.
A developed India requires the talents of **all sections of its population**.
Challenges to Science-Led Development:
Despite significant achievements, India faces several challenges.
Unequal Access to Scientific Resources
Students and institutions in rural and economically disadvantaged areas may have limited access to laboratories, equipment and digital resources.
Research Infrastructure
Advanced scientific research requires modern laboratories, specialised equipment and long-term funding.
Research-Industry Gap
Scientific discoveries may not always be transformed into commercial products and societal solutions.
Shortage of Skilled Human Resources
Emerging technologies require specialised knowledge and advanced skills.
Brain Drain
Researchers and highly skilled professionals may seek opportunities in other countries.
Digital Inequality
Unequal access to technology can limit the benefits of digital transformation.
Scientific Misinformation
The spread of misinformation and pseudoscientific claims highlights the need for stronger scientific literacy.
Ethical Issues
Artificial intelligence, biotechnology and data-driven technologies create questions related to privacy, fairness, employment and human rights.
Suggestions and Policy Measures:
To strengthen science-led development, the following measures are suggested:
Strengthen Research and Development
Long-term investment in fundamental and applied research should be increased.
Improve Scientific Infrastructure
Schools, colleges and research institutions should receive appropriate laboratories and modern equipment.
Promote STEM Education
Science, technology, engineering and mathematics education should be strengthened from the school level.
Encourage Innovation

Students and young people should receive opportunities to develop and test innovative ideas.

Strengthen University-Industry Collaboration

Universities and industries should jointly work on practical problems.

Support Young Researchers

Scholarships, fellowships, research grants and career opportunities should be expanded.

Reduce the Digital Divide

Affordable internet, devices and digital literacy programmes should reach underserved communities.

Promote Women in STEM

Special support should encourage women's participation in scientific and technological careers.

Encourage Indigenous Technology

Research should focus on technologies relevant to India's developmental requirements.

Strengthen Science Communication

Scientific information should be communicated in simple and accessible languages.

Promote Ethical Technology

Emerging technologies should be developed with appropriate ethical and social safeguards.

Encourage Sustainable Innovation

Scientific development should consider environmental consequences and long-term sustainability.

Proposed Conceptual Framework:

The role of science in Viksit Bharat @2047 can be represented through the following framework:

Scientific Education
↓
Scientific Knowledge
↓
Research & Development
↓
Innovation
↓
Technology
↓
Entrepreneurship & Industrial Development
↓
Employment & Productivity
↓
Inclusive Economic And Social Development
↓
Sustainable Development
↓
Viksit Bharat @2047

This framework indicates that science provides the knowledge base, education creates human capital, research produces new knowledge, innovation converts knowledge into solutions, and technology enables large-scale application.

Science for Inclusive Development:

The ultimate purpose of science should be human welfare.

Scientific achievements should benefit:

- Rural communities
- Farmers
- Students
- Women
- Workers
- Senior citizens
- Persons with disabilities
- Economically disadvantaged communities

For example:

Telemedicine can connect rural patients with specialists.

Digital education can expand access to learning resources.

Weather forecasting can assist farmers.

Solar technologies can provide cleaner energy.

Water purification technologies can improve access to safe drinking water.

Therefore, science becomes truly developmental when its benefits reach ordinary citizens.

Future Vision: India as a Knowledge Superpower

By 2047, India has the opportunity to strengthen its position as a major global knowledge and innovation centre.

To achieve this, India needs:

- Strong universities
- World-class research institutions
- Skilled scientists
- Innovative industries
- Technology-oriented startups
- Scientific entrepreneurs
- High-quality STEM education
- International research collaboration

The objective should not be simply to consume technologies developed elsewhere. India should increasingly become a country that **creates knowledge, develops technologies and contributes solutions to global problems**.

Discussion:

The analysis presented in this paper demonstrates that science has a multidimensional relationship with national development.

Its contribution extends beyond technological products. Science influences the quality of education, healthcare, agriculture, industry, energy systems, environmental management and governance.

However, scientific development alone cannot guarantee inclusive development. Scientific progress must be supported by appropriate institutions, skilled human resources, ethical governance and equitable access.

For this reason, the development strategy for Viksit Bharat @2047 should integrate:

Science + Education + Innovation + Industry + Sustainability + Inclusion

The country needs to create an ecosystem in which scientific knowledge can move efficiently from laboratories to society.

A successful innovation ecosystem can be represented as:

Idea → Research → Prototype → Innovation → Enterprise → Employment → Social Impact

Such an ecosystem can simultaneously contribute to economic development and social welfare.

Major Findings:

Based on the analysis, the following major findings emerge:

1. Science is a fundamental driver of modern national development.
2. Scientific education is essential for developing future human capital.
3. Research and innovation can strengthen India's economic competitiveness.
4. Science can improve agricultural productivity and climate resilience.
5. Medical science can contribute to accessible and affordable healthcare.
6. Digital technologies can expand opportunities in education, governance and business.
7. Space science has important applications in development and disaster management.
8. Renewable-energy research can support energy security and sustainability.
9. Emerging technologies can create new industries and employment opportunities.
10. Scientific development must be inclusive to ensure that technological progress benefits all sections of society.
11. Stronger collaboration between universities, industries and government is required.
12. Ethical and environmental considerations must accompany technological advancement.

Conclusion:

Science is not simply one component of development; it is a foundational force that influences almost every dimension of modern national progress. India's journey towards Viksit Bharat @2047 will depend significantly on its ability to generate scientific knowledge, develop innovative technologies and apply them effectively to national and local challenges. The vision of a developed India requires more than economic growth. It requires high-quality education, accessible healthcare, productive employment, technological self-reliance, environmental sustainability, social inclusion and improved quality of life. Science can contribute to all these objectives. Agricultural science can improve food security and farmers' livelihoods. Medical science can strengthen healthcare. Digital technologies can improve access to education and public services. Space technology can support communication and disaster management. Renewable-energy research can strengthen energy security. Artificial intelligence, biotechnology, robotics and quantum technologies can create new opportunities for economic transformation. At the same time, scientific progress must be accompanied by responsible governance. The benefits of technology should not remain concentrated among privileged groups. Rural communities, economically weaker sections, women and young people must have meaningful opportunities to participate in and benefit from scientific development.

The most important requirement is therefore the creation of a **scientific and innovation-oriented culture**. Students should be encouraged to question, investigate and create. Teachers should become facilitators of scientific thinking. Universities should become centres of research and innovation. Industries should collaborate with researchers. Government should provide supportive policies and infrastructure.

India's scientific journey towards 2047 should therefore move from:

Knowledge Consumption → Knowledge Creation
Technology Adoption → Technology Development
Job Seeking → Innovation and Entrepreneurship
Economic Growth → Inclusive and Sustainable Development

The ultimate goal should be a nation in which scientific progress improves the everyday lives of citizens and strengthens India's contribution to the world.

Thus, the vision can be expressed as:

Scientific Knowledge + Quality Education + Research + Innovation + Technology + Inclusion + Sustainability = Viksit Bharat @2047

A scientifically empowered population and a strong innovation ecosystem can provide the foundation for India's transformation into a developed, self-reliant, prosperous and sustainable nation by 2047.

Acknowledgement

The authors would like to express their sincere gratitude to all those who supported and encouraged the completion of this research paper entitled "Importance of Science in National Development: Building the Foundation of Viksit Bharat @2047." We are deeply thankful to our institution and academic colleagues for providing valuable guidance, encouragement, and a supportive environment for academic and research activities. Their constructive suggestions and intellectual support contributed significantly to the development of this study.

Financial support and Sponsorship

Abstract

This study asks whether AI infrastructure financing in 2023-2026 shows warning signs like telecom vendor financing before the 2001 collapse. It uses a qualitative case study to compare selected telecom and AI financing ties across six measures: financing size, accounting treatment, loan terms, credit risk, the gap between infrastructure and revenue, and market stress. The results partly support the telecom-AI comparison, especially in the size of commitments and the growing infrastructure-to-revenue gap. Still, the financing structures change, the opposing parties are stronger, and widespread defaults have not appeared. The telecom experience is best used as an early-warning framework, not as proof that an AI collapse must follow.

Keywords: *AI infrastructure, vendor financing, circular financing, telecom bubble, credit risk.*

Introduction

Between 1998 and 2001, the world's largest telecommunications equipment makers, including Lucent, Nortel, and Cisco, extended tens of billions of dollars in credit to the companies buying their switches, routers, and fibre-optic hardware. This practice, called vendor financing, let suppliers record revenue when equipment shipped, even though the risk of nonpayment stayed on their balance sheets as receivables. For a while, it made demand look explosive and self-sustaining. Then outside capital dried up in early 2001, and the arrangement fell apart. Customers defaulted. Receivables could not be collected. The equipment makers that had financed their own growth posted billions of dollars in losses. Lucent's revenue dropped 69 per cent from its 1999 peak and never recovered. The company no longer exists as an independent entity. A quarter-century later, a similar practice has appeared around the rapid buildout of artificial intelligence infrastructure. Nvidia, Microsoft, Amazon, and Google have together committed hundreds of billions of dollars to AI startups such as OpenAI, Anthropic, and CoreWeave. In several cases, the money provided by these major technology companies is tied, either directly or indirectly, to purchases of their own chips, cloud services, or infrastructure. By mid-2026, Nvidia alone had signed or begun discussions on more than $750 billion in such arrangements within a single week. That figure included a proposed guarantee of up to $250 billion for OpenAI's data-centre lease obligations. Financial commentators, credit-rating analysts, and even Nvidia's own CEO are now asking whether these deals amount to the same kind of self-referential financing that came before the telecom collapse, or whether that comparison is too simple to be useful. This debate raises a clear research question: Do the warning signs that came before the 2001 telecom equipment collapse, including weaker financing terms, growing bad-debt exposure, and stress in credit markets, also appear in the current AI infrastructure buildout? If they do, at what stage? This paper does not assume that history is repeating itself. Instead, it uses the telecom bubble as a historical benchmark and sets out observable indicators for judging today's AI financing arrangements.

Quick Response Code:

Website: https://bnir.us

The comparison covers the size and structure of the financing, its accounting treatment, changes in financing terms, credit and bad-debt risk, the gap between infrastructure spending and actual revenue, and wider market stress. The paper also examines key differences between the two periods. GPU computing capacity can be reused in ways that stranded fibre-optic capacity often could not. Nvidia's accounting relies on equity rather than loans, while Lucent recorded receivables on its books. These similarities and differences are treated as evidence, not as assumptions. The goal is not to claim that the AI infrastructure buildout will end in a telecom-style collapse. It is to assess whether the warning signs are appearing, whether they look like those seen before the telecom collapse, and whether the structural differences between the two cases change the type and severity of the risk.

Research Objectives

Primary Objective

To examine whether current AI vendor-financing arrangements (2023–2026) show warning signs like those seen before the collapse of telecom vendor financing (1998–2002), and to determine where the historical comparison fits and where it does not.

Supporting Objectives

To examine how telecom vendor financing worked and collapsed between 1998 and 2002, and to identify the main warning signs.

To assess the size, structure, and accounting treatment of current AI vendor-financing arrangements.

To compare the telecom and AI episodes by looking at financing structure, revenue recognition, credit exposure, and the risk of stranded assets.

To determine whether structural differences between the two episodes weaken the comparison with the telecom bubble.

To review market and financial stress indicators for evidence that the two episodes are similar or different.

To identify forward-looking indicators that could either support or disprove the historical comparison.

Research Questions

RQ1: What warning signs appeared before telecom vendor financing collapsed between 1998 and 2002, and how can they help compare that period with the AI industry today?

RQ2: How closely do current AI financing deals involving NVIDIA.OpenAI, NVIDIA. CoreWeave, Microsoft OpenAI, and Amazon/Google–Anthropic match the scale, structure, and accounting methods used in telecom?

RQ3: How do accounting rules, the reuse of assets, and the reasons for financing shape the comparison between AI and telecom vendor financing?

RQ4: Do current signals, including credit-default-swap spreads, the gap between AI infrastructure spending and revenue, and shifts in equity markets, point to warning signs like those seen in telecom? Or are they part of a normal market correction?

RQ5: What added financial data or disclosures would show whether the telecom–AI financing comparison grows stronger or weaker as the AI infrastructure market develops?

Literature Review

1. Historical Accounts of Telecom Vendor Financing

Moritz (2000) recorded widespread vendor financing by Lucent, Nortel, and Cisco, with commitments of about $7 billion, $3.1 billion, and $2.4 billion, respectively. This funding helped keep equipment purchases going as traditional sources of finance weakened. The study uses the size of vendor financing and the dependence between suppliers and customers as historical indicators, supporting RQ1. Using McKinsey estimates, Fink (2003) reported about $25.6 billion in vendor-financing exposure across nine major telecom suppliers by the end of 2000. Large losses followed as customers came under financial strain. This study treats financing exposure and later credit losses as measurable warning signs, supporting RQ1. Lazonick and March (2010) examined Lucent's customer-financing practices and its exposure to Winstar Wireless. Their work shows how credit risk shifted back to suppliers when customers failed. This study uses customer-financing exposure, counterparty risk, and realised losses as historical benchmarks, supporting RQ1. Lucent Technologies (2001-2002) reported major bad-debt charges and customer-financing provisions as its customers' financial conditions worsened. These realised losses provide evidence of financing stress, rather than relying only on announced commitments, supporting RQ1.

2. Accounting and Round-Tripping

Hanlon, Maydew and Thornock (2015) examined round-tripping through offshore investment structures. They showed how financial flows can pass through intermediaries before returning to the original market. This study uses circular financial flows to distinguish genuine financing from arrangements that may be circular, supporting RQ3. The wider accounting literature stresses the need to examine revenue recognition when sales and financing arrangements are closely tied. This study uses the difference between real demand and demand supported by financing to assess AI arrangements, supporting RQ2 and RQ3.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

3. Current AI Financing

Cahn (2023, 2024) found a growing gap between investment in AI infrastructure and revenue from A.I. applications. He described this first as the "AI's $200B Question" and later as the "AI's $600B Question." This study treats the infrastructure-to-revenue gap as a possible measure of whether demand can last, supporting RQ4.

Rasgon (2025), writing for Bernstein Research, questioned the size of Nvidia's proposed investment in OpenAI and the possibility of circularity. He also separated investment from direct product financing. This study uses the supplier-customer investment relationship and the circularity issue for comparison with telecom financing, supporting RQ2 and RQ3.

Reuters (2025) reported Nvidia's proposed investment of up to $100 billion in OpenAI, along with plans to expand AI computing capacity. This study uses the size and structure of the Nvidia-OpenAI relationship as evidence in the current comparison of AI financing, supporting RQ2.

Chanos (2025-2026) compared parts of AI financing with the earlier Lucent model. He argued that suppliers investing in customers who later buy their products may create circular-financing risks. This study treats that claim as a hypothesis to test, not as a settled conclusion, supporting RQ2 and RQ3.

4. Counter-Analyses

Friedman (2025) pointed to differences between GPUs and telecom fibre, especially their useful life, the pace of technical change, and the risk of becoming outdated. This study uses asset reuse, obsolescence, and the risk of stranded assets as comparison measures, supporting RQ3.

Johannsen (2026) compared vendor financing in the telecom era with current AI financing. The comparison covered financing size, supplier-customer ties, and credit exposure. This study includes those areas in its framework, supporting RQ1, RQ2, and RQ3.

Current AI analyses also separate financially strong hyperscalers from more exposed AI infrastructure providers. The groups differ in debt levels and customer concentration. This study adds counterparty strength, leverage, and concentration to the comparison, supporting RQ2 and RQ3.

Analysis and Discussion

The secondary analysis compares telecom vendor financing between 1998 and 2002 with AI infrastructure financing from 2023 to 2026. It looks at financing structure and scale, accounting treatment, counterparty risk, asset features, and signs of demand. The aim is not to claim that the two periods are the same. It is to see whether warning signs that came before the telecom collapse can also be found in the current AI market.

1. Financing Structure and Scale

During the telecom period, equipment suppliers often financed their customers' purchases directly. Lucent, Nortel, and Cisco extended large amounts of credit to telecom carriers. That tied supplier revenue growth to the customer's ability to secure financing. Similar supplier-customer ties are now appearing in AI, though the arrangements differ. NVIDIA, for example, announced plans to invest up to $100 billion in OpenAI alongside a planned deployment of at least 10 gigawatts of NVIDIA systems. CoreWeave also disclosed a $2 billion NVIDIA equity investment in January 2026. NVIDIA GPUs made up 17% of CoreWeave's supplier purchases in 2025. The evidence shows a structural link with telecom. Suppliers are increasingly providing capital or other financial support to companies that use their technology. Still, these AI deals are not all standard vendor loans. Many involve equity investments, strategic partnerships, cloud commitments, or infrastructure financing. The similarity is therefore clearer in the economic relationship than in the legal form of the financing.

2. Accounting Treatment

The accounting comparison shows a major difference between the two periods. Telecom vendor financing often left equipment makers with direct credit exposure. When customers' finances worsened, suppliers eventually recorded bad-debt provisions and losses.

Many current AI deals, by contrast, are set up as equity investments or strategic commitments. NVIDIA's announced arrangement with OpenAI, for example, is an intended investment tied to the deployment of NVIDIA systems. It is not simply a conventional loan.

That difference weakens the strongest version of the telecom comparison. A supplier's equity investment does not automatically produce the same revenue recognition pattern as a supplier loan. Financial circularity, on its own, should not be read as accounting manipulation or as proof of artificial revenue. The key issue is whether the financing creates demand that depends on the supplier and shifts major risk back to that supplier.

3. Supplier-Customer Circularity

The accounting difference does not remove an important similarity in the economic relationship. NVIDIA's investment in OpenAI is tied to a large planned deployment of NVIDIA systems. Amazon's investment in Anthropic comes with Anthropic's commitment to use AWS infrastructure and Amazon's Trainium and Inferentia technologies.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Amazon's 2024 investment brought its total investment in Anthropic to $4 billion, and Anthropic became AWS's main cloud and training partner.

Microsoft's relationship with OpenAI has a similar mix of investment, infrastructure capacity, revenue sharing, and dependence on Azure. Microsoft said that OpenAI's API remains closely integrated with Azure, while the two companies also share revenue under their arrangements.

These relationships show how closely capital, demand for infrastructure, and technology supply are now connected. The pattern shows the economic logic of telecom vendor financing, but the recent deals combine equity, cloud services, technology partnerships, and contract commitments more broadly.

4. Infrastructure-to-Revenue Gap

Another warning sign is the link between infrastructure spending and actual revenue. Cahn (2024) estimated that the gap between AI infrastructure investment and AI application revenue had grown to about $600 billion. His earlier analysis put the gap at $125 billion.

That figure may be a warning because spending on infrastructure is running far ahead of proven end-user revenue on a very large scale. The gap alone does not prove that a bubble exists. New technology can need heavy infrastructure costs before revenue catches up. The tension grows if the gap keeps widening while AI revenue, capacity use, or customer demand fails to keep pace.

5. Counterparty and Credit Risk

The AI market also differs from telecom in the financial strength of its participants. Large technology companies such as Microsoft, Amazon, and Alphabet have broad businesses and strong cash flow. That gives them more financial room than many telecom carriers had, since those carriers relied heavily on continued access to capital markets.

Risk may still be higher among heavily indebted AI infrastructure providers. CoreWeave, for example, reported raising more than $20 billion in debt and equity capital during 2026 to expand its AI cloud platform. This shows that counterparty risk varies across the AI market. It may be concentrated among infrastructure providers with high capital needs and a strong dependence on continued AI demand.

6. Asset-Stranding Risk

The underlying assets produce a mixed comparison. Telecom infrastructure suffered when excess network capacity went unused after demand forecasts collapsed. AI infrastructure may have more alternative uses because computing capacity can support different customers and workloads. GPUs and AI systems, however, also face fast technological change and depreciation. Data-centre infrastructure requires long-lived investments, and those assets may be hard to repurpose if demand or technology shifts.

The evidence does not support treating AI assets as fully reusable or as the same as telecom fibre. Stranding risk exists, but it takes a different form. It must be judged through capacity use, technological obsolescence, and the potential to resell or redeploy the assets.

7. Overall Comparative Assessment

The secondary analysis finds several important similarities between the AI and telecom episodes. Both involve rapid infrastructure growth, financial ties between suppliers and customers, large capital needs, demand supported by financing, and questions about whether future revenue will justify the investment.

The differences matter just as much. Current AI financing often uses equity rather than direct customer loans. Its counterparties include financially strong technology companies, and AI infrastructure may have more possible uses. These points weaken a simple one-to-one comparison with the telecom collapse.

Overall, the evidence offers partial support for the telecom analogy, not proof of it. The strongest similarity is not that AI financing copies the exact accounting structure of telecom vendor financing. It is that technology suppliers are using their financial strength more often to support the companies that buy or rely on their technology. The comparison becomes stronger if financing commitments keep growing faster than underlying revenue, and if defaults, lower utilisation, financing losses, or rising credit stress begin to appear.

The telecom analogy should therefore be treated as an early-warning framework that can be tested, not as a forecast of an unavoidable AI collapse. Future disclosures on financing commitments, counterparty exposure, capacity use, debt payments, investment losses, and revenue growth will help show whether the current AI buildout moves toward or away from the telecom path.

Research Methodology

Research Approach: The paper uses a qualitative and comparative case study based on secondary data. It compares telecom vendor financing during 1998-2002 with AI infrastructure financing during 2023-2026.

Data Sources: Data come from SEC filings, annual reports, company disclosures, financial press, sell-side research, industry reports, and relevant academic literature.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Case Selection:
Telecom: Lucent, Nortel, and Cisco.
AI: Nvidia-OpenAI, Nvidia-CoreWeave, Microsoft-OpenAI, and Amazon/Google-Anthropic.
These cases were chosen because of the size and form of their financing relationships, along with the financial strength of the counterparties.
Comparative Framework: The telecom experience is the historical benchmark. Six indicators are compared across the two periods:
Financing scale
Accounting treatment
Financing terms
Credit and bad-debt signals
Infrastructure-to-revenue gap
Market stress signals
Data Analysis: Evidence from the selected cases is compared to find similarities, differences, and structural gaps between telecom and AI vendor financing.
Interpretation: The findings show whether the warning signs seen in telecom are present, partly present, absent, or not yet visible in the current AI buildout.

Limitations
Data asymmetry: The telecom case offers historical data on defaults, bad-debt provisions, and financing losses. The AI case is still developing, so some of the same outcomes cannot yet be observed.
Secondary data dependence: The paper depends mainly on company filings, financial reports, financial journalism, industry research, and academic literature. Current AI financing data may change as new disclosures appear.
Limited comparability: The financing structures in the two periods are not the same. AI arrangements may include equity investments, cloud commitments, guarantees, or other forms, while telecom vendor financing was more directly credit-based.
Interpretation of motivations: The reasons companies provide financing, such as strategic confidence or the need to support demand, cannot always be checked directly. These claims are therefore handled with care in the analysis.
Case-study scope: The study covers selected telecom and AI companies. It does not aim to make statistical claims or predict an AI market collapse. Its purpose is to compare historical warning signs in a structured way.
Time sensitivity: AI financing arrangements and market measures are changing quickly. The findings reflect the public evidence available during the study period and may change as new financial disclosures and market data appear.

Findings
The comparative analysis reviews the six indicators set out in the methodology. It asks whether warning signs linked to telecom vendor financing can be seen in the current AI infrastructure buildout. The results show clear similarities, along with major structural differences.
1. Commitment Scale - Present, Amplified
Telecom vendor financing reached about $25.6 billion across nine major suppliers by the end of 2000. Current AI financing and investment commitments are much larger in absolute terms. Nvidia alone announced more than $540 billion in AI-related deals in 2026, with more arrangements still under discussion.
Size alone does not show that these AI arrangements are the same as telecom vendor loans.
Finding: The scale indicator is present and amplified, but the financing structures are different.
2. Accounting Mechanism - Absent in Original Form
Telecom vendor financing gave equipment suppliers direct credit exposure. When customers failed to repay, suppliers could record bad-debt provisions and losses. Current AI arrangements are more varied. They include equity investments, cloud commitments, guarantees, and strategic partnerships. So far, these structures do not recreate the same revenue-recognition and credit-loss process linked to telecom vendor financing.
Finding: The original telecom accounting mechanism is absent. This is a major structural difference.
3. Financing-Term Deterioration - Not Yet Observable
One major warning sign in telecom was the continued expansion of financing even as customer conditions worsened. Comparable evidence that AI suppliers are systematically offering more aggressive financing terms because customers are under financial pressure has not been made public. Larger AI commitments alone do not show that financing quality has declined.
Finding: This indicator cannot yet be observed, but it remains an important forward-looking measure.
4. Credit and Bad-Debt Signals - Partially Present
The telecom collapse eventually brought major customer defaults, bad-debt provisions, and actual losses on financing. In AI, credit pressure appears to be centred on highly leveraged infrastructure providers rather than spread across the whole sector. Public evidence of sector-wide financing losses on the scale seen in telecom is still unavailable.
Finding: The indicator is partly present. Credit stress can be seen in parts of AI infrastructure, but there is no telecom-level system-wide decline.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

5. Infrastructure to Revenue Gap - Present, Widening

The relationship between infrastructure spending and revenue offers another useful comparison. Cahn's estimates of the yearly gap between AI infrastructure needs and AI application revenue rose from about $125 billion in 2023 to $600 billion in 2024 and about $840 billion in 2025. His later 2026 analysis put the gap at roughly $1.5 trillion.

This widening gap indicates that infrastructure spending is still running far ahead of actual application revenue. The estimate is an analytical measure, not audited industry data. It therefore points to questions about demand, rather than proving that a bubble or collapse must follow.

Finding: The indicator is present and widening.

6. Market Stress - Partially Present

The AI sector has faced serious market stress, including a sharp fall in AI and semiconductor valuations during 2026. Still, current evidence does not show a financing-market shutdown like the one seen in telecom. In that case, worsening market conditions were followed by limited access to financing and widespread customer failures.

Finding: The indicator is partly present. Market stress is clear, but a wider collapse in access to financing has not been established.

7. Summary of Findings

Indicator	**Finding**
Financing Scale	**Present – Amplified**
Accounting Mechanism	**Absent in Original Form**
Financing-Term Deterioration	**Not Yet Observable**
Credit & Bad-Debt Signals	**Partially Present – Concentrated**
Infrastructure to Revenue Gap	**Present – Widening**
Market Stress	**Partially Present**

Overall Finding

The evidence gives partial support to the telecom-AI comparison. The clearest similarities are the size of the commitments and the growing gap between infrastructure spending and actual revenue. Credit and market stress show some overlap as well. The original telecom accounting mechanism, however, is not repeated in today's AI arrangements, and financing terms have not yet shown clear deterioration. The findings suggest that the AI infrastructure buildout shares several early warning signs with the telecom episode. It does not currently repeat the full telecom financing model. The comparison is useful for watching risk, but the available evidence is not enough to conclude that AI is heading toward the same kind of collapse.

Conclusion

This study asked whether the warning signs linked to the collapse of telecom vendor financing between 1998 and 2002 can be seen in the AI infrastructure buildout from 2023 through 2026. Using a qualitative case comparison and secondary data, the analysis reviewed six indicators: commitment scale, accounting mechanism, direction of financing terms, credit and bad-debt signals, the infrastructure-to-revenue gap, and market stress. The findings offer partial support for the telecom-AI comparison. The strongest similarities involve the size of commitments and the widening gap between infrastructure spending and realized revenue. Together, these signs raise questions about whether underlying demand can support the current pace of AI expansion. Credit and market stress also show some similarities, though the available evidence is more limited and less severe than it was during the telecom collapse. There are also important structural differences. Current AI arrangements often include equity investments, cloud commitments, guarantees, and strategic partnerships instead of the supplier loans that defined telecom vendor financing. That changes both the accounting effects and the type of exposure suppliers carry. AI computing infrastructure may also have more possible uses than the excess fiber capacity left after the telecom boom. These differences do not remove financial risk, but they may affect how losses appear.

Some of the most useful telecom warning signs still cannot be seen clearly in the AI case. There is not enough evidence that financing terms are becoming more aggressive as customers come under pressure. There is also no clear evidence of financing losses across the sector. For now, that limits any claim that AI has reached the same stage as telecom. Overall, the AI infrastructure buildout shares several early warning signs with telecom vendor financing. It does not currently repeat the same financing structure or collapse process. The telecom comparison can help track risk, but it should not be treated as proof that an AI collapse is certain. As AI financing develops, new information about financing terms, counterparty exposure, credit problems, defaults, and actual losses will matter. That evidence will show whether the similarities grow stronger or the structural differences remain.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

For now, the cautious view is the right one: the comparison is neither confirmed nor rejected, and its value will depend on how the indicators that cannot yet be observed develop over time.

Recommendations

For Investors and Analysts

Watch for changes in financing terms, since they may be an early sign of rising counterparty risk.

Track credit spreads and CDS movements along with equity-market performance.

Separate financially strong hyperscalers from highly leveraged AI infrastructure providers when judging risk.

Treat equity-based financing as a different type of exposure. It does not remove risk.

For Regulators

Ask for clearer disclosure of AI-related financing commitments, investments, guarantees, and counterparty exposure.

Separate announced commitments from money that has actually been funded.

Review the accounting treatment of deals in which financing and technology purchases are closely linked.

For Future Research

Apply the six-indicator framework again as more AI financing data becomes available.

Broaden credit-risk research across more AI infrastructure companies.

Study actual defaults and realised losses as current arrangements mature.

Examine whether financing terms change when counterparties come under financial stress.

Acknowledgement

I would like to express my sincere gratitude to all those who contributed to the successful completion of this research paper, "The Circular Loop Revisited: Vendor Financing in the Telecom Bubble and the AI Infrastructure Buildout." I am deeply thankful to my teachers, mentors, and academic guides for their valuable guidance, constructive suggestions, and continuous encouragement throughout the research process. Their insights helped me develop a clearer understanding of vendor financing, circular financing, credit risk, and the comparative relationship between the telecom bubble and the current AI infrastructure buildout.

Abstract

India's aspiration for Viksit Bharat by 2047 hinges on cultivating a future-oriented, technologically proficient workforce, a target that the National Education Policy (NEP-2020) aims to promote through an extensive directive for digital skill development across all sectors of higher education. This document contends that the digital skilling terminology of NEP-2020 is regarded, both in policy and governmental oversight frameworks, as a singular, uniform directive relevant to all fields. This research employs a comparative case-study framework situated in Coimbatore district, Tamil Nadu, to examine the implementation of the mandate in a technical discipline (Master of Computer Applications, MCA), where digital proficiency is integral to the curriculum, versus non-technical disciplines (Commerce and Arts), where digital skills serve as an ancillary, supplementary competency. Utilizing the provisions of NEP-2020, national implementation data from the All India Survey on Higher Education (AISHE) 2023-24, and primary survey data from 22 MCA students, 2 MCA faculty, 28 Commerce/Arts students, and 3 Commerce/Arts faculty/BOS members in colleges of Coimbatore district, the study establishes a conceptual differentiation between "foundational" and "add-on" digital skills, revealing that each produces a distinct employability gap: a currency gap in the technical field, where 63.6% of MCA students had to acquire a crucial skill entirely outside their curriculum despite moderately high ratings for curriculum relevance, and an access-and-integration gap in the non-technical fields, where only 35.7% of Commerce/Arts students believed digital skills were effectively incorporated into their courses, with none of the surveyed Commerce/Arts faculty indicating a Board of Studies syllabus that included compulsory digital-skill courses. The research culminates in tailored suggestions for curriculum development and Board of Studies initiatives, contending that a standardized national skilling directive, lacking disciplinary adjustment, may inadequately serve both technical and non-technical students in various respects.

Keywords: *NEP-2020, Digital Skilling, Employability, MCA, Commerce, Arts, Curriculum Comparison, Board of Studies, Viksit Bharat 2047*

Introduction

The National Education Policy 2020 (NEP-2020) signifies a notable transformation in the Indian higher education system's engagement with technology and skill enhancement, framing digital proficiency as a universal necessity for all students rather than a niche, discipline-oriented issue. This aspiration aligns with the broader national objective of Viksit Bharat @2047, which positions a digitally empowered, innovation-oriented populace as pivotal to India's transformation into a developed nation by the 100th anniversary of its independence.

OPEN ACCESS

Nonetheless, the pragmatic interpretation of "digital skilling" is improbable to be uniform across various fields. For a scholar undertaking a Master of Computer Applications (MCA), digital and computational proficiency constitutes the fundamental focus of the program; the pertinent inquiry is whether this expertise stays relevant in a rapidly evolving sector. For a student enrolled in a Bachelor of Commerce (B.Com.) or Bachelor of Arts (B.A.), digital proficiency is generally an ancillary skill incorporated into a non-technical foundational curriculum via Skill Enhancement Courses or comparable offerings; the pertinent inquiry is whether this proficiency is effectively integrated and readily available. Notwithstanding this structural divergence, national policy terminology and oversight frameworks like the All India Survey on Higher Education (AISHE) consistently monitor indicators related to digital skills across all institutions and fields, failing to differentiate between these two inherently distinct forms of digital skill development. This study examines the differentiation directly, integrating national policy and implementation evidence with primary survey data gathered from MCA and Commerce/Arts students and faculty in Coimbatore district, Tamil Nadu, a prominent higher-education center in a state that, as per AISHE 2023-24 data, boasts one of the highest Gross Enrollment Ratios in the nation.

Policy Background and Literature Review

1. NEP-2020's Digital Skilling Provisions

NEP-2020 directly tackles digital skill development in its section on technology utilization and integration, proposing the National Educational Technology Forum (NETF) as a central hub for technology application in learning, evaluation, planning, and management within both school and higher education. The policy clearly acknowledges that disruptive technologies, such as artificial intelligence, will make certain current jobs obsolete, and thus instructs Higher Education Institutions (HEIs) to proactively engage in researching these technologies and creating educational resources and training programs focused on job preparedness. Simultaneously, NEP-2020 implements structural reforms pertinent to the delivery of digital skills, such as the Academic Bank of Credits (ABC), a four-year undergraduate program framework featuring multiple entry and exit options, and Skill Enhancement Courses designed to cultivate practical, applied competencies in conjunction with a student's primary discipline.

2. National Implementation Evidence (AISHE 2023-24)

The Ministry of Education, Government of India, released the All India Survey on Higher Education (AISHE) 2023-24, which gathered data on NEP implementation from universities across the nation for the inaugural time. Numerous statistics presented pertain directly to the skilling and employability aspect of NEP-2020, such that merely 41% of universities have an Internship Cell, only 7% own an Apprenticeship Cell, and just 45% provide Multidisciplinary Degree Programs. AISHE presents these statistics solely at the national level, lacking breakdowns by discipline, state, or district, thus they cannot independently reveal whether this implementation disparity impacts technical and non-technical fields uniformly, a discrepancy that the core survey data of this article explicitly examines. This structural disparity aligns with the broader Indian discourse on skill-oriented education as per NEP-2020. Current research indicates that Skill Enhancement and Ability Enhancement Courses have proliferated swiftly within undergraduate programs, and that revisions to the Learning Outcomes-based Curriculum Framework (LOCF) for Commerce and related disciplines have intentionally increased the proportion of skill-focused electives. Concurrent investigations into the employability of B.Com., MBA, and computer science graduates consistently reveal a chronic disparity between curriculum offerings and employer demands [1][2][10][17], indicating that merely increasing the quantity of skill courses on paper does not ensure that graduates perceive these courses as sufficient preparation for the workforce.

3. Conceptual Framework: Foundational versus Add-on Digital Skilling

To structure the comparison at the centre of this paper, two categories of digital skilling are proposed. Foundational digital skilling describes disciplines such as MCA, where digital and computational competency constitutes the core subject matter of the degree itself; here, the primary employability risk is a currency gap, the curriculum's ability to keep pace with rapidly evolving industry tools, platforms, and practices, rather than the presence or absence of digital training itself [2][17]. Add-on digital skilling describes disciplines such as Commerce and Arts, where digital competency is a supplementary layer attached to a non-technical core curriculum, typically delivered through Skill Enhancement Courses; here, the primary employability risk is an access-and-integration gap, whether meaningful digital skill training exists at all within the course

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

structure, and how well it is woven into the discipline rather than treated as a separate, low-priority component [1][9][10].

Methodology

This study adopts a comparative case-study design set within Coimbatore district, Tamil Nadu, comparing one technical stream (MCA) against non-technical streams (Commerce and Arts) at the postgraduate and undergraduate level respectively. Data are drawn from three sources. First, documentary analysis of NEP-2020's technology-integration and skilling provisions, and of AISHE 2023-24's NEP-implementation indicators, establishes the national policy and implementation backdrop (reported in Section 2). Second, primary structured survey data were collected from students in the MCA and Commerce/Arts streams, using parallel questionnaires designed so that responses across streams could be directly compared across shared dimensions: the nature of digital skill within the curriculum, the specific employability gap experienced (currency versus access), awareness of NEP-2020-linked provisions, and pathways used for upskilling. In total, 22 MCA students and 28 Commerce/Arts students responded. Third, a short structured survey was administered to faculty and Board of Studies members in each department (2 MCA faculty; 3 Commerce/Arts faculty/BOS members), covering curriculum revision frequency, industry linkage, and perceptions of whether the digital skilling mandate applies differently across technical and non-technical streams. The full questionnaires used for student and faculty data collection are provided in Annexure A. Student and faculty responses were analysed descriptively and comparatively across the two stream categories (technical versus non-technical), using the shared question structure to construct a direct comparison Table 1 (Section 5).

Findings

1. Nature of Digital Skill in the Curriculum

Among MCA students, 63.6% rated their curriculum's reflection of current industry tools and technologies at 4 or above on a 5-point scale (mean = 3.59/5), and the majority (50%) reported that 50-75% of their overall coursework was directly technical/digital in nature, with a further 27.3% reporting 75-100%. This confirms that for MCA students, digital competency is genuinely foundational to the curriculum, consistent with the conceptual framework in Section 2.3. Among Commerce/Arts students, only 35.7% described digital skills as "well integrated" into their course, while 50% described the integration as "somewhat an add-on" and a further 14.3% as "completely an add-on." The largest share of Commerce/Arts students (67.7%) reported that 25% or less of their total coursework related to digital skills. This directly confirms the paper's add-on characterisation of digital skilling in non-technical streams.

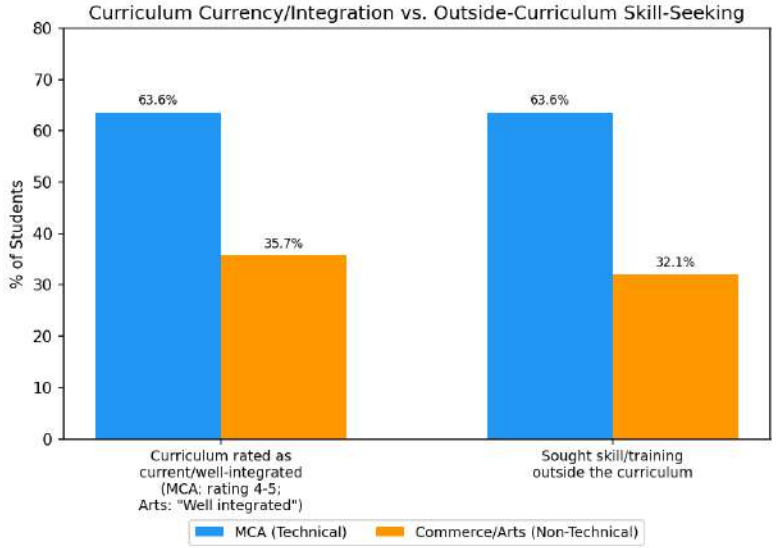

Figure 1: Curriculum currency/integration ratings and outside-curriculum skill-seeking, MCA versus Commerce/Arts.

2. The Employability Gap: Currency versus Access

The data support the paper's central distinction between a currency gap for MCA and an access-and-integration gap for Commerce/Arts. Despite MCA students rating their curriculum's currency moderately highly (mean 3.59/5), a substantial 63.6% still reported having to learn a critical skill entirely outside their curriculum to become job-ready, most commonly citing AI tools, full-stack development, and cloud/DevOps technologies (Docker, Kubernetes) as skills recruiters expected but the curriculum did not sufficiently cover. This

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

pattern, a reasonably current curriculum that nonetheless cannot keep pace with a fast-moving industry, is the signature of a currency gap rather than an access gap. Among Commerce/Arts students, 32.1% had sought digital-skill training outside college, a somewhat lower rate than MCA, but the reasons cited differ meaningfully in character: the most common reasons were wanting an extra competitive advantage (11 respondents) and the curriculum being insufficient or not covering the skill at all (19 respondents combined), pointing toward a structural access gap rather than a currency-keeping-pace problem. This is reinforced by the finding that 0% of surveyed Commerce/Arts faculty/BOS members reported that their current Board of Studies syllabus includes mandatory digital/computer skill papers, despite all three unanimously supporting the addition of a mandatory, industry-aligned digital-skills module.

3. Curriculum Revision Frequency and Institutional Responsiveness

A striking asymmetry emerged in faculty-reported curriculum revision frequency. Both surveyed MCA faculty members reported that the syllabus is formally revised every semester, and both confirmed active industry MoU or certification partnerships (with iExemplar named as a partner). By contrast, none of the three Commerce/Arts faculty/BOS respondents reported mandatory digital-skill papers in the current syllabus, and all three identified the biggest barrier to strengthening digital-skill integration as uncertainty over how to proceed ("No idea" was the modal response), suggesting not resistance but a genuine institutional capacity or guidance gap at the Board of Studies level for non-technical streams.

4. Awareness of NEP-2020 Provisions

Awareness of NEP-2020-driven changes was moderate in both streams but followed a different pattern. Among MCA students, 45.5% reported being aware of NEP-2020-driven changes in their course, while an equal 45.5% were "not sure," indicating awareness exists but is not consistently reinforced. Among Commerce/Arts students, awareness was somewhat higher at 60.7% aware, 28.6% not aware, and 10.7% not sure.

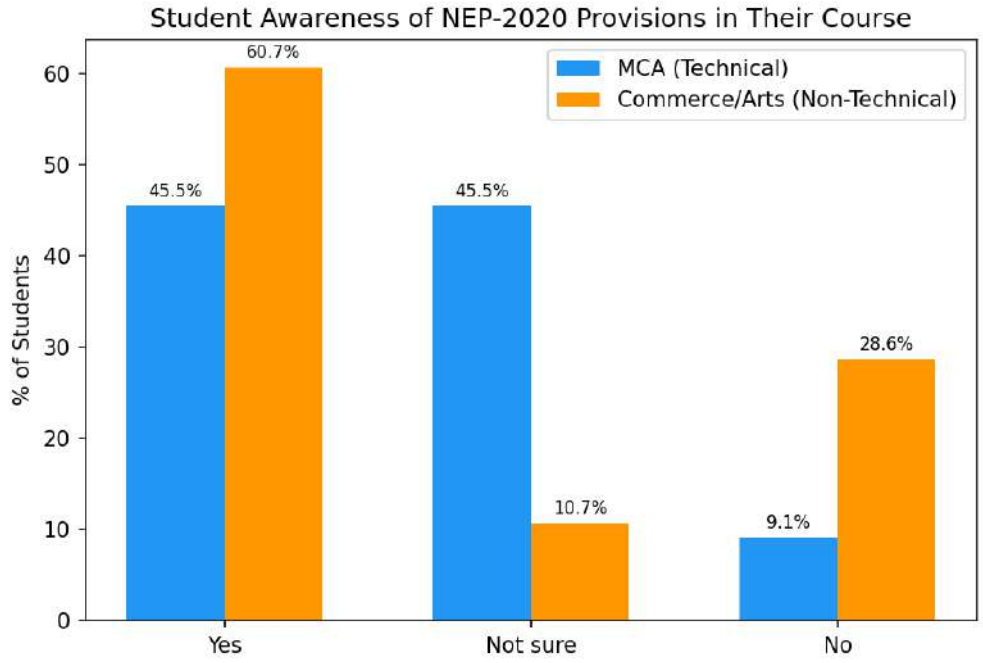

Figure 2: Student awareness of NEP-2020 provisions in their course, MCA versus Commerce/Arts.

5. Upskilling Pathways

MCA students relied most heavily on online certifications (68.2% of respondents), internships (54.5%), self-study (50.0%), and YouTube/online learning platforms (45.5%). Commerce/Arts students relied most on college-organised workshops (35.7%), self-study and online certifications (32.1% each), and notably showed higher reliance on coaching institutes in Coimbatore (21.4%) than MCA students (13.6%), consistent with a population that has less structured digital-skill support built into its own curriculum and therefore turns more often to external, local training providers.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

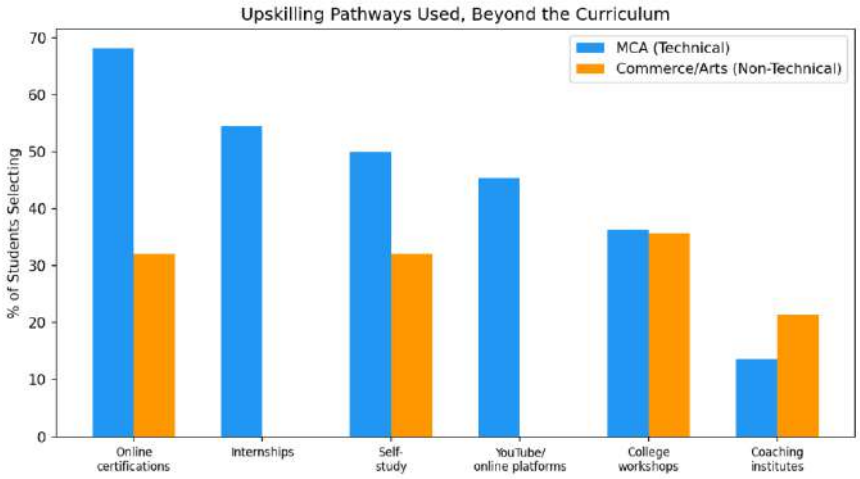

Figure 3: Upskilling pathways used beyond the curriculum, MCA versus Commerce/Arts (% of respective student sample selecting each option; multiple selections permitted).

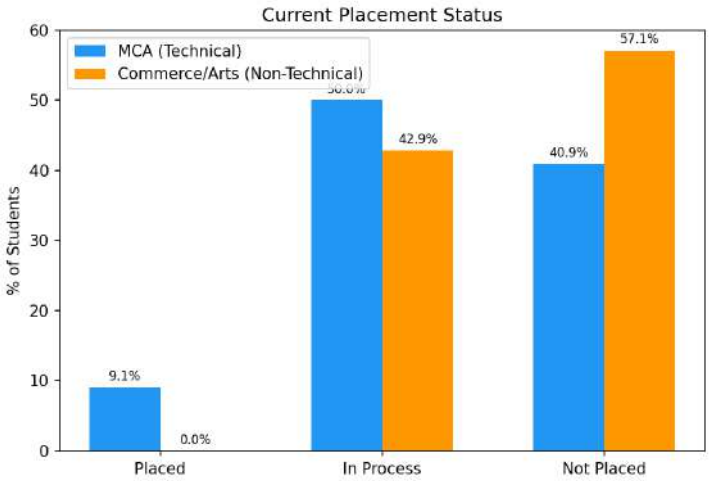
6. Placement Outcomes

At the time of the survey, 9.1% of MCA students reported being placed, 50.0% in process, and 40.9% not yet placed; no Commerce/Arts respondents reported being placed, with 42.9% in process and 57.1% not placed (the higher not-placed share is consistent with a larger proportion of early-year Commerce/Arts respondents in the sample). Among Commerce/Arts students who had applied for jobs, 60.7% reported that digital skills came up as either a major (28.6%) or minor (32.1%) factor in the application or interview process, underscoring that digital competency matters for employability in this stream even though the curriculum does not yet formally prioritise it.

Figure 4: Current placement status, MCA versus Commerce/Arts.



7. Comparative Summary Table

Table 1: Comparative findings, MCA versus Commerce/Arts, based on primary survey data (n=22 MCA students, 2 MCA faculty; n=28 Commerce/Arts students, 3 Commerce/Arts faculty/BOS members).

Dimension	MCA (Technical)	Commerce/Arts (Non-Technical)
Nature of digital skill in curriculum	Foundational; 63.6% rate curriculum currency 4-5/5	Add-on; only 35.7% call it "well integrated"
Primary employability gap identified	Currency gap: 63.6% learned a critical skill outside curriculum despite moderate currency rating	Access/integration gap: 0% of BOS syllabi have mandatory digital papers
Curriculum revision frequency (faculty-reported)	Every semester (100% of faculty)	No mandatory digital component to revise (0%)

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Student awareness of NEP-2020 provisions	45.5% aware, 45.5% not sure	60.7% aware, 28.6% not aware
Primary upskilling pathway used	Online certifications (68.2%)	College workshops (35.7%)
Faculty/BOS responsiveness to skill gaps	Active industry MoUs confirmed (100% of faculty)	100% support mandatory module, but none yet implemented

Discussion

The primary survey findings substantiate the structural concern raised in Sections 2 and 3: national monitoring frameworks such as AISHE track digital-skilling-adjacent indicators as single, undifferentiated percentages, applied uniformly regardless of whether an institution's dominant discipline is technical or non-technical in nature, and this study's Coimbatore-level data show these two disciplines are, in practice, experiencing entirely different problems under the same policy label. For MCA, the data show low measured "gaps" in the sense that curriculum currency is rated reasonably well and faculty report frequent, active revision cycles, yet a majority of students still had to acquire critical, recruiter-expected skills, particularly around AI tools and cloud/DevOps technologies, entirely outside the curriculum. This is consistent with the currency-gap hypothesis: even a well-intentioned, frequently revised technical curriculum in a fast-moving field such as computing struggles to keep pace with the specific tools employers expect at any given moment. For Commerce/Arts, the data show a more structural pattern: a majority of students see digital skills as an add-on rather than integrated, no surveyed faculty/BOS member reported mandatory digital papers in the current syllabus, yet all surveyed faculty support adding one, and a majority of job-seeking students report that digital skills already matter for employability in practice. This is not a currency problem, it is an access and institutional-prioritisation problem, where the primary barrier is not disagreement about the need but uncertainty about how to act on it, as reflected in the faculty's own "No idea" responses regarding the biggest barrier to progress. Together, these findings support the paper's central argument that disciplinary calibration, not just aggregate monitoring, is necessary for NEP-2020's digital skilling mandate to translate into genuine employability gains.

Policy and Curriculum Recommendations

1. For Technical Streams (e.g., MCA)

- Institute a formal, time-bound curriculum review cycle explicitly tied to tracked industry-tool and platform changes (e.g., AI tools, cloud/DevOps platforms), building on the already-active semester-wise revision cycle and industry MoU (iExemplar) confirmed by faculty in this study.
- Formalise partnerships with additional industry certification providers as credit-bearing components under the Academic Bank of Credits framework, given that 68.2% of students already independently pursue online certifications.

2. For Non-Technical Streams (Commerce/Arts)

- Mandate a minimum credit-bearing digital skills component within the Board of Studies syllabus structure, directly responding to the unanimous faculty support for such a module found in this study and the current absence of any mandatory digital paper.
- Provide Board of Studies members with concrete implementation guidance and templates, given that the primary barrier identified by faculty was uncertainty about how to proceed rather than resistance to the idea.
- Actively publicise and formally link students to existing government upskilling infrastructure (Skill India, PMKVY, NSDC-affiliated centres, and local Coimbatore providers), given that only 38.7% of surveyed students reported knowing where to access government-supported digital upskilling programmes in Coimbatore.

3. For Policy and Monitoring Frameworks

- Recommend that national monitoring instruments such as AISHE consider discipline-disaggregated reporting of key NEP-implementation indicators, to avoid masking disciplinary imbalances behind uniform institutional averages, as this study's Coimbatore-level, discipline-specific data demonstrate such disaggregation is both feasible and revealing.

Conclusion

This paper has argued and, through primary survey evidence from Coimbatore district, substantiated that NEP-2020's digital skilling mandate, while framed as a uniform policy applicable across all higher education streams, functions in structurally different ways depending on whether digital competency is foundational to a discipline, as in MCA, or supplementary to it, as in Commerce and Arts. MCA students face a currency gap, needing to independently acquire fast-moving industry skills despite a reasonably current, frequently revised curriculum, while Commerce/Arts students and faculty face an access-and-integration gap, with unanimous faculty support for a mandatory digital-skills module that has not yet been implemented.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

The stream-differentiated recommendations offered, spanning curriculum revision cycles, Board of Studies action, and national monitoring design, are intended as a practical contribution toward ensuring that India's digital skilling agenda serves technical and non-technical learners equally well, in support of the broader goal of a genuinely future-ready workforce under Viksit Bharat @2047.

Acknowledgement

The authors would like to express their sincere gratitude to all those who contributed to the successful completion of this research study titled "One Policy, Two Realities: A Comparative Study of NEP-2020's Digital Skilling Mandate Across Technical (MCA) and Non-Technical (Commerce/Arts) Disciplines from Colleges in Coimbatore District." We are deeply thankful to the management and academic authorities of Hindusthan College of Engineering and Technology, Coimbatore, for providing the necessary academic environment and support for undertaking this study. We also express our sincere appreciation to the faculty members and Board of Studies members who shared their valuable perspectives regarding curriculum revision, industry linkages, digital-skilling requirements, and the implementation of NEP-2020.

Financial support and Sponsorship

Abstract

In the twenty-first century, the agriculture industry faces several critical challenges, including the need to enhance crop immunity, reduce the dependence on chemical fertilizers, synthetic pesticides, and herbicides, and most importantly, improve overall crop yield and quality. Onion is one of the significant crops that is widely cultivated in Maharashtra. Maharashtra produces around 8.6 million tons of onions annually. Arbuscular mycorrhizal fungi (AMF) are among the main components of the soil microbiota, with the potential not only to assist in the establishment of the host plant but also to improve overall plant growth. In the present study, we have isolated and identified the diverse species of arbuscular mycorrhizal fungi associated with different villages in the Parner tehsil located. Rhizosphere soil samples collected from four different sites at the study location were processed for isolation of arbuscular mycorrhizal fungi, which were then identified using microscopic examination of morphological features. The AM fungi observed in the soil samples included eight species of Glomus, three species of Acaulospora, and one species of Scutellospora. The most common and dominant mycorrhizal fungi Glomus fasciculatum and Glomus geosporum. The present study was conducted during the period from October 2025 to June 2026. The winter season is characterized by moderate daytime temperatures, distinctly cooler nights, and low humidity.

Keywords: *Arbuscular Mycorrhizal Fungi, Spore Diversity, Soil Collection, and Identification, etc.*

Introduction:

Mycorrhiza is an eco-friendly biofertilizer that helps overcome fertilizer shortages, improve nutrient uptake, and enhance onion productivity. Mycorrhiza is a mutually beneficial association between fungi and plant roots that improves nutrient uptake, water absorption, and plant growth. It plays a significant role in sustainable agriculture by enhancing soil fertility, increasing crop productivity, and improving tolerance to environmental stresses such as drought and salinity. **Dhiman M. *et.al.* (2022); George N. P. & Ray J. G. (2023); Kuyper, T. W., and Jansa, J. (2023).** Onion is an important bulb crop in the family Amaryllidaceae and has gained prominence as a cash crop in recent years due to its high export potential. It is grown worldwide for its food and culinary value. Leading onion-producing countries include China, India, the USA, Pakistan, Turkey, Russia, Iran, Brazil, Mexico, and Spain. **Food and Agriculture Organization of the United Nations. (2025).** Arbuscular mycorrhizas are symbiotic relationships between plant roots and soil fungi belonging to the phylum *Glomeromycota*. AMF are known to benefit plant establishment by increasing resistance to environmental stresses, enhancing plant nutrient acquisition, water relations, disease resistance, and improving soil quality.

Sunita Chahar (2017). The study of mycorrhizal associations began in the nineteenth century, and the term "mycorrhiza" was first coined by Frank in 1885 to describe the mutualistic relationship between fungi and plant roots. **Koide R. T. and Mosse B. (2004).** Seedlings treated with AM fungi are more resistant to root pathogens and show resilience in degraded lands with low fertility. **Seema Dev *et. al.* (2017).** Owing to its nutritional and therapeutic properties, onion is increasingly considered a functional food with substantial potential to promote human health and prevent chronic diseases. **Griffiths G. *et al.* (2002); Corzo-Martínez *et al.* (2007); Marrelli M. *et al.* (2019); Reilly Ren *et al.* (2021).** Farmers face challenges in increasing productivity and maximizing onion cultivation within limited timeframes. According to a recent report by The Economic Times, approximately 1.75 million tons of onions remained unharvested in Maharashtra after the crushing season concluded. **Shevalkar M. D. (2022).** An increasing demand for herbal products may endanger many traditionally used and pharmaceutically important plant species and their habitats. AMF colonize root tissues biotrophically and form an extensive network of extra-radical mycelium, providing a direct physical link between soil and plant roots **(Songachan L. S. and Kayang H., 2011).** The mycorrhizal fungi produce organic acids along with other molecules that metabolize the organic compounds and aid in the solubilization of mineral nutrients **(Manikanta Chikoti *et.al.*, 2022).**

Materials And Methods

Study Area: The experiment was conducted at the Department of Botany, Shri Mulikadevi Mahavidyalaya, Nighoj Tal. Parner during the period from July 2025 to June 2026. During the winter season, characterized by moderate daytime temperatures, distinctly cooler nights, and low humidity **Soil sampling:** Soil samples were collected in different village places in Parner tehsil and preserved in sterile polythene bags and stored in a refrigerator at 4^0 C until use. Soil samples up to 20 cm depth were collected.

Spore extraction: The soil samples were subjected to wet-sieving and decanting technique. **Gerdeman and Nicolson (1963)** for the isolation of spores. The isolated spores were picked up with a needle under a dissecting microscope and were mounted in polyvinyl lactoglycerol and observed under a compound microscope. Intact spores and sporocarps were mounted in PVLG and identified morphologically using taxonomic keys, including color, size, shape, hyphal attachment, bulbous suspensor, wall structure, number of wall layers, and wall thickness. Spores were photographed, and morphological characters were studied using a Leica ICC50E microscope with a high-definition digital camera and LAS-EZ imaging software. The AM fungal spores were identified using the Manual for Identification of VAM Fungi by **Schenck, N. C., and Perez, Y. (1990).** In most studies, AMF were identified using morphological characteristics of spores extracted from field-collected soils of the 13 Arbuscular Mycorrhizal Fungal species; approximately 25% were identified by using color, shape, and Size morphological characteristics; the remainder by using only morphological characteristics.

Results:

At specific sites in the Parner area, the prevalence and distribution of AM fungal species associated with onions were assessed. Using morphological and other diagnostic fungal characteristics, thirteen AM fungal species were identified in the onion rhizosphere at five selected sites. In the present study, a total of 13 species of AM fungi were isolated. Across the five sampling sites (S1 to S5), a total of 13 species belonging to three genera, *Glomus*, *Acaulospora*, and *Scutellospora*, were recorded. *Glomus* emerged as the most dominant genus with 8 species, showing peak diversity at Site 3 (4 species) and Site 1 (3 species), while being completely absent at Sites 4 and 5. *Acaulospora* exhibited the broadest spatial distribution, totaling 4 species with a steady presence of 1 species each across Sites 2, 3, 4, and 5. *Scutellospora* was the least abundant and most restricted genus, represented by only 1 species found exclusively at Site 3, suggesting that farmers at low-diversity sites (S2, S4, and S5) should adopt organic practices and biofertilizers to improve soil health.

Table No. 01: List of AM fungal species found in the rhizosphere soil of onion from five different sites.

Sr. No.	Name of Genus and Species	S1	S2	S3	S4	S5	FO %

Conclusion:

This study highlights significant variation in Arbuscular Mycorrhizal Fungi (AMF) species diversity across the five sampling sites, with a total of 13 species recorded among three genera. *Glomus* was identified as the dominant genus (8 species), while *Acaulospora* showed the broadest site distribution (4 species), and *Scutellospora* remained the most restricted (1 species). Site 3 demonstrated superior ecological health with the highest species richness (6 species), whereas Sites 2, 4, and 5 exhibited severely restricted fungal diversity (1 species each). These findings emphasize the necessity of targeted soil management strategies such as incorporating organic inputs and native AMF inoculants to enhance biological activity and soil fertility in low-diversity agricultural environments.

Acknowledgment:

I would like to express my gratitude to the Honourable Principal of Shri Mulikadevi Mahavidyalaya, Nighoj, as well as to the Department of Botany, for their continuous encouragement and valuable support throughout this research work. My appreciation further goes to the Agarkar Institute, Pune, for their support in the identification of AM fungi, and to the farmers from the study area for their valuable cooperation in data collection and related activities. Each of these contributions has played a significant role in the successful completion of this research, and I remain truly grateful.

Financial support and Sponsorship

Abstract

The business-to-business ("B2B") sales and marketing industry now depends on a mature ecosystem of intent-data and contact-enrichment platforms that scrape, aggregate, infer, and resell professional identifiers such as names, job titles, corporate email addresses, and behavioural "buying signals." Industry practice frequently proceeds on the untested assumption that such data, because it is professional in character or drawn from ostensibly public sources such as LinkedIn and corporate websites, falls outside the reach of data protection law. This paper undertakes a doctrinal analysis of that assumption across three regimes: India's Digital Personal Data Protection Act, 2023; the European Union's General Data Protection Regulation; and the fragmented sectoral and state-law framework of the United States, read together with the Computer Fraud and Abuse Act jurisprudence culminating in hiQ Labs, Inc v LinkedIn Corp. It argues that the "publicly available data" exemption is doctrinally narrower, and more jurisdiction-specific, than industry practice assumes; that purpose-limitation and inference-based reasoning consistently narrow the exemption once data is aggregated or repurposed for commercial profiling; and that a distinct regulatory blind spot exists around "contact enrichment" techniques that generate new personal data through inference rather than mere collection. The paper concludes with doctrinally grounded recommendations for statutory and regulatory clarification.

Keywords: *B2B intent data, contact scraping, publicly available data, data protection law, DPDP Act 2023, GDPR, purpose limitation, data brokers.*

Introduction

Modern business-to-business marketing has been transformed by "intent data" and "contact enrichment" platforms (commercial services such as ZoomInfo, Apollo.io, Cognism, Clearbit, and Bombora) that compile searchable databases of corporate contacts and infer purchasing intent from aggregated behavioural signals. These platforms typically build their databases by automated scraping of professional-networking profiles and corporate websites, by ingesting third-party cookie and IP-address data, and by algorithmically inferring or verifying corporate email addresses that were never themselves published anywhere. The resulting profile, comprising a named individual, a job title, an employer, a verified or guessed email address, and in many cases a predicted "intent" to purchase a category of product, is then licensed to sales and marketing teams for direct outreach. The industry's working assumption is that this activity sits outside the scope of data protection law because the underlying data is either "business," not "personal," in character, or because it is drawn from sources the data subject has herself made public. Neither premise withstands doctrinal scrutiny. No major data protection statute, whether the General Data Protection Regulation ("GDPR"), India's Digital Personal Data Protection Act, 2023 ("DPDP Act"), or the California Consumer Privacy Act as amended by the California Privacy

Rights Act ("CCPA/CPRA"), recognises a categorical carve-out for data merely because it relates to a person acting in a professional capacity.[1] The "publicly available data" exemption is real, but it is neither uniform across jurisdictions nor, on close doctrinal reading, a blanket licence for unrestricted commercial reuse. This paper interrogates the legality of B2B intent-data and contact-scraping practices through a comparative doctrinal lens, tracing how three major regimes define, condition, and narrow the public-data exemption, and identifying the resulting points of legal exposure for an industry that has, until recently, operated largely beneath regulatory attention.

Research Problem, Objectives, And Methodology

Statement of the Problem

B2B data vendors scrape or algorithmically infer personal data belonging to individuals with whom they have no direct relationship, and monetise that data at scale, largely on the strength of an assumed "public data" or "business data" exemption. Whether that assumption is legally sound has not been squarely tested in scholarship, which has concentrated overwhelmingly on consumer-facing data brokerage, facial recognition, and adtech rather than on the B2B contact-data economy.

Research Objectives

(1) To examine the statutory text and judicial or regulatory interpretation of the "publicly available data" exemption under the DPDP Act, GDPR, and CCPA/CPRA; (2) to assess whether B2B contact-scraping and intent-data aggregation practices fall within or outside these exemptions; (3) to compare the doctrinal architecture (categorical exemption, conditional balancing, or sectoral patchwork) adopted by each regime; and (4) to identify regulatory gaps and propose doctrinally coherent reform.

A. Research Questions

(i) Does the exemption for publicly available personal data under section 3(c)(ii) of the DPDP Act extend to B2B contact and intent data scraped and resold by commercial data aggregators? (ii) How does the GDPR's purpose-limitation and legitimate-interest doctrine constrain such practices differently from India's categorical exemption model? (iii) What is the doctrinal relationship between platform-access litigation under the Computer Fraud and Abuse Act ("CFAA") and liability under data protection law for the same scraping conduct? (iv) Is there an unregulated doctrinal gap around "contact enrichment" techniques that infer, rather than merely collect, personal data?

B. Methodology and Scope

This is a doctrinal (black-letter) legal study. Primary sources comprise the text of the DPDP Act, 2023 and the Digital Personal Data Protection Rules, 2025; the GDPR; the CCPA/CPRA and related California statutes; the CFAA; and judicial and regulatory decisions including *hiQ Labs, Inc v LinkedIn Corp*, the Clearview AI enforcement decisions of the Italian Garante, the French CNIL, and the UK Information Commissioner, and the California Privacy Protection Agency's order against Background Alert Inc. Secondary sources, including regulatory guidance, law-firm commentary, and academic analysis, are used to contextualise and corroborate the primary-source analysis. The study is confined to civil/regulatory data protection liability and does not examine criminal law, save where the CFAA intersects directly with the doctrinal question of "public" access.

Conceptualising B2b Intent Data And Contact-Scraping Practices

Two related but analytically distinct practices must be separated at the outset. **Contact scraping** is the automated extraction of identifying details (name, job title, employer, and sometimes a published email address) from a source such as a professional-networking profile or a corporate "About Us" page. **Intent-data aggregation** is the compilation of behavioural signals (content consumption on third-party publisher sites, IP-address-to-company resolution, cookie and device-graph data) to infer that a company, or an individual within it, is likely researching a purchase. A third practice, **contact enrichment**, sits between the two: vendors algorithmically generate or verify a corporate email address (for example, by testing common naming conventions against a company's domain) that was never itself published by the data subject or the employer. Each practice produces "personal data"

[1] General Data Protection Regulation (EU) 2016/679, art 4(1) (defining "personal data" as any information relating to an identified or identifiable natural person, without exception for professional or business capacity); Digital Personal Data Protection Act 2023 (India), s 2(t); California Civil Code §1798.140(v).

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

within the ordinary statutory meaning of that term in every regime examined in this paper, because each produces information that identifies or is reasonably capable of identifying a natural person.[2] The doctrinal question is therefore not whether such data is "personal," but whether, and under what conditions, its collection and reuse escapes regulation.

Comparative Legal Framework

A. The European Union: Conditional Exemption Within a Continuing Regulatory Regime

The GDPR contains no general exemption for "publicly available" personal data as such. Article 9(2)(e) provides a narrow basis for processing special-category data that the data subject has "manifestly made public," but this affects only the lawful-basis analysis for sensitive data; it does not remove ordinary personal data from the Regulation's scope altogether.[3] Ordinary contact and firmographic data, of the kind scraped by B2B vendors, therefore remains fully subject to the GDPR's core principles irrespective of the public visibility of its source.

Two doctrines do most of the regulatory work. First, the purpose-limitation principle requires that personal data collected for one purpose (a professional networking platform user maintaining a public profile for career-networking purposes) not be reused for an incompatible purpose (compiling a saleable sales-prospecting database) without independent legal basis, having regard to the compatibility factors listed in Article 6(4), including the link between the original and new purpose, the context of collection, and the reasonable expectations of the data subject.[4] A data subject who posts a professional biography for networking purposes has not thereby consented to, nor would reasonably expect, the same data being resold as part of a commercial sales-intelligence subscription. Second, where a controller obtains personal data other than directly from the data subject (the paradigm case of scraping), Article 14 obliges the controller to provide the data subject with prescribed information about the processing, subject to a disproportionate-effort exemption that data brokers frequently invoke but that supervisory authorities have applied narrowly.[5]

These doctrines were tested, and applied against a scraping-based business model, in the sustained European enforcement action against Clearview AI, a facial-recognition company that scraped billions of publicly accessible images to build a searchable biometric database. The Italian Garante fined Clearview €20 million in February 2022, finding that its reliance on legitimate interest under Article 6 could not justify processing that was opaque, disproportionate in scale, and incompatible with the purpose for which the underlying images had been shared, and further finding breaches of the transparency, purpose-limitation, and storage-limitation principles.[6] France's CNIL reached the same conclusion in December 2021 and subsequently imposed further penalties of €20 million and €5.2 million for continued non-compliance,[7] while the UK Upper Tribunal confirmed in October 2025 that Clearview's scraping-based processing constituted "behavioural monitoring" bringing it within the extraterritorial reach of the UK GDPR notwithstanding Clearview's lack of an EU or UK establishment.[8] The doctrinal

significance of the Clearview line for B2B contact scraping is direct: every decision rejected the proposition that public visibility of source data, without more, supplies a lawful basis for large-scale commercial repurposing. The same reasoning, namely legitimate-interest balancing that weighs the scale of collection, the opacity of the processing, and the incompatibility between original and secondary purpose, applies with equal force to a vendor scraping LinkedIn profiles to build a resalable sales-prospecting database, even though the individual scale and sensitivity of B2B contact data is materially lower than biometric identifiers.

B. India: A Categorical but Narrower Exemption

India's DPDP Act adopts a structurally different approach. Section 3(c)(ii) provides that the Act does not apply at all to personal data that is made, or caused to be made, publicly available by the data principal to whom it relates, or by a person under a legal obligation to make it public.[9] Unlike the GDPR's conditional, balancing-based approach, this is a categorical, threshold exemption: where it applies, the data falls outside the Act's scope in its entirety, and none of the Act's consent, notice, purpose-limitation, or data-principal-rights provisions attach to it.On its face, this exemption appears more permissive of contact scraping than the GDPR regime: a professional profile that an individual has herself posted to a networking platform falls within section 3(c)(ii) because the data principal herself made it public. Commentary on the provision, however, cautions against reading it as a general "public internet" pass.[10] Three doctrinal limits are notable. First, the exemption requires that the data principal (or a person under a legal duty) made the specific data public; data inferred by a third party, such as a guessed or algorithmically verified corporate email address, or a predicted purchase-intent score, was not "made publicly available" by the data principal at all, and therefore falls outside section 3(c)(ii) even if it is derived from public sources.[11] Second, where a scraped public data point is combined with non-public data, for example a name and job title scraped from a networking profile merged with a purchased or cookie-derived email address and behavioural intent score, the resulting composite profile is arguably new data that was never "made publicly available" as such, taking it outside the exemption's literal terms. Third, and most significantly, section 3(c)(ii) removes the data from the DPDP Act's scope, but does not immunise the processor from other bodies of Indian law, including contract, the tort of breach of confidence, intellectual property in a platform's terms of use, or the reasonable-security-practices obligation under section 43A of the Information Technology Act, 2000, that may independently restrict scraping conduct.[12] A further doctrinal complication is that the DPDP Act's exemption is binary and static: once triggered, it is not subject to an ongoing compatibility or proportionality assessment of the kind Article 6(4) of the GDPR imposes. This makes India's regime, considered purely on the statutory text, structurally more permissive of one-off scraping of self-published professional data, but it also means that where the exemption does not apply, because the data was inferred, aggregated, or combined with non-public sources (as most commercial intent-data products are), there is no intermediate, conditional basis (analogous to GDPR legitimate interest) on which such processing could be justified; the ordinary consent-and-notice architecture of the Act would apply in full, and B2B data vendors, as third parties without any relationship to the data principal, would typically be unable to satisfy it.[13] The constitutional backdrop

reinforces a narrow reading of the exemption. The DPDP Act was enacted in the wake of the Supreme Court's recognition of informational privacy as a facet of the fundamental right to privacy, and its proportionality standard.[14] A construction of section 3(c)(ii) that treated any scraped or inferred data as permanently and unconditionally outside statutory protection merely because a fragment of the underlying data was once visible online would sit uneasily with that constitutional foundation, and Indian courts asked to construe the provision in a contested B2B-scraping case would have strong interpretive grounds to read it narrowly, consistent with recent scholarly commentary rejecting a "blanket permission" reading of the exemption in the analogous context of AI training data.[15]

C. The United States: A Fragmented but Increasingly Assertive Patchwork

The United States has no comprehensive federal data protection statute. Regulation of B2B contact scraping is instead distributed across state consumer-privacy statutes, a state data-broker registration regime, Federal Trade Commission ("FTC") unfairness enforcement, and general-purpose computer-access and tort law. The CCPA excludes "publicly available information" from its definition of "personal information." As originally enacted, this exclusion was narrow, limited to information lawfully made available from federal, state, or local government records.[16] The CPRA broadened it in 2023 to also exclude information a business has a reasonable basis to believe is lawfully made available by the consumer or from widely distributed media, including information a person makes available where the consumer has not restricted it to a specific audience, language that is squarely capable of covering an open LinkedIn profile.[17] Even this broadened exclusion, however, does not extend to inferences drawn from public data. In 2025 the California Privacy Protection Agency ("CPPA") issued a decision and order against Background Alert Inc, a data-broker product built substantially on public-record information, holding that inferences the product generated (such as flagging "alarming patterns" or identifying likely family members or associates from underlying public records) constituted "personal information" regulated by the CCPA even though the source records themselves were publicly available, on the reasoning that seemingly innocuous public data points, once combined and used to generate inferences, present distinct re-identification and profiling risks.[18] This is the closest direct regulatory analogue, in any of the three jurisdictions studied, to the *intent* component of B2B intent data: a predicted purchase-intent score is, structurally, exactly the kind of inference the CPPA found unprotected by the public-data exclusion. California separately regulates data brokers as such. Its Data Broker Registration Law, as strengthened by SB 362 and SB 361, requires businesses that knowingly collect and sell to third parties the personal information of consumers with whom they have no direct relationship to register and disclose their practices, a definition that on its face captures B2B contact-data and intent-data vendors, whose entire business model consists of monetising data about individuals with whom they have no direct relationship.[19] A parallel enforcement track runs through the FTC's

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

unfairness authority under section 5 of the FTC Act, which does not depend on any statutory definition of "personal information" at all. In January 2024 the FTC took first-of-their-kind actions against data brokers Mobilewalla and Gravy Analytics, restricting their sale and use of sensitive location data derived substantially from behavioural and device-based signals, on unfairness grounds independent of any specific privacy statute.[20] These actions demonstrate that even where a state statute's "publicly available" carve-out might apply, a distinct and independent federal enforcement basis can still reach the same conduct. Finally, the CFAA and its interpretation in *hiQ Labs, Inc v LinkedIn Corp* address the access-control dimension of scraping rather than data protection as such, but the case is doctrinally indispensable because it is the leading authority on the meaning of "public" access to online data in American law. The Ninth Circuit held, first in 2019 and again on remand in 2022 following the Supreme Court's intervening decision in *Van Buren v United States*, that automated scraping of web pages that do not require authentication does not access a computer "without authorization" within the meaning of the CFAA, because there is no "gate," or access barrier, for such scraping to circumvent.[21] Yet the litigation did not end there: on remand to the district court, LinkedIn ultimately obtained summary judgment against hiQ on a breach-of-contract theory grounded in hiQ's violation of LinkedIn's terms of use, resulting in a stipulated judgment against hiQ and injunctive relief barring further scraping.[22] The doctrinal lesson is that CFAA legality and overall legality are not coextensive: scraping publicly accessible pages may escape criminal/computer-access liability while remaining independently actionable in contract or tort, an overlay entirely distinct from, and additional to, data-protection-law liability.

Doctrinal Synthesis: Three Models Of The "Public Data" Boundary

The comparative analysis reveals three structurally distinct doctrinal architectures for policing the public/private data boundary, each converging on the same substantive conclusion by different routes. The European Union adopts a **conditional, continuing-regulation model**: public availability of source data is never itself a jurisdictional exit from the GDPR; it is, at most, one factor bearing on the legitimate-interest balancing test and on the compatibility assessment for secondary use. Data remains regulated throughout, and the Clearview line of decisions confirms that regulators and courts will scrutinise the scale, opacity, and purpose-incompatibility of scraping-based commercial models notwithstanding the public visibility of the underlying images or profiles.

India adopts a **categorical, threshold-exit model**: once section 3(c)(ii) is satisfied, the data exits the Act's scope entirely, with no continuing purpose-limitation or proportionality overlay under the statute itself. This makes the Indian regime, on a narrow reading, more permissive for the discrete act of collecting self-published professional data, but the exemption's own textual limits, namely that it protects only data actually made public by the principal and not data inferred or generated by combining public and non-public sources, mean that the characteristic outputs of the B2B intent-data industry (verified emails, intent scores, enriched composite profiles) likely fall outside the exemption altogether and back within the Act's ordinary consent architecture, which such vendors are structurally ill-placed to satisfy. The United States adopts a **fragmented, multi-track model**: a narrow-to-moderate statutory carve-out for publicly available information at the state level, cut across by (i) an inference doctrine that pulls derived data back into regulation, as the CPPA's Background Alert order illustrates; (ii) a broker-specific

[20] Holland & Knight, 'FTC Cracks Down on Selling Sensitive Location Info, Restricts Use of Consumer Data for 1st Time' (JD Supra); building on the FTC's earlier findings in Federal Trade Commission, Data Brokers: A Call for Transparency and Accountability (May 2014), which documented data brokers' extensive reliance on scraping of publicly available and social-media sources.

registration and transparency regime aimed precisely at the no-direct-relationship business model that defines B2B intent-data vendors; (iii) an FTC unfairness track that operates independently of any statutory personal-information definition; and (iv) a computer-access and common-law contract/tort track, illustrated by *hiQ*, that can restrain scraping even where no privacy statute is violated at all. Despite their divergent architectures, all three regimes converge doctrinally on a single proposition: *public visibility of source data is a necessary but not sufficient condition for the lawful commercial reuse of personal data.* None of the three permits an unconditional, unlimited resale market in scraped or inferred personal data merely because some component of that data was, at some point, visible on the open internet. The B2B intent-data industry's operating assumption to the contrary reflects an under-tested doctrinal position rather than settled law in any of the jurisdictions examined.

A Regulatory Gap: Contact Enrichment And Inferred Data

The most significant doctrinal gap identified by this analysis lies not in scraping as such, which each regime addresses, however imperfectly, but in **contact enrichment**, the algorithmic generation or verification of contact details, most commonly corporate email addresses, that were never published by anyone. A vendor that infers alice.sharma@company.com from a scraped name and a known corporate email-naming convention, and verifies the guess through a mail-server ping, has not "collected" publicly available data in any straightforward sense; it has generated new personal data through inference. Under the GDPR, such an address is plainly "personal data" obtained other than from the data subject, triggering Article 14 notice obligations that the inferential method of creation makes practically difficult to satisfy. Under the DPDP Act, such an address was self-evidently not "made publicly available" by the data principal, and section 3(c)(ii) has no application to it at all. Under the CPPA's Background Alert reasoning, an inference of this kind would likely be treated as personal information regardless of the public status of its inputs. Yet none of the three regimes contains an explicit rule, guidance note, or reported enforcement decision addressing contact enrichment by name. It is, at present, regulated only derivatively, through the general inference and purpose-limitation doctrines discussed above, and remains one of the most widespread and least scrutinised practices in the B2B data economy.

Findings

1. The professional/personal data distinction assumed by industry practice has no textual basis in the GDPR, the DPDP Act, or the CCPA/CPRA; each defines personal data without any carve-out keyed to professional or business context.
2. The "publicly available data" exemption, wherever it appears, is doctrinally narrower than commonly assumed: it is conditioned (in the EU) by an ongoing balancing and compatibility test, or (in India) by a strict textual requirement that the data principal herself made the specific data public, or (in the United States) by an inference doctrine that regulators have begun actively to enforce.
3. Regulatory and judicial attention to scraping-based business models has concentrated overwhelmingly on consumer-facing contexts, such as facial recognition, location data brokerage, and background-check services, leaving the B2B intent-data and contact-enrichment industry comparatively unexamined despite structurally identical scraping, aggregation, and monetisation mechanics.
4. Even a favourable data-protection-law analysis does not exhaust a scraper's legal exposure: contract, tort, and platform terms-of-use claims, as *hiQ* demonstrates, operate as an independent and, in that case, ultimately decisive layer of liability.
5. Cross-border enforcement against non-compliant scraping-based businesses remains weak in practice, as the continued, largely unremedied operation of Clearview AI notwithstanding cumulative European fines well in excess of €60 million illustrates: a caution against assuming that a favourable doctrinal finding translates automatically into effective protection for data subjects.

Recommendations

1) The rules or subordinate guidance issued under the DPDP Act should expressly clarify that section 3(c)(ii) does not extend to composite or inferred personal data created by combining publicly available data with non-public data, aligning India's position with the reasoning applied to inferences under the CPPA's Background Alert order and avoiding an interpretive vacuum around contact enrichment.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

2) Indian courts and the Data Protection Board, when construing section 3(c)(ii) in a contested case, should read the exemption harmoniously with the proportionality standard articulated in *Puttaswamy*, rather than as an unconditional and permanent exit from statutory protection, particularly where data is subsequently aggregated or commercially repurposed at scale.
3) Regulators in each jurisdiction should issue explicit guidance addressing B2B contact-enrichment and email-verification practices specifically, given the near-total absence of reported doctrine on this discrete and widespread technique.
4) A registration and transparency obligation modelled on California's data-broker regime is a workable template for India and the European Union to adapt for B2B intent-data vendors, who by definition lack any direct relationship with the individuals whose data they monetise and are consequently the paradigm case such registration regimes are designed to reach.
5) Data subjects and platforms should be encouraged to treat contract and tort remedies, such as terms-of-use enforcement, breach of confidence, and trespass to chattels, as an independent and complementary layer of protection alongside statutory data-protection claims, following the practical lesson of the *hiQ* litigation's ultimate outcome.

Conclusion

B2B intent-data and contact-scraping practices occupy a doctrinal space that is far less settled, and far less permissive, than prevailing industry assumptions suggest. Across three structurally different legal systems (India's categorical threshold exemption, the European Union's conditional and continuing balancing regime, and the United States' fragmented but increasingly assertive patchwork of state, agency, and common-law doctrine), the consistent doctrinal thread is that public visibility of a data point is, at most, a necessary precondition for lawful reuse, never a sufficient one. The Clearview AI enforcement line, the CPPA's treatment of inferences in the Background Alert order, and the ultimate contract-based outcome of the *hiQ* litigation each independently confirm that scale, aggregation, inference, and commercial repurposing progressively erode whatever shelter the public-data exemption initially offered. The most acute and least examined point of legal exposure is contact enrichment (the algorithmic generation of contact data that was never public at all), which current doctrine reaches only indirectly. Closing that gap through express regulatory clarification, rather than continued reliance on an untested industry assumption, is the central doctrinal task this paper identifies for regulators in each jurisdiction studied.

Abstract

India's transition toward a renewable energy-led economy faces critical challenges in grid stability, demand forecasting, and efficient integration of intermittent power sources such as solar and wind. Artificial Intelligence (AI) is increasingly central to overcoming these constraints, enabling predictive load forecasting, real-time fault detection, and autonomous demand-response management across smart grid. Grid Mission, the IndiaAI Mission, and NITI Aayog's National Strategy for Artificial Intelligence. It further examines barriers to scale, including high implementation costs, inconsistent data interoperability across state utilities, cybersecurity vulnerabilities in AI-integrated grid systems, and the skills gap in AI-energy hybrid expertise. Through a review-based analytical framework, the paper proposes an integrated model aligning AI-enabled smart grid deployment with SDG-7 (Affordable and Clean Energy) and SDG-13 (Climate Action) within India's Viksit Bharat @2047 vision. The findings suggest that AI-optimized energy systems, if scaled with supportive policy and skilled workforce development, can position India as a global leader in sustainable, technology-driven energy infrastructure.

Index Terms— *Artificial Intelligence, Smart Grids, Renewable Energy, Digital Economy, Sustainable Development, Climate Action,*

Introduction

India has committed to achieving 500 GW of non-fossil fuel-based electricity generation capacity by 2030, a target that places unprecedented demands on the country's infrastructure. This paper examines how AI-driven energy management systems are accelerating India's clean energy transition while simultaneously catalyzing digital economy growth through green-tech innovation, energy-data infrastructure, and allied employment generation. The study evaluates the role of AI in optimizing distributed renewable energy resources, reducing transmission losses, and enabling decentralized microgrids for underserved and rural regions, drawing on national frameworks such as the National Smart electrical grid infrastructure. Unlike conventional thermal power, renewable sources such as solar and wind are inherently variable and weather-dependent, making their large-scale integration into a traditionally centralized and passive grid a Smart gridselectricity networks embedded with sensors, two-way communication, and digital control systems offer a foundation for managing this complexity. When enhanced with Artificial Intelligence (AI), these grids evolve from passive infrastructure into adaptive, self-optimizing systems capable of forecasting demand, predicting equipment failures, and automatically balancing supply from multiple intermittent sources in real time. This paper argues that AI-optimized smart grids are not merely a technical upgrade to India's power sector but a strategic enabler of the country's broader digital economy.

The infrastructure, data pipelines, and skilled workforce required to build and operate these systems generate economic activity that extends well beyond the energy sector itself into green-tech startups, data analytics services, and AI-energy hybrid employment. The paper situates this transformation within India's national policy landscape, including the IndiaAI Mission and the Viksit Bharat @2047 vision, and proposes a framework connecting AI-driven grid modernization to inclusive, sustainable

Literature Review

A substantial body of research has examined the application of AI and machine learning to smart grid operations. Studies have shown that AI models can significantly improve short- and long-term forecasting of solar and wind generation by learning from historical weather and load data, reducing curtailment and improving grid reliability [1], [2]. Deep learning and reinforcement learning techniques have been applied to dynamic scheduling, energy routing, and cyber-physical security within smart grid environments, demonstrating measurable reductions in operational cost and downtime [3]. Research specific to the Indian context highlights both the promise and the constraints of this transition. Analyses of India's electricity grid note that AI-based load management and predictive maintenance can enhance the efficiency of existing renewable assets without requiring immediate large-scale hardware replacement, making it a comparatively low-cost intervention for utilities operating under budget constraints [4]. Other work has examined AI-integrated smart grid sensors deployed in Indian pilot projects, including initiatives by state electricity boards and private distribution utilities, showing improvements in fault detection and load distribution [5]. At the same time, the literature consistently identifies structural barriers: inconsistent data standards across state utilities, limited interoperability between legacy and digital infrastructure, and a shortage of professionals trained at the intersection of power systems and AI [6]. Existing studies largely address these challenges from a technical or engineering standpoint. Comparatively little work explicitly connects AI-driven grid optimization to India's digital economy and national development policy — a gap this paper seeks to address by framing smart grid AI as an economic and developmental intervention, not solely a technical one.

India's Renewable Energy And Digital Policy Landscape

A. National Smart Grid Mission and Renewable Targets

India's National Smart Grid Mission provides the institutional scaffolding for grid modernization, focusing on advanced metering infrastructure, real-time monitoring, and demand-response capability. Combined with the government's renewable capacity targets, the mission creates the technical and regulatory groundwork necessary for AI-based optimization to be deployed at scale.

B. The IndiaAI Mission

Approved by the Union Cabinet with an outlay of over ₹10,371 crore, the IndiaAI Mission has expanded India's AI compute capacity to more than 38,000 GPUs and supports the development of indigenous foundation models across sectors. While the mission's initial application focus has centered on healthcare, education, and governance, its compute, skilling (FutureSkills), and startup-financing pillars are directly transferable to energy-sector AI applications, offering an existing institutional pathway for scaling AI-grid integration.

C. Digital Economy Linkages

The digital economy dimension of AI-optimized grids extends beyond utilities themselves. Grid modernization creates demand for sensor manufacturing, data infrastructure, cybersecurity services, and analytics platforms activity that contributes to GDP and employment independent of electricity generation itself. Positioning smart grid AI within this broader economic frame strengthens the case for coordinated investment across energy and digital policy.

Methodology

This study adopts a review-based analytical methodology rather than primary empirical data collection. Peer-reviewed journal articles, IEEE conference proceedings, and Indian government policy documents published between 2018 and 2026 were reviewed to identify recurring technical approaches, deployment outcomes, and adoption barriers relevant to AI-optimized smart grids in the Indian context. Sources were selected based on relevance to three criteria: (i) application of AI/ML techniques to grid forecasting, control, or security; (ii) explicit reference to Indian utilities, policy frameworks, or pilot deployments; and (iii) discussion of economic or workforce implications beyond pure engineering performance. Findings from this review were synthesized into the layered framework presented in Section V, and cross-checked against India's current policy instruments

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

the National Smart Grid Mission, the IndiaAI Mission, and the Viksit Bharat @2047 roadmap to assess feasibility and alignment.

Proposed Ai-Optimized Smart Grid Framework

Based on the reviewed literature and India's current policy architecture, this paper proposes a three-layer framework for AI-optimized smart grid deployment, structured to align technical capability with economic and developmental outcomes.

A. Layer 1 — Predictive Intelligence

This layer applies machine learning models including LSTM networks and temporal fusion transformers to forecast solar and wind generation, anticipate demand fluctuations, and predict equipment failures before they occur. Accurate forecasting reduces curtailment of renewable output and minimizes reliance on fossil-fuel-based backup generation during shortfalls.

B. Layer 2 — Autonomous Grid Management

Building on predictive outputs, this layer uses reinforcement learning and automated control systems to balance supply and demand in real time, manage energy storage dispatch, and coordinate decentralized microgrids particularly relevant for rural and remote regions where extending centralizedtransmission infrastructure is economically inefficient.

C. Layer 3 — Economic and Workforce Integration

The outer layer connects technical deployment to economic outcomes: state-level skilling programs for AI-energy hybrid roles, incentives for green-tech startups building grid analytics tools, and data-sharing standards that allow utilities, researchers, and AI developers to collaborate. This layer is where the framework's digital economy contribution is realized turning a technical upgrade into a source of sustainable employment and innovation. Together, these layers position AI not as an isolated efficiency tool but as connective infrastructure linking India's renewable energy ambitions with its broader digital and economic development goals. Table I summarizes representative AI techniques applicable to each layer, drawn from the reviewed literature.

Fig. 1. Three-layer framework for AI-optimized smart grid deployment

Table 1 : Ai Techniques By Framework Layer

Layer	Technique	Function
Predictive	LSTM, TFT	Load & generation forecasting
Predictive	CNN	Fault / anomaly detection
Autonomous	Reinforcement Learning	Real-time dispatch & storage
Autonomous	LSTM + CNN	Cyberattack (FDI) detection
Economic	Data analytics	Workforce & startup enablement

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Table 2 : Comparative Overview Of Indian Smart Grid Ai Pilots

Initiative	AI Focus / Layer	Reported Application
BESCOM, Bengaluru	Sensor-based monitoring & fault detection (Layer 1/2)	Early fault ID and improved load distribution on urban feeders
Tata Power-DDL, Delhi	AI sensors for renewable energy trading (Layer 1/3)	Renewable trading support and demand-side monitoring
Puducherry & Karnataka pilots	Sustainability-linked sensor monitoring (Layer 1)	Real-time monitoring and optimal load management
State utility boards (general)	AI load management & predictive maintenance (Layer 1/2)	Efficiency gains without large hardware replacement

Note: Compiled and adapted by the authors from pilot deployments and sector reviews cited in references [4] and [5].

Challenges And Limitations

Despite its promise, AI-optimized smart grid deployment in India faces several structural constraints that must be addressed for the proposed framework to scale effectively.

1)High Implementation Costs: Advanced metering infrastructure, sensor networks, and AI compute resources require substantial upfront capital, which is difficult for financially constrained state electricity boards to absorb without external investment or central government support.

2) Data Interoperability: Utilities across different states often use incompatible data formats and legacy systems, limiting the ability of AI models to be trained and deployed uniformly across regions.

3) Cybersecurity Vulnerabilities: Greater digital connectivity increases the grid's exposure to cyber-physical attacks, including false data injection and unauthorized access to control systems, necessitating AI-integrated security frameworks alongside optimization models.

4) Skills Gap: There remains a shortage of professionals trained at the intersection of power systems engineering and AI/data science, limiting the pace at which utilities can adopt and maintain these technologies without external technical support.

5) Rural Equity: Without deliberate policy design, AI-driven efficiency gains risk concentrating in urban and industrial grid segments, leaving rural and low-income regions — where the sustainability and inclusion case is strongest — under-served.

Alignment With Sustainable Development Goals And Viksit Bharat @2047

The proposed framework directly supports SDG-7 (Affordable and Clean Energy) by improving the reliability and cost-efficiency of renewable integration, and SDG-13 (Climate Action) by reducing reliance on fossil-fuel backup generation through more accurate forecasting and demand management. It further contributes to SDG-9 (Industry, Innovation and Infrastructure) through the digital economy activity generated around grid analytics, sensor manufacturing, and green-tech entrepreneurship. Within India's Viksit Bharat @2047 vision which envisions a developed, self-reliant nation by the centenary of independence AI-optimized smart grids represent a convergence point between two national priorities: energy security through renewables and technological leadership through AI. Realizing this convergence will require coordinated action across the Ministry of Power, MeitY, and state utilities, alongside sustained investment in workforce skilling to ensure the benefits of this transition are broadly and equitably distributed.

Conclusion And Future Scope

This paper has examined how AI-optimized smart grids can accelerate India's renewable energy transition while contributing to the growth of its digital economy. By reviewing existing technical literature and situating it within India's specific policy landscapethe National Smart Grid Mission, the IndiaAI Mission, and the Viksit Bharat @2047 vision the paper proposes a three-layer framework connecting predictive intelligence, autonomous grid management, and economic-workforce integration. While significant barriers remain, including implementation cost, data interoperability, cybersecurity, and workforce readiness, these challenges are addressable through coordinated policy design rather than being inherent limitations of the technology itself. Future research should pursue empirical validation of the proposed framework through pilot deployments in Indian state utilities, quantify the employment and

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

economic impact of AI-grid integration, and examine policy mechanisms such as data-sharing standards and cross-sector skilling programs that can accelerate equitable adoption across urban, rural, and industrial contexts alike.

Abstract

Today, several countries across the world have accepted ring roads as one of the reliable solutions for managing congestion of urban traffic. As ring roads influence local environment, it is necessary to understand their specific effects on the urban landscape. Hence, the present study attempts to understand the environmental effects of outer ring roads in India using SWOT analysis. The study utilises secondary data obtained from various sources including government reports, research papers and reference books. The study reveals that the construction and operation of outer ring roads in India cause both positive and negative effects on the environment.

Keywords: *Environment, SWOT, Outer Ring Roads, Urban, India.*

Introduction:

India is the most populated country of the world. More than 30% of its population resides in urban settlements. Most of the urban population in the country is concentrated into its four major urban agglomerations viz. Delhi, Mumbai, Kolkata and Chennai. Cities of the country fetch population from adjacent rural areas. They attract talent and investment creating vibrant centres with a huge potential to engine economic development of the country. Cities in India promote social change and boost innovation. They develop essential infrastructure and improve living standards of the citizens. However, cities in India are facing some environmental issues including traffic congestion in their core areas. Thus, it is one of the worldwide accepted practises to increase road capacity by developing ring roads to minimise traffic congestion in the urban areas, though this solution normally found to be useless in long run (Nugmanova Assel et. al.2019). Internationally, ring roads have recognized for their efficiency in solving traffic related problems by diverting peripheral-to-peripheral road traffic routes from congested urban cores (Al-Yasee et. al. 2025). Cities in India prefer to construction ring roads for their urban betterment. Some of the cities in the country have constructed ring rods earlier whereas, others have started accepting this option in recent past (Nallathiga, R. 2017). For instance, the Outer Ring Road (ORR) is a main transportation corridor being established along the edge of Chennai City (Kumar A. and Pooja 2016). This six-lane access-controlled highway is constructed along the Chennai's western and northern periphery. With this in mind, the present study attempts to understand the environmental significance of outer ring roads using SWOT analysis.

Objectives:

1. To understand the environmental Strengths and Weaknesses of outer ring roads.
2. To comprehend Opportunities and Threats to environment from outer ring roads.
3. To provide appropriate suggestions for enhancing the role of outer ring roads in ensuring urban environmental suitability.

Methodology:

A theoretical and descriptive method has primarily been recognised and adapted for the present study. The work depends on the secondary data sources including government reports, research publications, news articles and reference books. Due to its reliability, simplicity and as it is a focused technique of SWOT

Website: https://bnir.us

(Strengths, Weaknesses, Opportunities and Threats) analysis has been adapted to understand the environmental significance of outer ring roads.

Results and Discussion:

Ring roads in India play an important role in reducing traffic congestions in core area of the cities. They substantially contribute to the economic growth, support regional development and help cope with the urban environmental issues. Ring roads show positive as well as negative effects on urban environment. The environmental consequences of ring roads are the outcome of existing land use pattern, method and material used for construction, maintenance of ring road during and after its construction, local ecological sensitivity and layout of the settlement. Indias ring road projects recognises several environmental aspects including environmental pollution, changes in land use and land cover, climate resilience, status of wild life, availability of land and water, soil quality, practice of resource conservation and environmental sustainability. Environmental consequences of ring roads in India are therefore need to be understood thoroughly. Accordingly, the present study attempts to learn about the environmental consequences of ring roads in India by conducting SWOT analysis, as this technique is focused, help make informed decision, improve strategic planning and identify quantitative advantages without a need of complex training and costly tools.

SWOT Analysis:

The SWOT analysis of outer ring roads in India shows many positive effects on local environment initially. However, as time passes, different human activities develop in the vicinity of ring roads and they pose negative effects on the environment.

Strengths

Outer ring roads help reduce congestions of traffic in the inner city areas. They redirect heavy and long-distance vehicles towards urban peripheries avoiding their entry into the densely populated areas and market places of the city. They also help heavy vehicle maintain steady speeds and keeping cargos and commercial trucks away from the commuter's daily local traffic. Diversion of heavy vehicles towards urban periphery help reduce noise pollution in the residential and commercial segments of the settlements decreasing traffic density and sluggishness of traffic flow. It also helps bring down the levels of noise pollution in inner city. Ring roads offer wide scope for tree plantation. Green belts can be developed by planting indigenous trees along sides and at the road divider of the ring road to create environmental cushion. As heavy containers and big size vehicles passes through outer ring roads, this road side greenery help reduce the levels of noise and air pollution. They act as a carbon and dust sink. Trees planted at both the edges of road hold soil particles and prevent soil erosion on steep embankments. Ring roads if integrated with the highway drainage network and urban drainage system, they help collect surface runoff especially during rainy season. Shredded scrap tyres, recycled asphalt and single use plastic blended into the asphalt binder can be used as a construction material of ring roads and it ensures the practice of effective waste management. In case of urban congestions, outer ring roads can be used as primary safety valves. They play a strategic role in emergency traffic management. As they encircle the entire city, they connect radial highways. Ring roads thus play an important role as a backbone of disaster response and evacuation logistics.

Weaknesses

Acquisition of land for ring road construction is most challenging task. Wide corridors, safety buffer and space for future expansion need acquire vast land. Removal of natural vegetation is the immediate and visible environmental change in the practice of ring road construction. A multilane outer ring road when encircles entire city, it converts a large area into impermeable surface and create a massive hydrological challenge in urban landscape. Concrete roads cover a huge surface of water absorbent soil and it results into waterproofing of the surface. The construction of ring road leads to compaction of soil due to movement of heavy vehicles in the vicinity of construction site. Ring roads are also the source of water pollution. Trickled oil when get mixed with surface water, especially during rainy season, it leads to water pollution. Ring roads when completely encircles the city, they act as a leading cause of habitat and land scape fragmentation. It poses island effect by trapping local fauna inside and outside of the road ring. Many small animals and reptiles get blocked from their routine route. The construction of outer ring road generates huge amount of solid waste. Demolition of existing structure and excavation before starting construction as well as after construction leftover material generate huge amount of solid waste. The extensive embankments of ring roads often lead to rill and gully erosion which is responsible of soil loss. Ring roads convert fertile soil into asphalt-based infrastructure. It creates irreversible changes into the land use and

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

land cover pattern, promote food insecurity and harm rural livelihood at local level.

Opportunities.

Restoration of ring road construction induced land degradation need focused ecological knowhow to repair severely compacted soil. Stabilization of steep slopes and reconnecting fragmented wildlife habitat create a wide scope for reclamation. There is an opportunity for construction of under passes to ensure safety movement of wild animals and need of building specialised tunnels culverts under the road. Mitigation of environmental loss created by habitat fragmentation can be ensured through construction of such structures. Outer ring roads normally cover an extensive periphery of urban zones, where extension of traditional electric grid cable proves to be costly and ineffective for operation. Solar lamps offer a best solution to cope up with this problem. Using solar lamps for the lighting of ring roads is eco-friendly, which support environmental sustainability. Ring roads directly support rain water harvesting and ground water recharge. As they cover a large area around cities, they generate a huge volume of surface runoff, particularly during rainy season. Collection of this water help control flood and also support ground water recharge. Integration of noise barriers and tree plantation along both the sides of ring road provide durable option to cope with the high-speed vehicular noise. Selection of indigenous species for tree plantation offer a variety of ecological advantages including conservation of biodiversity. Construction and operation of ring roads around cities also proves themselves to be of great help in sustainable urban planning. It defines limit for the spatial expansion of city and also safeguard the city core areas promoting regional development. There is a wide scope for carbon efficient construction of ring roads. Use of low greenhouse gasses emitting raw materials, adaptation of strategically designed planning, technologically assisted operation and energy efficient engineering can be involved in upholding the environmental sustainability of outer ring roads.

Threats

Outer ring road leads to highway induced urban sprawl and land-use conversion from agricultural to commercial and residential. It brings major changes affecting ecological set up. Ring roads normally increases accidents and mortality of wild animals. After construction, ring roads initially shows positive environmental effects including shifting source of air and noise pollution away from city. However, as time passes, it is because of the expansion of highway induced urban sprawl, concentration of various economic activities take place around ring road, posing adverse effects on the local environmental conditions. Permanent loss of wild life habitat and constant disturbance to local fauna leads to biodiversity. Lots of multilayer asphalt and concrete of the ring road absorbs large amount of solar radiation and act as a massive solar sink. It brings drastic changes in micro climate of the urban zone. Outer ring roads often leads to unplanned urban development. They provide better access to previously remotely located areas and thereby triggers the un-regularized real estate expansion. Ring road brings changes in natural drainage pattern at local level. Surface water if not managed properly it increase the severity of flash flood. Long distance vehicular traffic of ring roads further attracts a variety of commercials including eateries, vehicle repair garages, fuel stations and tyre puncture repairing shops. Construction and operation of outer ring roads in the vicinity of urban zone may lead to loss of local ecosystem.

Conclusion:

The present study concludes that, the construction of outer ring roads show both positive and negative effects. The positive environmental effects of ring roads include relief from traffic congestion in core urban areas, reduction in emission of greenhouse gasses. improvement in air quality and control on noise pollution. However, the negative effects of outer ring roads on environment includes urban sprawl, Habitat fragmentation, increased car dependency and bigger total emission of greenhouse gasses. For the few years after construction, outer ring roads improve local environmental quality. However, over the time they cause environmental degradation. Homogeneous combination of stringent land use categorization, monetary discouragements for driving and unified transportation system may help cope with the environmental issues created by outer ring roads in urban areas of the country.

Abstract

Contemporary American literature increasingly responds to the ecological crises generated by climate change, environmental degradation, resource depletion, social inequality, and unsustainable human practices. Barbara Kingsolver's Flight Behavior (2012) and Octavia E. Butler's Parable of the Sower (1993) offer powerful literary representations of societies confronting environmental instability and its social consequences. Although the novels differ significantly in genre, historical context, and narrative form, both place women at the centre of ecological and social transformation. This paper examines the representation of women, nature, climate crisis, environmental justice, and sustainable futures in the two novels through an ecofeminist framework. It focuses particularly on Dellarobia Turnbow in Flight Behavior and Lauren Olamina in Parable of the Sower, arguing that their experiences reveal the interconnectedness of environmental exploitation, patriarchal structures, economic inequality, and social vulnerability. In Kingsolver's novel, the unexpected arrival of monarch butterflies in rural Appalachia becomes a visible manifestation of climate disruption and a catalyst for Dellarobia's intellectual and personal awakening. In Butler's dystopian narrative, climate change, drought, water scarcity, violence, economic collapse, and displacement create a world in which Lauren must develop new forms of survival and community. The paper further argues that both novels move beyond representations of ecological catastrophe by imagining possibilities for resilience, ecological consciousness, collective responsibility, and sustainable futures. Their concerns correspond particularly with the United Nations Sustainable Development Goals, including gender equality, reduced inequalities, sustainable communities, responsible consumption, and climate action. Through a comparative ecofeminist reading, this study demonstrates that contemporary American literature can function as an important cultural space for interrogating environmental injustice and imagining alternative relationships between women, society, and the natural world.

Keywords: *Ecofeminism, Sustainable Development, Climate Change, Environmental Justice, Ecocriticism, Barbara Kingsolver, Octavia E. Butler, Flight Behavior, Parable of the Sower*

Introduction

The twenty-first century has witnessed an intensification of ecological concerns involving climate change, biodiversity loss, environmental degradation, water scarcity, food insecurity, and the displacement of human populations. These concerns have transformed environmental issues from matters of scientific debate into questions of social justice, political responsibility, gender equality, and human survival. Climate change does not affect all individuals and communities equally.

Its consequences are shaped by economic position, geographical location, access to resources, gender, race, and social power. Consequently, the environmental crisis must be understood not merely as a crisis of nature but also as a crisis of human relationships and social structures.Literature provides a significant cultural space in which these complex relationships can be explored. Contemporary American fiction, in particular, has increasingly engaged with climate anxiety and ecological uncertainty. Literary narratives allow environmental change to be experienced not only as an abstract scientific phenomenon but also through individual bodies, families, communities, landscapes, and everyday experiences. Ecological fiction can therefore transform statistical and scientific accounts of climate change into narratives of human vulnerability and ethical responsibility. Within this context, Barbara Kingsolver's Flight Behavior and Octavia E. Butler's Parable of the Sower are particularly significant. Published almost two decades apart, the novels anticipate and dramatize different dimensions of environmental instability. Kingsolver's *Flight Behavior* centres on Dellarobia Turnbow, a young working-class woman living in rural Appalachia whose encounter with millions of monarch butterflies unexpectedly changes her understanding of her own life and the world around her. The butterflies have deviated from their expected migration pattern, and their presence becomes a visible sign of a larger ecological disturbance. Recent scholarship similarly identifies the displaced monarch migration as a representation of ecological disruption and emphasizes the novel's concern with climate justice, psychological avoidance, and human/non-human interdependence (Lee). Butler's Parable of the Sower, by contrast, imagines a near-future United States devastated by environmental and social collapse. Water scarcity, drought, extreme heat, economic inequality, violence, displacement, and political instability characterize Lauren Olamina's world. Lauren is a young African American woman who possesses hyperempathy, an unusual condition through which she experiences the pain and pleasure of others. Her bodily sensitivity becomes both a vulnerability and a source of ethical awareness. Recent scholarship has emphasized the relationship between climate change, bodily vulnerability, gender, class, displacement, and violence in Butler's novel (Kim 33-53).

Although *Flight Behavior* and Parable of the Sower differ in their narrative approaches, both novels connect environmental crisis with structures of social inequality. Both also place women at the centre of this crisis. Dellarobia and Lauren are not passive victims of ecological transformation. Instead, their experiences lead them toward new forms of consciousness, agency, and responsibility. Dellarobia gradually moves beyond the restrictions of her domestic and social environment, while Lauren develops a new philosophy and begins constructing a community based on adaptability and cooperation. An ecofeminist approach is particularly appropriate for examining these novels because ecofeminism explores the interconnected relationships between the oppression of women and the exploitation of nature. Ecofeminist thinkers have challenged hierarchical systems that construct nature, women, animals, and marginalized communities as subordinate to dominant masculine, human-centred, or capitalist structures. In this sense, environmental destruction and gender inequality cannot always be treated as separate problems. Both may emerge from systems based on domination, exploitation, and unequal access to power.This paper therefore argues that *Flight Behavior* and Parable of the Sower present ecological crisis as inseparable from gender inequality, economic vulnerability, and social injustice. Through Dellarobia Turnbow and Lauren Olamina, Kingsolver and Butler challenge patriarchal and anthropocentric structures while foregrounding women's ecological consciousness, resilience, and capacity for community-building. The paper further argues that both novels move beyond ecological catastrophe by imagining alternative sustainable futures based on awareness, adaptability, cooperation, and justice.

Ecofeminism, Ecocriticism, and Sustainable Development

Ecofeminism emerged from the intersection of feminist and environmental movements and developed as a critical framework for examining the relationships among gender, nature, power, and domination. One of its central concerns is the historical tendency of patriarchal systems to construct hierarchical binaries such as man/woman, culture/nature, reason/emotion, human/animal, and civilization/wilderness. Such binaries place one term above another and establish systems of domination. Karen J. Warren argues that feminist philosophical analysis must examine the conceptual structures through which the domination of women and nature becomes normalized. Her work identifies the relationship between hierarchical thinking and forms of oppression. From an ecofeminist perspective, therefore, the exploitation of the natural world is not an isolated environmental problem. It is connected to broader cultural assumptions about power, superiority, control, and ownership. Carolyn Merchant similarly examines the transformation of Western attitudes toward nature and argues that the mechanization of the natural world contributed to its treatment as an object available for exploitation. Vandana Shiva, from a postcolonial and Global South perspective, connects ecological destruction with economic systems that undermine local communities and women's knowledge of land, food, and natural resources. Val Plumwood further challenges anthropocentric and dualistic systems that position human beings above the non-human world. These theoretical ideas are highly relevant to Kingsolver and Butler. Both writers challenge the assumption that humans exist independently of ecological systems. Their novels repeatedly

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

demonstrate that environmental instability enters human life through food, water, migration, health, family structures, economic conditions, and social relationships. Ecocriticism complements ecofeminism by examining the representation of the environment and human/non-human relationships in literature. Lawrence Buell argues for an environmental imagination that recognizes the environment as an active presence rather than a passive background. Similarly, Cheryll Glotfelty defines ecocriticism as the study of the relationship between literature and the physical environment. These approaches allow literary critics to examine not only how nature is represented but also how narratives challenge anthropocentric assumptions. The concept of sustainable development adds another dimension to this discussion. Sustainability requires a balance between environmental protection, economic development, social justice, and the well-being of future generations. The Sustainable Development Goals provide a global framework for addressing these concerns. The novels considered in this paper are particularly relevant to SDG 5, Gender Equality; SDG 10, Reduced Inequalities; SDG 11, Sustainable Cities and Communities; SDG 12, Responsible Consumption and Production; and SDG 13, Climate Action. Thus, ecofeminism and sustainable development can be brought together through the concept of relational responsibility. Human beings cannot create sustainable futures without reconsidering their relationships with other human beings, non-human life, and the natural environment.

Climate Crisis and Ecological Disruption in *Flight Behavior*

Barbara Kingsolver's *Flight Behavior* begins with an ecological mystery that gradually becomes a climate narrative. Dellarobia Turnbow encounters an enormous population of monarch butterflies in the woods near her Appalachian home. Their unexpected presence initially appears miraculous, but scientific explanations reveal a more disturbing possibility: the butterflies have been displaced because of changing environmental conditions.

The monarch butterflies are central to the novel's ecological symbolism. Their migration is an established natural pattern, and their unexpected arrival demonstrates the disruption of that pattern. The butterflies therefore function as indicators of environmental change. They are not simply beautiful objects for human observation. Their altered migration reveals that human activity and climate change can disrupt ecological systems.

The novel's ecological crisis is particularly effective because Kingsolver connects the global with the local. Dellarobia initially understands the event through her immediate environment, while scientists interpret it through larger climatic processes. This movement from local observation to global understanding is central to the novel. Christopher Lloyd and Jessica Rapson argue that Flight Behavior connects local and planetary experiences of climate change by placing geographically specific human experiences within the larger context of the Anthropocene. Dellarobia's transformation mirrors this movement. At the beginning of the novel, her world is limited by poverty, marriage, motherhood, domestic expectations, and the economic difficulties of her family. Her encounter with the butterflies destabilizes this restricted worldview. What initially appears to be a private experience gradually becomes an ecological and scientific question. The butterflies therefore serve two functions. First, they represent ecological disturbance. Second, they stimulate Dellarobia's intellectual awakening. Her movement toward environmental consciousness parallels her movement toward personal independence.

This relationship between ecological awareness and female empowerment is central to an ecofeminist reading of the novel. Dellarobia's social position is shaped by patriarchal expectations. She is expected to perform domestic responsibilities and accept the limitations of her marriage and community. Her intellectual potential is largely unrecognized. The ecological event gives her an opportunity to encounter scientific knowledge and alternative ways of understanding her world. Recent research has similarly interpreted Dellarobia's development as a movement from personal restriction toward ecological and feminist consciousness. Hu and Wang describe the novel as a representation of ecological crisis and feminist awakening, particularly through Dellarobia's psychological and moral transformation. The significance of this transformation lies in the connection between the personal and the ecological. Dellarobia's liberation is not represented as a simple rejection of domestic life. Instead, her changing relationship with the environment encourages her to reconsider the assumptions that have governed her own existence. She begins to recognize that the structures limiting her choices are part of a larger social system.

Women, Poverty, and Environmental Vulnerability

One of the major contributions of *Flight Behavior* is its refusal to separate environmental problems from economic realities. Climate change is not experienced by Dellarobia as an abstract global problem. It becomes visible through changes in the land, farming practices, livelihoods, weather, and community life. Dellarobia's working-class position is important because environmental vulnerability is frequently connected to economic vulnerability. Individuals with limited economic resources have fewer opportunities to escape environmental damage or adapt to ecological disruption. The novel therefore challenges the assumption that climate change is experienced equally by everyone. This dimension of the novel can be understood through environmental justice. Environmental justice emphasizes the unequal distribution of environmental risks and benefits. Those

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

with greater economic and political power often possess greater capacity to protect themselves from environmental harm, while poorer communities may experience greater vulnerability. The Appalachian setting is particularly important in this regard. The landscape is not merely a picturesque rural backdrop. It is a lived environment shaped by economic dependence, land use, agriculture, family structures, and ecological change. Kingsolver's narrative therefore creates an intersection between environmental and social concerns. The novel also questions the cultural tendency to deny or avoid climate change. Scientific explanations compete with religious interpretations, economic interests, and personal beliefs. This conflict demonstrates that environmental knowledge is also shaped by social and political power. Lee's study of *Flight Behavior* identifies psychological avoidance, denial, detachment, and inaction as significant dimensions of the novel's treatment of climate crisis. Dellarobia's development is important because she becomes increasingly willing to acknowledge uncomfortable realities. Her ecological awakening is therefore also an epistemological awakening. She learns to question what she has been taught to accept and to recognize connections among apparently unrelated events. This capacity to question established assumptions is an important dimension of ecofeminist consciousness. Ecofeminism does not merely ask women to become environmental protectors. Rather, it questions the structures of knowledge and power that have historically separated humans from nature and reason from embodied experience.

Dellarobia Turnbow and Ecofeminist Agency

Dellarobia can be understood as an ecofeminist protagonist because her personal development becomes inseparable from her changing understanding of nature. Her encounter with the butterflies expands her sense of the world beyond the boundaries of marriage, motherhood, and domestic labour. Her agency emerges gradually. At the beginning, she does not possess the social or intellectual authority associated with scientific expertise. Yet she becomes an important witness to ecological change. Her experiential knowledge is eventually brought into conversation with scientific knowledge.

This interaction between experiential and scientific knowledge is significant from an ecofeminist perspective. Traditional patriarchal systems often privilege abstract, institutionalized, and supposedly objective forms of knowledge while dismissing embodied, local, and experiential knowledge. Kingsolver complicates this hierarchy by showing how Dellarobia's lived experience becomes part of the process of ecological understanding. The butterflies also challenge the human-centred perspective of the community. Their presence interrupts ordinary routines and forces the characters to acknowledge the agency of the non-human world. The environment is no longer simply a resource for human use. It becomes an active participant in the narrative. The relationship between women and non-human nature should not, however, be reduced to the idea that women are naturally closer to nature. Such a claim can reinforce the very gender stereotypes ecofeminism seeks to challenge. Instead, Kingsolver's novel can be read as demonstrating that ecological awareness becomes possible when hierarchical divisions between humans and nature are questioned. Dellarobia's transformation consequently represents both personal and ecological awakening. Her growing awareness enables her to reconsider her identity, her relationships, and her place within her community.

Ecological Apocalypse in *Parable of the Sower*

If *Flight Behavior* represents climate change through an ecological disruption that gradually becomes visible to a community, Parable of the Sower presents a society in which environmental collapse has already transformed everyday life. Published in 1993, Butler's novel imagines a future United States suffering from extreme environmental and social instability. Water is scarce, economic inequality is severe, communities are insecure, and violence is widespread. The novel's future is therefore not a single ecological catastrophe but an interconnected system of environmental and social crises. Lauren Olamina grows up inside this unstable world. Unlike Dellarobia, who gradually becomes aware of climate change, Lauren understands from an early age that the world she inhabits is changing. Her intelligence, observation, and hyperempathy allow her to recognize the vulnerability of human beings and the necessity of adaptation. Recent scholarship emphasizes that Butler's novel presents climate change as an unequal catastrophe rather than a universal experience affecting everyone in the same manner. Kim argues that environmental crisis in Parable of the Sower is mediated through bodies and intensified by existing inequalities of class, gender, and power. This perspective is essential to understanding Butler's ecofeminism. Climate change does not simply destroy landscapes. It affects bodies. It determines who has access to water, who can travel safely, who is vulnerable to violence, and who can protect themselves from exploitation. The novel therefore demonstrates that environmental crisis and social injustice reinforce each other.

Lauren Olamina: Hyper empathy and Ecological Consciousness

Lauren's hyper empathy is one of the most significant devices through which Butler explores interconnectedness. Lauren experiences the pain of others, making emotional and physical boundaries unstable. From an ecofeminist perspective, hyper empathy can be interpreted as a metaphor for relationality. Lauren cannot completely isolate herself from the suffering around her. Her body becomes a site through which the consequences of violence are experienced.

Her condition initially appears to be a weakness. In a violent world, the capacity to feel another person's pain can be dangerous. However, Lauren gradually

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

transforms this vulnerability into a form of ethical awareness. Her hyper empathy parallels the ecological interconnectedness that the novel explores. Human beings depend on water, soil, plants, animals, climate, and one another. The destruction of one part of the system eventually affects others.

Karla Rohová's ecofeminist and ecocritical study similarly identifies hyper empathy and Earth seed as central to Butler's ecological vision. Her analysis emphasizes Lauren's relationship with both living and non-living nature and considers the sustainability of the solutions Lauren develops in response to ecological catastrophe. Lauren's body therefore becomes a metaphorical ecological sensor. Her sensitivity reveals the consequences of violence that other characters attempt to ignore. This makes her an important challenge to the individualistic values of the collapsing society.

Gender, Violence, and Environmental Injustice

Gender is inseparable from environmental crisis in Parable of the Sower. As social structures collapse, women become particularly vulnerable to violence, exploitation, sexual assault, and forced dependency. The novel's representation of women's vulnerability illustrates an important principle of environmental justice: environmental disasters intensify existing inequalities. A society already structured by patriarchy does not become gender-neutral during ecological collapse. Instead, the crisis can deepen existing forms of domination.

Lauren's experiences reveal the dangers faced by women travelling through unstable environments. She must develop strategies of protection and adaptation while simultaneously negotiating her identity as a young Black woman. The novel therefore refuses to present survival as a purely individual achievement. Survival depends upon relationships, cooperation, knowledge, and collective responsibility.

Butler's critique of hierarchy extends beyond gender. Race, class, religion, economic power, and access to resources intersect throughout the novel. The environmental crisis becomes a mechanism through which existing inequalities become more visible. The novel consequently supports an intersectional understanding of ecofeminism. Women cannot be discussed as a homogeneous category. Lauren's experience is shaped by her gender, race, age, economic position, and physical condition. Her environmental vulnerability is therefore multidimensional.

Earth seed and the Possibility of Sustainable Futures

The most significant difference between Butler's novel and conventional dystopian narratives is Lauren's refusal to accept collapse as the final condition of human existence. Through Earth seed, she develops a philosophy centred on change, adaptation, responsibility, and collective transformation. The Earth seed philosophy is especially important because it rejects the fantasy of returning to a stable past. Lauren recognizes that the old social order has collapsed and that survival requires adaptation to new realities. Her famous formulation, "God is Change," becomes a central philosophical principle of the narrative (Butler). Rather than imagining nature as fixed and humanity as separate from it, Earth seed emphasizes transformation. This concept can be interpreted as a sustainable philosophy because sustainability requires adaptation rather than denial. A changing climate demands new social, economic, and ecological practices. Lauren's response is therefore not to dominate nature but to understand change and work with it. Her establishment of a community further develops this principle. The community represents an alternative to the individualism, violence, and competition that characterize the collapsing society. The Earth seed community attempts to create relationships based on cooperation and shared responsibility. Although Butler does not present this community as a perfect utopia, its existence demonstrates that sustainable futures require collective rather than purely individual solutions. Recent scholarship describes Lauren's Earth seed community as an alternative form of community formation grounded in shared vulnerability and interdependence.

Comparative Analysis: Dellarobia and Lauren

Dellarobia Turnbow and Lauren Olamina are separated by genre, historical period, race, age, geography, and social circumstances. Yet both protagonists experience ecological crisis as a catalyst for personal transformation. Dellarobia begins from a position of psychological and social confinement. Her ecological awakening develops through an unexpected encounter with the monarch butterflies. Lauren begins with a heightened awareness of ecological instability and must immediately develop strategies for survival. The contrast between Dellarobia Turnbow and Lauren Olamina can therefore be understood through their different experiences of ecological crisis and their respective journeys toward awareness and agency. Dellarobia encounters the ecological crisis unexpectedly, whereas Lauren grows up within a world already shaped by environmental and social instability. As a rural Appalachian woman, Dellarobia's experiences are largely influenced by domestic and economic restrictions, while Lauren, as a young African American woman, faces social collapse, violence, and physical danger. The monarch butterflies serve as a catalyst for Dellarobia's ecological awareness, whereas Lauren's condition of hyper empathy enables her to perceive and respond to the suffering around her. Consequently, Dellarobia gradually moves toward ecological consciousness, while Lauren begins her journey with an established awareness of environmental and social crises. This difference is also reflected in their responses to existing social structures. Dellarobia begins to question the structures that constrain her, particularly those related

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

to marriage, family, religion, and economic dependence, whereas Lauren seeks to create an alternative social philosophy through Earthseed. Her journey is therefore primarily one of individual awakening and the development of personal agency, while Lauren's journey extends toward collective leadership and the reconstruction of society. Thus, Dellarobia represents an awakening to ecological and personal consciousness, whereas Lauren represents adaptation, collective resilience, and the reconstruction of social life in the face of environmental catastrophe. Despite these differences, both characters challenge conventional models of female passivity. Dellarobia's transformation is particularly significant because she develops a voice in a community where women are expected to remain within traditional domestic roles. Lauren's transformation is even more radical because she becomes a leader and visionary in a society where conventional institutions have failed. Both novels thus present female agency as connected to environmental awareness. Neither protagonist simply "saves nature." Instead, each recognizes that human survival depends on understanding ecological relationships.

Women and the Rejection of Anthropocentrism

Both novels challenge anthropocentrism, the belief that human interests should occupy the centre of moral and ecological consideration. In *Flight Behavior*, the monarch butterflies disrupt the assumption that the landscape exists primarily for human use. Their migration pattern is altered by environmental conditions beyond the immediate control of the community. Their presence forces humans to recognize that ecological systems operate according to relationships extending beyond human needs.

In *Parable of the Sower*, environmental degradation reveals the consequences of treating natural resources as limitless. Water scarcity becomes one of the most important indicators of ecological collapse. The novel demonstrates that once natural systems are pushed beyond their limits, social institutions also become unstable. The two novels therefore present ecological crisis as a consequence of failed relationships. Human beings attempt to control land, resources, animals, and one another, but the results are instability and suffering.

Ecofeminism provides an important framework for understanding this connection because it challenges the same hierarchical logic at multiple levels. The domination of women and the domination of nature may emerge from a common ideology of control.

Environmental Justice and the Sustainable Development Goals

The environmental crises represented in the two novels correspond closely with the concerns of sustainable development.

SDG 5: Gender Equality

Both Dellarobia and Lauren demonstrate the consequences of gender inequality. Dellarobia is restricted by domestic expectations, while Lauren faces intensified gender-based vulnerability during social collapse. Their journeys nevertheless demonstrate the importance of women's agency and participation in decision-making.

SDG 10: Reduced Inequalities

Economic and social inequality intensify the effects of environmental crisis in both novels. Poor communities possess fewer resources for adaptation and recovery.

Flight Behavior highlights the vulnerability of a rural working-class community, while Parable of the Sower presents extreme inequality as one of the foundations of social collapse.

SDG 11: Sustainable Communities

Butler's Earthseed community is especially relevant to the idea of sustainable communities. Lauren recognizes that isolated survival is insufficient and develops a collective model based on cooperation. Kingsolver likewise emphasizes the importance of local communities and ecological knowledge.

SDG 12: Responsible Consumption and Production

Both novels implicitly challenge unsustainable relationships with land and resources. Environmental damage is partly produced by human practices that treat nature as an unlimited resource.

SDG 13: Climate Action

Climate change is the central ecological concern of both texts. Kingsolver uses the displaced monarch butterflies to make climate change visible, while Butler imagines its possible long-term social consequences. The novels therefore demonstrate the importance of climate action not only as environmental policy but also as a social and ethical responsibility.

From Ecological Awareness to Sustainable Futures

One of the most significant similarities between the novels is their movement from crisis toward the possibility of transformation. *Flight Behavior* does not offer an easy solution to climate change. Instead, it emphasizes awareness. Dellarobia's transformation suggests that recognizing environmental reality is an essential first step toward action.

Parable of the Sower goes further by imagining the creation of an alternative community. Lauren's Earthseed philosophy proposes adaptation, cooperation, and collective responsibility. The difference between the novels can therefore be understood as a difference in narrative scale. Kingsolver focuses closely on an individual woman's awakening within a local community, while Butler expands the narrative toward the reconstruction of society. Nevertheless, both writers reject passivity.

Dellarobia learns to question the world she has inherited. Lauren learns to build the world she believes may be possible. This distinction is central to the novels' visions of sustainable futures. Sustainability is not represented as a return to an idealized past. Instead, it requires new ways of thinking about relationships, resources, communities, and responsibility.

Conclusion

Barbara Kingsolver's *Flight Behavior* and Octavia E.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Butler's Parable of the Sower demonstrate the capacity of contemporary American literature to transform climate crisis into a question of gender, justice, identity, and social responsibility. Through Dellarobia Turnbow and Lauren Olamina, both novels place women at the centre of environmental transformation and challenge the assumption that ecological crisis can be separated from social inequality. In *Flight Behavior*, the displaced monarch butterflies function as a powerful ecological warning. Their unexpected migration reveals the instability of natural systems while simultaneously initiating Dellarobia's transformation. Her growing ecological awareness enables her to question the gender, economic, and social structures that have limited her life. Kingsolver therefore connects environmental consciousness with female agency. In *Parable of the Sower*, Butler presents a more extreme vision of ecological and social collapse. Climate instability, water scarcity, poverty, violence, and displacement transform the United States into a landscape of insecurity. Lauren's hyperempathy makes her particularly sensitive to the suffering produced by this collapse. Rather than treating her sensitivity solely as weakness, Butler transforms it into a source of ethical awareness. Through Earthseed, Lauren develops a philosophy based on change, adaptability, and collective responsibility.

An ecofeminist reading reveals that the novels' environmental crises are inseparable from systems of domination. Women, marginalized communities, and the natural world are repeatedly exposed to forms of exploitation that arise from hierarchical structures. The novels challenge these structures by presenting alternative forms of knowledge, agency, interdependence, and community. The two novels also demonstrate that sustainable development cannot be reduced to environmental conservation alone. Sustainable futures require social equality, gender justice, economic responsibility, community participation, and ecological awareness. In this respect, the novels resonate strongly with the Sustainable Development Goals, particularly SDG 5, SDG 10, SDG 11, SDG 12, and SDG 13. Ultimately, Kingsolver and Butler use women's experiences to reveal that environmental crisis is also a crisis of relationships. The future depends upon how human beings relate to one another and to the non-human world. Dellarobia's awakening and Lauren's community-building suggest two complementary stages of transformation: first, learning to recognize ecological change, and second, learning to live differently within it. Their journeys demonstrate that sustainable futures require not domination but interconnectedness, not denial but awareness, and not isolated survival but collective responsibility.

Acknowledgement
The authors would like to express their sincere gratitude to Mar Gregorios College of Arts & Science, Chennai, for providing the academic environment and institutional support necessary for the completion of this research. We are deeply thankful to our colleagues, teachers, and well-wishers for their valuable encouragement, constructive suggestions, and intellectual support throughout the preparation of this paper.

Abstract:

This paper draws attention to the urgent need of building Cognitive Infrastructure along with the physical infrastructure for rapid development of the country. India is rapidly transitioning from developing economy to a developed economy unleashing many forces of rapid development and growth. The quest for ***Vikasit Bharat @2047*** *(India as a developed country) requires building the foundational cognitive-intellectual infrastructure and not just physical infrastructure. The development of the human capital with higher cognitive abilities capable to create, add and transact value through knowledge creation and utilisation. Continual innovation is critical for sustainable growth and development. Innovation is a direct outcome of the quality of the cognitive infrastructure. Nations compete on the strength of their cognitive infrastructure and not just on the availability of natural resources. Cognitive infrastructure is the most critical factor of production. To build a high-quality competitive cognitive infrastructure we need new ways of acquiring and utilising knowledge. Without cognitive abilities people cannot become knowledge workers to lead the cognitive shift happening all over the world in this age of Artificial Intelligence (AI). The race is now cognitive in nature and those nations with robust cognitive and physical infrastructure will be the leaders. India has to focus on developing the cognitive capital of the aspiring youth equipping the with cognitive abilities to respond to what is coming. The uncertainties caused by technological disruptions and geopolitical shifts are overwhelming. True security comes from building an ever-expanding and renewed cognitive infrastructure which is free from the laws of diminishing returns. This paper explores the need to take a fresh perspective of the emerging realities such as the shift from computing to cognitive, and recommends building futuristic cognitive infrastructure along with the physical infrastructure for realising the goal of Vikasit Bharat @2047. One core concern highlighted is the linguistic development as human development is fundamentally the cultivation of cognitive capacity—and language is one of the most powerful instruments for that cultivation.*

Key words: *Cognitive capital, knowledge, economy, value creation, growth and development, equality of opportunity, innovation, cognitive infrastructure, Vikasit Bharat @2047*

Introduction:

From time immemorial Bharat has always been thirsty for knowledge and truth. Ancient India was a land of sages and seers as well as a land of scholars and scientists. Ancient India functioned as a vibrant knowledge society where learning (*vidya*) and practical skills (*kala*) formed the core of civilization, seamlessly integrating science, philosophy, and ethics. Every aspect of life was embraced by knowledge. Ancient Bharat's Gurukul system, oral traditions and transnational universities contributed significantly to the shaping of modern science. There was a highly evolved distinct Bhartiya Knowledge System which is now being rightly revived in earnest spirit. Key domains such as philosophy and metaphysics, science and mathematics, arts, language and governance amongst others were well evolved with rich knowledge text. Knowledge was developed and organised through indigenous interdisciplinary inquiry, dialogue, experiential learning and practical application. One most important factor we see in ancient India is the profound development of the Sanskrit language which provided cognitive resources for human critical thinking and creativity to empower the mind to reach what great thinkers like Nani Palkhivala called

Website: https://bnir.us

"the summit of thought." Bharat's rich knowledge traditions gave people enduring robust civilisational confidence. Language is the most critical instrument in building a knowledge society. While the English language has come to dominate as a library and link language to a language of high economic value due to historical and modern reasons; we urgently need to make our own languages "Knowledge languages" to enable our masses to access, acquire and utilise knowledge gainfully. We need to democratise knowledge and that cannot be done only through the English language. Disparity of knowledge is more harmful than economic disparity. How our common farmers in rural areas take benefit of the agriculture research if it is in English and not in his own language. Here we realise that we need to even utilise our local dialects as instruments of knowledge acquisition and utilisation. There are speakers of dialects in India larger than the population of many European countries. Today's India is rapidly transitioning to from a developing economy into a developed nation by 2047—**Viksit Bharat@2047**—the traditional focus on expanding physical infrastructure (roads, ports, and grids) must be paired with building **cognitive infrastructure.** Cognitive infrastructure refers to the collective brainpower, intellectual capacity, analytical frameworks, and mental well-being of a nation's citizenry. It encompasses how a society learns, critically evaluates, innovates, and adapts to complex technological shift. In an era dominated by Artificial Intelligence, advanced automation, and knowledge economies, physical assets are only as effective as the human intellect driving them. The key goals are multi-layered aspiring to radical restructuring of every aspect of life reaching out to the aspirations of the over 150 crore people for a better quality of life and well-being. One can say that the vision of Vikasit Bharat is ingrained in the very spirit of the Constitution of India wherein **"WE, the People of India**" aspire to build an India where there is equality of opportunity, no discrimination whatsoever and there is all arching goal of building a society that is based on liberty, equality, fraternity, and justice. The mandate of the Constitution as encapsulated in its Preamble is to build a welfare nation-state and it demands a total and radical renewal at all levels. While aspiring to be a $30 trillion economy by 2047, the year India will be celebrating its centenary year of independence, some of the key transformative goals of Vikasit Bharat @2047 are: Developed economy, zero poverty, High Per Capita Income ensuring better quality of life, Quality Education & Healthcare, Infrastructure Development, Technological Leadership driving innovation, Self-Reliance (Aatmanirbharta), Environmental Sustainability, Good Governance, Global Leadership embodying the lofty values and ethos of this ancient land, and highest ethical standards in governance to strengthen the socio-political life and institutions.

Some of the key pillars for Vikasit Bharat @2047 are:

1. **Empowered Youth (Yuva):** Through right values, attitudes knowledge and skills. Educational reforms in through the New Education Policy 2020, quality updated education to adapt to changing technological and economic landscape, skills development for employability and entrepreneurship, digital empowerment, start up and innovation ecosystem, opportunities for civic participation and leadership roles, employment generation, multi-layered knowledge acquisition and utilisation opportunities, gender equality and empowerment, safety and legal rights, leadership roles in developmental process, etc.
2. **Focus on Farmers (*Annadata*):** Special initiatives to increase the income of farmers (through better pricing, diversification, and value addition), agri-tech innovation and integration, market reforms, irrigation and infrastructure (storage and distribution), crop insurance and risk management, sustainable agriculture practices, food processing and exports, building rural agri-entrepreneurship, etc.
3. **Empowerment of the Marginalised:** Special focussed initiatives towards basic amenities for all, financial inclusion, direct benefit schemes (direct transfer of funds, etc), affordable healthcare, education and skilling opportunities, access to financial services, special initiatives for women (especially rural women) creating livelihood opportunities (for e,g, PM Mudra Yojana), and ensuring women's participation in workforce and governance, diffusion of appropriate technologies, workforce, etc.
4. **Atmnirbharta in Critical Higher Technologies:** The shifting sands of geopolitics have supply chains threatening business continuity. are weaponised, has convinced us of the need to focus on becoming resilient for strategic autonomy. Huge investments are being made in semi-conductors, chip making, rare earths, energy security, ship building, defence technologies, cutting edge technologies such as AI, etc. India has achieved glorious success in UPI payment which has been a huge enabler.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

The focus is on technology-driven governance by reducing bureaucratic cholesterol in public administration is focussed to reach out to every nook and cranny of the country. PM Gati Shakti National Master Plan, Digital India & Digital Hub Policy, Atmanirbhartra in defence technologies, Make in India & Aatmanirbhar Bharat (production-lined benefits, for example), MSME Empowerment, Development Support, Startup India & Innovation Policies, PM Viksit Bharat Rozgar Yojana (PMVBRY – apprenticeship based programs), Financial Inclusion and Direct Benefit Transfer (Janadhan Yojana, etc), Green Growth & Energy Transition Policies with a goal to become Carbon-neutral by 2070, Agriculture and Rural Development Policies (PM Kisan, PM Bima Fasal Yojana, etc), Smart Cities Mission & Urban Development Policies, amongst others.

Above details are mentioned here to emphasis to highlight the all-out efforts initiated vigorously to achieve the goal of Vikasit Bharat @2047. But there is an equally important to focus on the all-embracing cognitive infrastructure.

Why Cognitive Infrastructure is Vital for Viksit Bharat@2047

- **Transitioning from Labor-Intensive to Knowledge-Driven Growth:** India cannot reach a $30+ trillion economy solely through low-cost manufacturing. It requires high-value intellectual output, IP creation, and global leadership in cutting-edge industries.
- **Capitalizing on the Demographic Dividend:** With one of the world's youngest populations, India's youth can become a economic powerhouse only if rote learning gives way to higher-order cognitive capabilities.
- **Navigating AI and Technological Disruption:** As automation replaces routine tasks, the workforce must master non-routine, complex problem-solving, algorithmic thinking, and human-machine collaboration.

Now after taking a brief review of the Vikasit Bharat initiative let us turn to the core key challenge, we have to face as a nation-state and economy.

Core challenges facing the Vikasit Bharat @2047

The challenges facing the realisation of Vikasit Bharat is economic inequality, knowledge disparity, digital divide, skills gap exacerbating skill gaps, urbanisation pressure, agriculture distress, natural disasters, threats of climate change and global warming, governance and implementation issues, strengthening of the grass root level institutions, and many more. Indian lives both in space age and bullock cart age. This paper focuses on one of the key challenges facing India today and that is to convert human potential into human performance. India's demographic dividend is going to be short-lived and all care must be taken not to let our demographic dividend become a demographic disaster. The recent events have shown how the youth is restless. Creation of gainful, sustainable, equitable economic opportunities is the key goal. India is expected to be rapidly urban with over 60% population expected to be urban by next decade. With this background let me turn to the Knowledge-based and Knowledge-driven economies of today; and how it can substantially contribute to Vikasit Bharat @2047. This inevitably takes us to the core challenge mentioned above – converting human potential into human performance. The goal is to empower people to become knowledge workers and effective creators and creative users of knowledge to succeed in the creative global knowledge economy. Here my focus in on a core cognitive capability – linguistic capability which is absolutely critical to succeed in knowledge economy. The core argument is that people in India are increasingly lacking in linguistic competence required to derive knowledge out of information and put it to use. Language disparity crates knowledge disparity creating multiple developmental disabilities. There is an urgent need to pay attention to building the cognitive linguistic infrastructure of people to enable them to access and acquire knowledge and use it. Poor language leads to poverty of imagination. If our language is poor, we remain intellectually poor. Mere access to information is not enough, the cognitive capability of making information useful is pivotal. Poor language makes knowledge distant for people. Better linguistic competence accelerates what could be called as *"Knowledge mobility of people"*. It can be a huge developmental barrier which is not properly seen and understood with its gravity. We need to take a larger cognitive linguistic perspective of the language capability divide to understand the true nature of this problem. From a cognitive linguistics perspective, language is not merely a vehicle for transmitting thoughts—it is the architecture that constructs thought itself. Limited language means limited universe. It is an inequality of **linguistic access to knowledge**. It is important that knowledge should travel to the people **The conventional developmental model often implicitly expects:** People must acquire the dominant language to access knowledge. **The needed reverse model this paper proposes is in the direction:** Knowledge must become available in the languages through which people already understand, think and communicate. This is a major developmental philosophical shift for Vikasit Bharat @2047.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Our policy should be:
Do not merely bring people to knowledge. Bring knowledge to the cognitive world of the people. This gives is the humanitarian and developmental spirit for Vikasit Bharat @2047.

Linguistic Competence vs. Broader Cognitive Goals

Dimension	Low Linguistic Competence	High Linguistic Competence
Problem Solving	Limited to visual or immediate trial-and-error.	Enables multi-step algorithmic planning and abstract model building.
Economic Role	Bound to low-margin, routine execution tasks.	Capable of high-margin IP generation, design, and strategic oversight.
Societal Resilience	Vulnerable to misinformation and emotional manipulation.	Equipped for critical discourse, policy evaluation, and evidence-based debate.

Why Linguistic Knowledge Inequality is a great barrier that needs to urgently dealt with?
Two individuals may have equal intelligence, curiosity and motivation. But one has access to sophisticated knowledge in a language in which they can effortlessly think. The other encounters that knowledge through an unfamiliar linguistic medium. The inequality is not necessarily one of intelligence.

Making every Language (and dialect) a Gateway to Knowledge
Imagine a farmer in a remote rural region interacting with an AI-enabled knowledge platform through his own vernacular dialect.
He could ask questions about:

- agriculture,
- climate,
- soil,
- water,
- markets,
- technology,
- finance,
- entrepreneurship.

But the system would do more than retrieve information. It would help him:
understand → compare → question → decide → apply → learn.
Imagine an artisan using the same system to connect traditional knowledge with contemporary design, technology and markets. Imagine a rural student accessing educational knowledge through the language in which she naturally thinks and communicates.
Imagine local entrepreneurs, women's groups, teachers, health workers and community organisations participating in knowledge communities in their own languages.
The linguistic diversity of India would cease to be perceived merely as a challenge for technology. It could become an **infrastructure for knowledge inclusion**. **Every language can become a gateway to knowledge. Every dialect can become a pathway to empowerment.**

Transitioning from Information Users to Knowledge Communities
The next stage should not simply create more individual consumers of digital information. Human development depends upon communities that continuously learn. We therefore propose the development of **AI-enabled Knowledge Communities**.
A Knowledge Community would enable people to:

- access relevant knowledge;
- discuss and interrogate it;
- contribute their own experience;
- connect local knowledge with scientific and global knowledge;
- collectively solve problems;
- document useful insights;
- generate new knowledge.

AI could function as a facilitator, interpreter, knowledge connector and learning partner.
This creates a powerful transition:

Individual Knowledge Access → Collective Knowledge Intelligence
Such communities could eventually operate around agriculture, education, entrepreneurship, crafts, environmental sustainability, local governance, technology and many other domains. A Knowledge Society is not simply a society with abundant information. It is a society whose people and institutions possess the capacity to continuously acquire, process, share, create and utilise knowledge.

Cognitive Infrastructure for a Knowledge Society
This vision requires a new conception of infrastructure. We commonly think of infrastructure in physical, digital and economic terms.
We propose adding:

Cognitive Infrastructure:
Cognitive infrastructure comprises the capacities and systems that enable people and communities to:

- understand;

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

- reason;
- question;
- learn;
- create;
- solve problems;
- and utilise knowledge.

Language is one of its most fundamental components in building the cognitive infrastructure for inclusive knowledge society for Vikasit Bharat @2047. Irt leads to a developmental architecture:

Linguistic Capacity
↓
Cognitive Capacity
↓
Knowledge Capacity
↓
Innovation Capacity
↓
Development Capacity

Building cognitive infrastructure is therefore not an educational luxury. It is foundational to creating a modern Knowledge Society. Sadly, various surveys such as Pratham show a sad linguistic plight of our school students who are lacking even in basic reading and writing skills and these are not merely study skills but life skills. Given the rapid pace of disruptive technological change and the reality that knowledge also depreciates – huge knowledge becomes obsolete soon; people will have to become lifelong learners to adapt to the changes and this requires linguistic competence to become autonomous self-learners. And here the threat of linguistic competence disparity creates a threat of knowledge disparity which will result into socio-economic disparity. Lack of linguistic competence could become a direct cause of lack ability to access of economic opportunities. That is why we need to focus in mission mode on building linguistic competence of our children from early years. Neurobiological research has shown that the first six years are most critical for cognitive development wherein over 85% brain is formed and this window of opportunities must not be lost. In this era of "Brain-based Cognitive Education" and work for the brain development. Language is the diet of the brain and early years as the best years to build the cognitive linguistic developmental foundation which will be decisive in the child's future academic and real work life success. Disparity starts with disparity in linguistic competence. Sadly, this aspect is largely ignored. Every year the academic cognitive load increases with every next standard but language development lags behind creating cognitive deficit. During the Covid period this linguistic-cognitive deficit was seen in most of the students which persisted for years. Language deficit leads to cognitive deficit which cause intellectual inadequacy and learning difficulties bordering on disability. The problem is not lack of intelligence but lack of language acquisition opportunities. Lack of linguistic-cognitive abilities create barriers to become an effective, autonomous knowledge workers in the age of AI.

Equality of Opportunity Through access to Knowledge

The ultimate purpose of the cognitive infrastructure is not mere technological. It is human and developmental. Equality of opportunity increasingly depends upon the ability to access and utilise knowledge. Two individuals may possess similar intelligence and aspiration but experience radically different opportunities because one can access the knowledge required to act while the other cannot. Language is differentiator- a great predictor and indicator of one's potential and performance. Dana Siskind's research under her "30 million Words" initiative showed that vocabulary knowledge plays a critical role in intelligence development and higher IQ. Low level vocabulary directly means low IQ and exposure to language-rich learning environment is a great differentiator. All knowledge in the world is stored in words; more words a child knows, more he can receive, retain and produce. Communication skill sits on the shoulders of the language and in professional education higher language acquisition goes largely ignored. AI agents, social media, etc have adversely impacted reading and thinking skills. It is not always intelligence – both nature (genes) and nurturing is vital. Strengthening the linguistic cognitive infrastructure right from early years is vital. Knowledge is easy when language is strong. There is an urgent need to include educational neuroscience at levels of education, especially early years to high school education.

Therefore: **Knowledge inequality can become opportunity inequality.**

And: **Linguistic inequality can become knowledge inequality.**

Consequently: **Knowledge democracy requires linguistic access to knowledge.**

If knowledge is power, then equitable access to knowledge is a means of democratising power. This connects the technological vision with the foundational democratic values of: **Equality. Liberty. Fraternity.** A knowledge-empowered citizen is better positioned to exercise freedom, participate meaningfully in society and contribute to collective development.

India as a Global Cognitive Laboratory

India offers an extraordinary environment in which to explore this vision. It combines:

- enormous linguistic diversity;
- large rural and semi-urban populations;

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

- rich traditional knowledge;
- rapidly expanding digital connectivity;
- a major technology ecosystem;
- an enormous young population;
- and a growing AI ecosystem.

India could therefore become a laboratory for a new model:
AI + Linguistic Diversity + Knowledge Communities + Cognitive Empowerment
A successful Indian model could subsequently be adapted to other multilingual and linguistically diverse societies across Asia, Africa and Latin America. The ambition is consequently not merely: **Knowledge for India but for the whole world.**
We are inspired by the universal ideal of "**Vaisudhaiva Kutumbkam** – Whole world is our family. An Indian experiment in building a globally scalable model of Knowledge Democracy on the foundation of an inclusive and participative cognitive infrastructure. Thus, there is a shift from "Information Infrastructure to Knowledge Infrastructure" profoundly facilitated by the massive far reaching cognitive infrastructure.
This paper envisages a new knowledge-society paradigm as shown below:
Information access → Knowledge access
Search → Understanding
Information retrieval → Knowledge discovery to solve problems
Translation → Cognitive localisation
Individual users → Knowledge Community
Information consumption → Knowledge utilisation
Digital inclusion → Cognitive inclusion
AI assistance → AI-enabled learning and knowledge acquisition
Data accumulation → Knowledge creation
Technology adoption → Human empowerment
The larger transition is: From an Information Society to a Knowledge Society.
And eventually: From a Knowledge Society to a Knowledge-Creating Society**.**

A new developmental perception: Every Person as a Knowledge Worker
In this perspective we have to turn to the wealth of our dialects. India's culture and civilisation reside in its vast stock of dialects. Reaching out to the masses with empowering and liberating knowledge can happen quickly in the mother dialects.

Our dialects as knowledge bridges
This paper argues that dialects are not deficient languages and can serve as a bridge with their great power to become instruments of bring people and knowledge together. People will be able to access and acquire knowledge quickly, adapt to their immediate context of life and use it to solve problems and localised find solutions. India speaks dialects and not just the standardised versions of languages. Let knowledge be a heart-to-heart talk for our masses.
Dialects are frequently treated as linguistically inferior because they may lack:

- standardised technical vocabulary,
- formal educational status,
- extensive written literature,
- institutional recognition.

But the absence of modern technical terminology does **not** imply the absence of cognitive capacity.

A dialect may possess:

- sophisticated ecological knowledge,
- agricultural wisdom,
- social concepts,
- metaphors,
- classifications,
- oral narratives,
- local problem-solving traditions.

The challenge is therefore not to abandon the dialect. The challenge is to **extend its knowledge-carrying and disseminating, diffusing capacity**. We need to have policies to move from "**Dialect Preservation" to "Dialect Knowledge Empowerment."** Dialects should be studied not as an academic pursuit but as bridges to reach out to masses with appropriate knowledge.
Most language initiatives tend to focus on:

- preservation,
- documentation,
- literature,
- cultural identity.

All are important. But time has come for **the transformation of linguistic varieties into active instruments of knowledge access, acquisition and utilisation.** A dialect should not merely be preserved in a museum of linguistic heritage. It should be empowered to participate in the knowledge economy of today and in the future. Exploring and exploiting the knowledge-connectivity power of our great number of dialects, with help of AI, we can unleash their cognitive power and create a very powerful knowledge force to build rapidly far reaching and inclusive cognitive infrastructure for Vikasit Bahrat @2047.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

From Translation to Knowledge Empowerment:
India has taken various initiatives for translating and knowledge-strengthening Indian languages. The National Knowledge Mission had National Translation Mission. It was declared that India needs lakhs of translators as knowledge workers. But the efforts we half-hearted and did not yield good results.
As a nation-state we are great in planning but extremely bad in execution. The proposed initiative goes beyond conventional translation. Translation changes the language of information.
Knowledge empowerment changes the **relationship between people and knowledge**.
Let us see the difference.
Conventional approach:
English knowledge
↓
Translation
↓
Local language content
Proposed approach
Global knowledge
↓
AI-mediated linguistic access
↓
Cognitive understanding
↓
Local contextualisation
↓
Dialogue and questioning
↓
Application
↓
Community knowledge sharing New knowledge creation

The objective is therefore:
Not merely to translate knowledge, but to make knowledge cognitively accessible, usable and generative. This paper proposes the concept of: **Cognitive Knowledge Localisation.**
This would combine linguistic intelligence, contextual understanding, AI and community participation to make knowledge meaningful and usable within the lived worlds of diverse linguistic communities.

AI creates a historic opportunity for knowledge economy in India.
Creating knowledge supply chains and repositories through translation of knowledge text. We have taken translations of knowledge texts from various domains to make global knowledge accessible to our people in their own languages. Not the next step is to make the appropriate much needed knowledge available in dialects for rapid adaptability. We can see an extraordinary convergence between the intellectual vision of Vikasit Bharat @2047 and contemporary technology. For the first time, AI potentially makes it possible to imagine knowledge translation and adaptation at enormous scale. But translation alone is insufficient. Suppose advanced agricultural knowledge is translated literally into a dialect. The result may still be cognitively inaccessible.

What is needed is:
Knowledge Translation to Knowledge Adaptation (Converting language).
Making concepts understandable within the cultural and experiential world of users. And here we can use dialects with great power. **Knowledge Localisation (**Connecting knowledge with local realities.) **Knowledge Cognition (**Presenting knowledge in forms that enable people to understand, question, apply and innovate). This is far more sophisticated than conventional machine translation.
This process could be called as "**Cognitive Knowledge Localisation."**
Let us take an example. Imagine the transformational possibilities. Consider a farmer who primarily thinks in a local dialect. Imagine that person being able to interact conversationally with an intelligent AI system in that dialect and ask:

- Why are my crops developing this disease?
- What can I do about water scarcity?
- Which alternative crop is suitable for my soil?
- How can I improve productivity?
- What are the current market opportunities?

But the truly transformational step comes next. The system should not merely *answer*.
It should help the people:

- understand,
- compare options,
- ask further questions,
- evaluate alternatives,
- apply knowledge locally.

That is **knowledge empowerment**. And this is basically a cognitive linguistic challenge demanding building cognitive infrastructure. The same model could apply to:

- farmers,
- artisans,
- women entrepreneurs,
- small businesses,
- students,
- local administrators,
- healthcare workers,
- fishermen,
- tribal communities.

This is how AI could become an instrument of **cognitive inclusion**, rather than merely technological sophistication.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Knowledge is not truly available to a person merely because it exists somewhere. Knowledge becomes available only when a person can access, understand, interrogate and utilise it.

Therefore: :**Knowledge democracy requires linguistic democracy. If knowledge is power, linguistic access to knowledge is empowerment.** This connects everything:

- concern for language development,
- cognitive infrastructure,
- knowledge society,
- AI,
- continual innovation,
- equitable development,
- Indian languages and dialects.
- mentors turn basic science into patents and commercial startups.

Institutionalize Lifelong Upskilling and Cognitive Agility

The Strategy: Build flexible learning pathways where workers continually adapt their skills alongside technological evolution, removing the binary divide between education and work.

- **Example:** Expanding platforms like **SWAYAM** and integrating modular credit banks (Academic Bank of Credits) so mid-career professionals can earn industry-aligned micro-credentials in emerging fields like green hydrogen technology or generative AI without leaving the workforce.

Bridge the Cognitive and Digital Divide Across Demographics

- **The Strategy:** Democratize access to quality educational tools, logical training, and digital literacy in rural areas and underserved communities to ensure inclusive human capital development.
- **Example:** Leveraging tech-driven public infrastructure like **PM e-VIDYA** and **BharatNet** rural connectivity to deliver interactive STEM education and digital literacy toolkits in regional languages.

To achieve the target of **Viksit Bharat@2047**, India's transition depends not just on physical capital, but on the quality of its human capital. Cognitive abilities—specifically **language proficiency, critical and creative thinking, and problem-solving skills**—serve as the foundational engine for this transformation.

Without these core mental faculties, physical infrastructure remains underutilized, and technological tools cannot reach their full economic or societal potential. Here we need to realise the following key points:

Language Abilities: The Gateway to Knowledge & Global Influence: Language is the cognitive substrate through which complex thought is structured.

1. **Democratic Participation and Policy Execution:** Clear communication reduces information asymmetry. For micro-entrepreneurs, farmers, or tech workers, language proficiency ensures they can navigate digital platforms, understand legal frameworks, and negotiate contracts effectively.
2. **Cogni-linguistic infrastructure - the Engine for Knowledge Transfer and Democratic Participation:** Linguistic competence acts as the highway system over which information travels across an economy.
3. **Lowering Information Asymmetry:** High linguistic competence allows citizens to comprehend public policy, navigate legal rights, and engage with financial tools without relying on intermediaries.
4. **Vikasit Bharat @2047: The power to compete with knowledge**

Recommendations:

- Rightly said, "If we don't compete with knowledge; we don't compete at all!" Peter Drucker said, *"Knowledge is and will be the basic economic resource."* India's legendary scientific mind Prof. CNR Rao, the Bharat Ratna said, "Today's knowledge is tomorrow's wealth."
- AI is now a powerful bridge between the "Bullock cart age India" and the "Space Age India."
- Focus on early childhood education – If we fail in our schools, we stand no change to succeed anywhere. There are critical axioms for early childhood education and development such as earlier is better because earlier is easier, parents are teachers too, preparing is better than repairing, given the highest possible brain development happening during the early years, it is using the brain or lose it, Knowledge is easy with language is strong, etc.
- Utilising mother tongues to make them knowledge language is critical. Translations to create knowledge assets and build knowledge repositories could be strategic initiative to make knowledge accessible to more and more people on the wings of IT and AI.
- Every complex system is essentially knowledge-based there is cognitive interdependence at the infrastructural scale--how social systems come to rely on recursive, collectively sustained knowledge stacks whose maintenance is decentred, distributed, and increasingly fragile. We live not in a knowledge economy, but inside a cognition infrastructure--a

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

condition where intelligence is no longer merely human, but organized recursively through symbolic, material, and institutional enclosures.

- The rise of GCC shows how complex systems source out knowledge from delegated multiple layers of social hierarchies spread all over the world. An Apple smart phone has components sourced out from many cognitive infrastructures and is a global cognitive phenomenon and a cognitive product of global cognitive delegation and cognitive integration. GCCs pull cognitive infrastructures going beyond the sovereign boundaries of nation-states and solving problems. We have to realise that knowledge infrastructures are created by cognitive infrastructures which become accessible and usable through various physical infrastructures.
- If a social group or community lacks the power of cognitive infrastructure then it cannot participate at higher level but will be condemned to remain at the bottom of the pyramid of value creation and thus lag behind. Those who are deprived of cognitive development opportunities by denying them education and empowerment are cognitively deprived and as they lack cognitive infrastructure, they are marginalised and thus cannot take or receive benefits of the cognitive revolution delivering greater opportunities.
- The way youth are opting out of higher education as seen in Maharashtra is frightening and has far-reaching consequences. They don't see any substantial return on investment on their higher education which are not creating economic opportunities for them. They will be trapped at bottom of cognitive pyramid.

Conclusion

We speak endlessly about:

- physical infrastructure,
- digital infrastructure,
- financial infrastructure,
- educational infrastructure,

but rarely about the **cognitive infrastructure of a people**.

A Knowledge Society cannot be built merely by providing people with access to information. It must build their capacity to linguistically access, cognitively process, critically evaluate and creatively generate new knowledge and creatively put to use for continual innovation. Information access does not automatically produce knowledge. Knowledge requires the capacity to understand, interpret, question, evaluate, connect, contextualise and apply information. The proposed initiative therefore rests on a simple progression:

Information → Understanding → Knowledge → Cognitive Empowerment → Innovation → Human Development

We can identify a chain of the whole process here as:

Language → Access to Knowledge → Cognitive Processing → New Understanding → Innovation → Value Creation → Problem Solving

A Knowledge Society cannot be built if knowledge remains linguistically inaccessible to large sections of its people. India does not merely have a language diversity problem. It has a knowledge-access opportunity. We must strengthen our indigenous languages as knowledge languages. This way we can achieve the democratisation of cognitive capacity across an entire society to build Knowledge Society India as a bedrock for Vikasit Bharat @2047. Our ultimate goal is to build a knowledge society for Bharat. The Knowledge Society is not a society in which a few professionals possess more knowledge. It is a society in which every individual has the opportunity and capacity to access, understand, utilise and create knowledge. Economic inequality limits what people possess. Knowledge inequality limits what people are able to understand, imagine, create and become.

We have to utilise our dialects as knowledge pathways – treating them as knowledge supply chains powered by AI to build the knowledge delivery logistics for constructing the cognitive infrastructure for knowledge access, acquisition and creative utilisation thereby bridging the linguistic and consequent knowledge gulf and divide. We must realise that if we want to affect the rapid, across the country knowledge transition of our society then it has to be in the languages and their dialects of our people- through the cognitive-linguistic infrastructure which we need to build on war footing. We have to go for linguistic harmony and not uniformity in form of one language – mostly the English language. The widespread AI needs to be leveraged effectively. People, especially the youth must cultivate critical thinking and not become dependent on AI agents and other tools to source out thinking. A nation of critical thinkers always survives and thrives and not those who stop using their brains to think. Technology expands capabilities, but intelligence sharpens judgement. India already has a vast universe of languages and a great number of dialects. This is a huge, rich and inexhaustible cognitive capital that will never depreciate. We need to empower our languages and even dialects as instruments of accessing and cognitive processing knowledge to build and continually cognitive infrastructure. Bharat's destiny is "Knowledge." The very meaning of the name Bharat is "*Bha* **(Baa)**- knowledge and "*rat* (**rta)**

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

- the one engrossed in it"- this *"Bharat is the one immersed and engrossed in knowledge."* Knowledge empowers and liberates. Knowledge creates inexhaustible innovative opportunities. We are better placed with our humungous cognitive capital to rise as a knowledge super power in this age of AI. Developing the cognitive capacity of the people—and simultaneously democratise their access to knowledge is the key challenge. We can do it very well as a determined nation-state and a as a great knowledge-driven civilisation. Let us move ahead with that active faith with a grand and glorious civilisational vision on our quest for the Vikasit Bharat @2047.

Abstract-

Brick's manufacturing is an important industry in India. Bricks are very important raw material required in construction. Thousands of construction projects are ongoing in Mumbai Economic zone and thane district. Bricks manufacturers in thane district are primary suppliers of bricks to these construction sites. Large number of tribal communities from thane district are engaged as bricks worker in Bricks manufacturing Industry. These Tribal Brick workers play an important role in the construction industry, providing the foundation for buildings, homes, and other infrastructure projects. Despite their significant contribution, they have very challenging lives. Harsh physical labour, prolong working hours, and limited resources is an everyday issue for these workers. These tribal workers have lack of formal education, which limits their employment opportunities outside the brick industry. These workers Often employed on a seasonal basis, with very low wages, long working hours, and. Due to illiteracy and poor economic condition times, they often exploited by their owners. This article will focus on the working and living conditions of brick workers in the Thane district. This research aims to understand the socio-economic status and problems, occupational health issues, and the impact of their work environment on their overall well-being of Tribal Bricks Wokers. This paper is going to focus on the problems and possible remedies to address the various issues of Tribal Brick Workers. This research will be helpful to the broader discourse on informal labours problems and provides a foundation for policymakers and social organizations to address the challenges faced by brick workers.

Keywords- *Tribal Bricks worker, Thane, forced labour, Child labour, health issues, occupational Issues.*

Introduction:

Millions of marginalized people in India rely on the informal sector, which employs a sizable portion of the nation's unskilled and semi-skilled work force. The brick kiln business is one of the biggest, oldest, and most labor-intensive seasonal enterprises in this disorganized terrain. The sector is significantly dependent on a highly vulnerable labor that is nearly entirely recruited from landless, rural, and indigenous (tribe) communities, despite its substantial contribution to metropolitan infrastructure and real estate expansion. The peril-urban and rural hinterlands of the Thane district in the state of Maharashtra provide as a striking example of this dynamic. Thane district is home to a sizable population of Scheduled Tribes (STs), primarily the Katkaris, Warlis, Malhar Kolis, and Thakars. Despite being close to financial center Mumbai and seeing significant industrialization, due to environmental deterioration, changes in regulations, and commercial growth, these tribal communities who have historically relied on forests and subsistence farming have experienced systemic alienation from their customary landholdings and natural resources. Thousands of tribal families are driven into seasonal distress migration during the post-monsoon dry months due to severe food insecurity and localized structural unemployment. The hundreds of brick kilns that dot the rural landscapes of talukas like Bhiwandi, Shahapur, Murbad, and Kalyan is the direct result of this yearly migration.

Website: https://bnir.us

This research paper aims to recognize the socio-economic realities, migration patterns, occupational health hazards, and structural exploitation faced by tribal brick kiln workers in Thane district. By evaluating the gaps between existing welfare policies. there are some provisions like the Inter-State Migrant Workmen Act, the Bonded Labour System Abolition Act, but their ground-level execution should be examined. This study aims to provide actionable, evidence-based recommendations to secure the labors rights, dignity, and sustainable development of Thane's tribal Brick kiln workers.

Objective of Study-

1) To study the Present status of Tribal Brick workers in Thane district
2) To study the social condition of Tribal brick workers, form Thane district.
3) To study economic condition of Tribal Brick workers, form Thane district.
4) To analyse Government Schemes for Tribal Brick workers.

Research Methodology: Primary and secondary Research conducted to study the Condition of Tribal Brick workers from Thane district. Interviews of some tribal brick workers was conducted. Data also collected through the secondary sources e.g. published articles, journals, newspapers, reports, books and websites.

Social and Economic problems face by The Tribal Brick Workers-

Once at the kilns, these Tribal workers encounter severe systemic vulnerabilities:

- **Unhuman Living Conditions:** These Tribal Families resides at their worksite in temporary, cramped mud-and-thatch shacks lacking access to basic facilities like drinking water, electricity, or sanitation facilities. They have to resides there for almost 7 to 8 months, without basic facilities required in day to day life.
- **Severe Health Hazards:** Regarding health there is no proper care is been taken to protect the health of these Tribal brick workers. They are expose to unprotected extreme heat, heavy smoke, and silica dust for prolong time without any protection. Which leads to pervasive respiratory illnesses, chronic musculoskeletal disorders, and dermatological infections. Health of workers is affected due to conditions they work under. The older age group had more respiratory, dermatological and ophthalmic complaints. The group of workers employed as bigaaris as well as those who were working for more than 10 years had more respiratory and dermatological complaints.[1]

Generational Educational Interruption: Every year seasonal migration of parents, uproots their children from local Zilla Parishad schools, driving high dropout rates and giving rise to child labor, which effectively traps the next generation in the same cycle of poverty. In thane district number of school dropout students majorly compose children of tribal brick workers. Children from this migrant community remain perpetually deprived of education. While they attend village schools in June, they leave with their parents for the brick kilns after Diwali. As a result, their educational path remains disjointed and irregular. A 'Sakharshala' (Sugar School) scheme was launched for the children of sugarcane cutters in the Ghat region. Along similar lines, the government had initiated 'seasonal settlement schools' for the children of migrants at these brick kilns. However, due to widespread irregularities in the operation of these schools, they have been shut down in several locations. Consequently, these children are often seen working alongside their parents at the kilns.[2]

- **Addiction-**

Addiction of Alcohol and Tobacco is a biggest problem for these Tribal workers. Almost more than 90 % Bricks workers are addicted to liquor consumption. Liquor Addiction just not only triggers the health issue but also create social and economic problems. Due to economic condition these tribal brick workers consume locally made Liquor. This liquor is cheap, unhygienic, and many times made with toxic material. Because of this mortality rate is higher in tribal brick workers, alimentally leaving families in economic distress.

Exploitation is biggest issue for these Tribal Brick workers. Brick Kiln owners always exploit these workers though various ways.

Labor Exploitation:

Workers routinely worked for almost 12-to-14-hour a day, structural underpayment, and a complete absence of social security benefits, formal contracts, or institutional legal protections. While existing literature extensively covers migration and informal labor in India, regional dynamics vary significantly. Thane

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

district presents a unique socio-economic paradox: it is an area where high-growth urban industrialization directly coexists with severe indigenous deprivation. A married couple working at kiln is referred to as a 'Patli' in rural areas. The major problem regarding these workers is that family which is called as Patli is consider as one unit regarding payment. Instead paying day basis or monthly salary., They get their wages on the numbers of bricks they manufacture in a day. There rate is calculated per thousand bricks they manufacture in day. As family consider as one unit and wage is decided on the number of bricks manufactured, their economic exploitation is at pick compare to the other sector.[3] Most brick kiln owners pay an advance for the coming year to these couples when they return home in May. Consequently, even if they find local employment, they are compelled to return to the brick kiln. If anyone refuses, the kiln owner may resort to coercion or oppression; several such incidents have come to light.[4] Work at the brick kiln requires rising at the crack of dawn. Even during the biting cold of November through January, the work—mixing mud, molding bricks, stacking the kiln—must be performed while standing all day long. In return, since an advance payment was already taken from the owner, they receive only a meager weekly allowance for daily expenses. Household supplies are purchased with this money. However, as addiction is prevalent among both husbands and wives in this community, a significant portion of their hard-earned money is spent on intoxicants.[5] One more problem is been that many time agents are appointed by the Brick kiln owners to look open the labours as their supervisor, but many times these supervisors are responsible for Physical and economic exploitation of the labours.[6]

Harassment and Atrocities:

Harassment and atrocities are regular practice in Bricks kiln site. Tribal workers suffered heavily due this harassment. There are several incidents are recorded in thane regarding atrocities against the Tribal workers.

In December 2023 tribal activists have rescued a total of 11 bonded labourers, including nine women, along with their dozen minor children, from a brick kiln in Chimbipada, Bhiwandi. All of them were living in deplorable conditions in their huts. These victims belong to primitive tribes from various talukas in Thane and Palghar districts. Some of these labourers had been enslaved at the brick kiln for the past 10 years without receiving any daily wages, while others were paid Rs 600 a week for working 10 to 12 hours a day at Siddhik Hussain Shaikh's heavily polluted brick kiln factory.[7] In January 2025 a case had registered against a brick kiln owner for allegedly beating up a couple working him in Maharashtra's Thane district, police said on Sunday. Based on a complaint lodged by the couple, Police registered a case under different sections and Prevention of Atrocities against Schedule caste and schedule Tribes Act. Victims want to meet their daughter, but accused don't give them permission. When they escaped, he intercepts them and drag back them to the kiln, and allegedly beat them up.[8]

In dec 2023 a shocking case has come to light in the Bhiwandi area of Thane district where a couple was forced to toil at a brick kiln for eight years over a sum of just five thousand rupees. A case has been registered at the Bhiwandi Taluka Police Station, and the police are searching for the accused. Previously, incidents involving the sale of tribal children for ₹500 to ₹1,000 and their subsequent exploitation in bonded labor had also been exposed in the district. These events have brought the grim reality of bonded labor in the district to the fore.[9] these are some examples of the atrocities against the tribal brick workers. Several incidents certainly remain unregistered and hidden.

Government effort for upliftment of Tribal Brick Workers:

'Brick to Ink' initiative-Manuj Jindal, the then Chief Executive Officer (CEO) of the Zilla Parishad, has initiated a significant project to bring the children of migrant brick-kiln workers into the educational mainstream under the 'Right to Education' mandate in 2023. This initiative was undertaken jointly by the Zilla Parishad's Primary Education Department and the Social Empowerment and Voluntary Association (SEVA). To create awareness, a one-day workshop was organized in Bhiwandi for headmasters from 85 Zilla Parishad schools, with the cooperation of Education Officer Bhausaheb Karekar, to provide guidance for implementing this educational program. The main objective of this initiative is to bring the children of migrant laborers working at these kilns into the educational mainstream. It involves surveying the children present at the sites, enrolling them

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

in nearby schools, and ensuring they receive primary education. The initiative is implemented by the 'Seva Sanstha Thane' organization. Primaryly Targeting the Bhiwandi, Murbad, and Shahapur talukas of Thane district.[10] This 'Brick to Ink' campaign is successful in many ways. This campaign involves counselling Tribal workers families and integrating their children into mainstream education. The then CEO of Zila Parishad, Mr. Manuj Jindal, had included this scheme in the 2023-24 budget. During the 2022-23 academic year, 1,000 out-of-school children were successfully enrolled in schools through this campaign. In 2023-24 academic year, 196 out-of-school children have been enrolled, including 50 children from Bhiwandi taluka, 56 from Murbad taluka, and the highest number 90 from Shahapur taluka.

Formation of a Special Committee-

Committees at the district, taluka, and Gram Panchayat levels have been constituted to implement measures for bringing children from brick kiln-working families into the education system. These committees have undertaken various tasks, such as surveying out-of-school children at brick kilns, planning for family rehabilitation, striving to increase school attendance, focusing on improving the children's writing, reading, and comprehension skills, ensuring access to ICDS facilities, registering children under six years of age in Anganwadis, arranging for uniforms, books, healthcare, and nutrition, and seeking assistance from non-governmental organizations (NGOs).[11]

Government Welfare Schemes for Tribal Workers-

there are some governments Schemes specially design considering Welfare of tribal workers. It includes following schemes. **Khawati Loan/Subsidy Scheme:** Relaunched specifically to support tribal laborers facing economic distress. It provides **100% subsidized groceries** (grains, oil, pulses, spices) alongside cash assistance to families to prevent them from taking high-interest advances from kiln owners[12]

Thakkar Bappa Tribal Vasti Development Programme: A state scheme that funds the creation of basic infrastructure (drinking water, internal roads, sanitation) in tribal hamlets (*vastis*) so workers do not have to leave their villages due to a lack of local work.[13]

Shabari Awas Yojana: Provides financial assistance of **₹1.20 lakh** (ordinary areas) to **₹1.30 lakh** (hilly areas) to construct permanent houses with sanitation facilities, giving landless tribal laborers a stable home base. Now considering increase cost of material Assistance is almost revise upto 3 Lakh Rupees.[14]

along with this state government schemes central governments have also initiated some schemes for welfare of the workers in unorganised sectors. Some important schemes are Pradhan Mantri Jeevan Jyoti Vima Yojana, Pradhan Mantri Suraksha Vima Yojana and Recognition of Prior Learning Training.[15]

Conclusion-

Birck kiln workers in Thane district are leaving in a very Miserable state. Due to lack of education, poverty and other issues they are forced to work in this industry. But as a brick workers they have again faces many problems, health hazards like Respiratory issues, musculoskeletal disorders, skin, eye ear problems, Occupational Injuries are common for them. Poor working condition, low wages and exploitation are routine in brick kiln industry. Along with this lack of social security make problem more severe.

Possible remedies to the problems of Tribal brick kiln workers are strict enforcement of labor laws to ensure fair wages, safe working conditions, and elimination of child labor. Regular health check-ups and provision of protective gear should be made mandatory at work place. Organize Skill development Training programs to provide alternative livelihood options. To them. Inclusion of brick workers in government social security and welfare programs. Initiatives to ensure access to education for children of these tribal brick kiln workers.

Acknowledgement

I would like to express my sincere gratitude to all those who contributed to the completion of this research paper, "A Brief Study of Tribal Brick Workers: Special Reference of Thane District." I am especially thankful to the tribal brick workers of Thane district who shared their experiences, working conditions, socio-economic challenges, and occupational difficulties, thereby providing valuable insights for this study.

Abstract:

The National Education Policy (NEP) 2020 is a landmark educational reform that aims to improve academic quality through multidisciplinary education, flexibility, research, innovation, digital learning, and skill-based education. Although the policy presents significant opportunities for transforming higher education, its implementation has created several practical challenges in higher education institutions, particularly aided colleges. This paper critically analyses the impact of NEP 2020 on student enrolment, faculty workload, curriculum overload, teacher surplus, skill-based education, and the rapid expansion of private colleges. The study concludes that academic quality can be achieved only through effective implementation, institutional accountability, and quality-oriented policy decisions rather than merely increasing the number of institutions.

Keywords: *NEP 2020, Academic Quality, Higher Education, Student Enrolment, Faculty Workload, Aided Colleges.*

Introduction:

The National Education Policy (NEP) 2020 is the first comprehensive education policy introduced in India after more than three decades. It seeks to create an equitable, flexible, multidisciplinary, and research-oriented higher education system. The policy encourages Academic Bank of Credits (ABC), multiple entry and exit options, vocational education, digital learning, and continuous assessment to improve the quality of education and employability. The policy has brought structural reforms to higher education institutions. However, implementation has produced different outcomes across institutions. While some universities and colleges have successfully adopted NEP reforms, many aided colleges continue to face challenges related to admissions, workload distribution, infrastructure, faculty preparedness, and curriculum management. Therefore, evaluating implementation challenges is essential for understanding the relationship between NEP 2020 and academic quality.

Rationale of the Study

The implementation of NEP 2020 has changed the academic structure of higher education institutions. Many colleges have reported declining admissions, increasing administrative responsibilities, curriculum expansion, and uncertainty regarding faculty workload.

The study is important because:

1.Academic quality depends on effective implementation rather than policy formulation alone.
2.Aided colleges are facing declining enrolment and sustainability concerns.
3.Teachers are experiencing increased workload and surplus issues.
4.Students face curriculum overload and reduced attention to core subjects.
5.Rapid expansion of institutions requires stronger quality assurance mechanisms.

OPEN ACCESS

3. Objectives of the Study

1.To study the impact of NEP 2020 on academic quality.
2.To analyse declining student enrolment in higher education institutions.
3.To examine faculty workload and teacher surplus under NEP 2020.
4.To evaluate curriculum overload and skill-based education.
5.To suggest policy measures for strengthening academic quality.

4. Hypothesis

H1: NEP 2020 has the potential to improve academic quality in higher education.
H2: Implementation challenges reduce the effectiveness of NEP 2020 in higher education institutions.

5.Research Methodology

Research Method: Descriptive and Analytical.
Research Design: Qualitative Research Design.
Sampling: Purposive sampling of aided and private higher education institutions.
Research Tools: Secondary data collected from NEP 2020 documents, UGC guidelines, NAAC framework, AISHE reports, books, journals, and research articles.

6. Review of Literature

NEP 2020 emphasises holistic education, multidisciplinary learning, digital education, research culture, and institutional quality assurance. UGC guidelines encourage Academic Bank of Credits, vocational education, and student-centric learning. NAAC identifies teaching-learning processes, governance, research, student support, and institutional values as major indicators of academic quality.
Recent studies indicate that NEP 2020 has enormous potential to improve higher education. However, implementation requires trained faculty, adequate infrastructure, financial support, curriculum planning, and institutional preparedness.

7.Benefits of NEP 2020

NEP 2020 has introduced several positive reforms:

- Multidisciplinary education.
- Flexible curriculum and Academic Bank of Credits.
- Skill-based and vocational education.
- Digital education and blended learning.
- Research and innovation at undergraduate level.
- Outcome-based teaching and continuous assessment.
- Holistic development of students.

These reforms aim to improve employability, creativity, and academic quality.

Implementation Challenges of NEP 2020

1. Declining Student Enrolment

Many aided colleges are witnessing declining admissions after the implementation of NEP 2020. Student migration, demographic changes, and increasing competition among institutions have affected enrolment. Reduced admissions directly influence workload, finances, and departmental sustainability.

2. Faculty Workload

Teachers now perform teaching, mentoring, project supervision, internships, continuous internal assessment, documentation, value-added courses, and administrative duties. This has increased workload significantly and reduced time for research and academic development.

3. Teacher Surplus

Declining admissions in some departments reduce sanctioned workload and create surplus teachers. This affects faculty morale and institutional planning

4. Curiculum Overload:-Students simultaneously study Major, Minor, SEC, VAC, AEC, vocational, and interdisciplinary courses. Although multidisciplinary education is beneficial, excessive academic load often reduces conceptual understanding of the core subject.

5. Core Subject Learning

The multidisciplinary framework is intended to broaden knowledge, but many students struggle to develop a strong foundation in their major subject because of multiple academic requirements.

6. Skill-Based Education: Theory and Practice

NEP 2020 promotes skill development and employability. However, many institutions lack adequate laboratories, field training, industry collaboration, and infrastructure. Consequently, students often complete academic credits without acquiring sufficient practical skills.

7. Declining Interest in Regular College Education:- Many colleges report irregular attendance, reduced classroom participation, and declining interest in regular academic learning. This affects academic performance and learning outcomes.

8. Student Dropout

Financial constraints, family responsibilities, migration, lack of motivation, and curriculum pressure contribute to student dropout in several institutions.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Private Colleges and Academic Quality

The growth of private colleges has increased educational access in many regions. However, rapid expansion without adequate quality monitoring may create unhealthy competition for a limited student population.

Many aided colleges with experienced faculty and established academic traditions face declining admissions, while some new institutions attract students because of convenience or flexible admission practices.

This paper does not argue against private institutions. Instead, it recommends that recognition and expansion should be linked with measurable quality standards.

Need Assessment Before Granting Permission

Before granting permission for a new college, authorities should examine:

- Student demand in the region.
- Availability of existing colleges.
- Population and enrolment trends.
- Employment opportunities.
- Distance from nearby institutions.

Quality Audit Before Recognition

- Every institution should be evaluated for:
- Infrastructure.
- Qualified faculty.
- Library and laboratories.
- Digital facilities.
- Transparent examination and evaluation system.
- Student support services.

Discussion

NEP 2020 aims to improve academic quality, but implementation varies across institutions. Academic reforms should strengthen both access and quality.

Major implementation gaps include:

1.Unequal infrastructure.
2.Faculty shortage and workload imbalance.
3.Curriculum overload.
4.Weak implementation of skill education.
5.Institutional competition for admissions.

A balanced policy should support aided colleges while maintaining accountability for all institutions.

Findings

The study finds that:

1.NEP 2020 provides a progressive framework for higher education.
2.Declining enrolment affects aided colleges and faculty workload.
3.Curriculum overload reduces focus on core disciplines.
4.Skill-based education requires stronger institutional support.
5.Faculty workload has increased because of academic and administrative responsibilities.
6.Quality assurance mechanisms need stronger implementation.

Suggestions

1.Conduct regional Need Assessment before approving new colleges.
2.Make Quality Audit mandatory before granting recognition.
3.Strengthen aided colleges through infrastructure and academic support.
4.Balance faculty workload and avoid unnecessary surplus.
5.Rationalise curriculum without weakening multidisciplinary education.
6.Increase practical and field-based learning.
7.Improve student attendance through mentoring and experiential learning.
8.Strengthen collaboration between higher education institutions and industry.
9.Provide regular faculty development programmes for NEP implementation.
10.Ensure continuous monitoring of academic quality through NAAC and UGC frameworks.

Conclusion

NEP 2020 has the potential to transform Indian higher education through flexibility, multidisciplinary education, and quality improvement. However, successful implementation requires institutional preparedness, adequate infrastructure, trained faculty, balanced workload distribution, and effective quality assurance.

The study concludes that academic quality cannot be achieved merely by increasing the number of institutions or introducing new courses. Sustainable academic quality depends on strengthening teaching-learning processes, protecting deserving institutions, promoting skill-based education in practice, and ensuring that policy implementation responds to regional educational needs.

Abstract

Crop yield prediction algorithms are now much more accurate and useful thanks to recent developments in deep learning. In order to analyse crop yield, this study explores the combination of Random Forest methods with Generative Adversarial Networks (GANs). In order to overcome data scarcity and class imbalance, GANs are used for data augmentation, producing realistic synthetic samples that strengthen deep learning models. Various agro-climatic and soil datasets are used to forecast yield using Random Forest, an ensemble machine learning technique. According to comparative analyses, Random Forest outperforms conventional regression models and has great generalization across areas and crops4568, regularly achieving high predictive accuracy (R2 > 0.95). A potent foundation for precision agriculture is provided by the complementary application of Random Forest for prediction and GANs for data enrichment, allowing better precision in crop yield analysis. With proper hyperparameter tuning, RF can achieve very high accuracy (R^2 up to 0.99 in some studies), making it a preferred choice for practical yield forecasting.

Keywords: *Crop yield production, machine learning, environment variability.*

Introduction

Accurate crop yield prediction is a cornerstone of modern agriculture, underpinning food security, efficient resource allocation, and informed policy-making. Traditional yield estimation methods, often reliant on field surveys and statistical models, struggle to capture the complex, non-linear interactions among climatic, soil, and management factors that influence crop productivity. In recent years, the emergence of advanced machine learning and deep learning techniques has transformed the landscape of agricultural analytics, offering powerful tools to model these intricate relationships. Among these innovations, Generative Adversarial Networks (GANs) and Random Forest algorithms have shown exceptional promise. GANs, a class of deep learning models, are particularly effective for data augmentation, enabling the generation of realistic synthetic datasets that address issues of data scarcity and imbalance common in agricultural research.

is improves the generalizability of predictive models across various agro-ecological zones in addition to improving their training. Because of its resilience, capacity to handle high-dimensional data, and ability to shed light on feature relevance, Random Forest, an ensemble learning technique, has established itself as a standard for agricultural production prediction.

Researchers can use the predictive capabilities of ensemble methods and the skills of deep learning in data enrichment to produce more accurate and dependable yield estimates by combining GANs and Random Forests. With an emphasis on their respective functions, advantages, and potential to promote precision agriculture, this paper investigates the complementary use of GANs and Random Forests in agricultural yield analysis. A major step toward sustainable agriculture management and better decision-making in the face of global food production concerns is the combination of various strategies.RF models consistently outperform traditional regression methods, achieving lower root mean square errors (RMSE) — typically between 6% and 14% of average observed yields, compared to 14%–49% for linear models.

Literature Survey

Masrah Azrifah Azmi Murad and Md. Abu Jabed (2024) A thorough analysis of machine learning and deep learning techniques for agricultural crop production prediction, with recommendations for further study and sustainability This thorough analysis highlights the revolutionary effects of machine learning (ML) and deep learning (DL) techniques while methodically examining current developments in crop production prediction. The authors emphasize the expanding usage of Convolutional Neural Networks (CNN) and Long Short-Term Memory (LSTM) networks in deep learning, as well as the broad acceptance of Random Forest (RF), Artificial Neural Networks (ANN), and Support Vector Machines (SVM) for yield prediction. For precise assessment, the review emphasizes the significance of combining various environmental and agricultural data (such as temperature, rainfall, soil type, and vegetation indices).

Recent Advances in Deep Learning-Based Crop Yield Prediction Research (2024): This review highlights CNNs, LSTMs, and hybrid models as the most recent deep learning models for crop yield prediction. It talks about how deep learning can be used to extract intricate patterns from big, multisource datasets, but it doesn't go into detail about GANs or how they work with ensemble models like RF.

A Comprehensive Review of Applied Deep Learning-Based Crop Yield Prediction (2024): According to this comprehensive review, deep neural networks forecast yields more accurately than standard models, particularly for key commodities like maize and soybeans. GANs and hybrid GAN-RF techniques are not included in the paper, which instead stresses the significance of sophisticated preprocessing and data integration.

Findings from the survey

Author(s) & Year	Focus	GANs Mentioned	Random Forests	Hybrid/Integration Discussed
Md Abu Jabed & Murad (2024)	ML/DL in crop yield prediction	No	Yes	No
MDPI (2024)	Deep learning models (CNN, LSTM)	No	No	No
MDPI (2024)	Deep neural networks vs. traditional	No	No	No

Random Forests remain a leading ML method for crop yield prediction, valued for their accuracy and ability to handle diverse data.

Complex feature extraction and time-series prediction are two applications that are seeing an increase in the use of deep learning models (CNNs, LSTMs).

There is a need for more research because GANs and their integration with Random Forests have not yet received much attention in current crop yield prediction surveys.

Problem Definition

The intricate, non-linear interactions between environmental, genetic, and management factors that affect agricultural production make it difficult to predict crop yields with any degree of accuracy. Traditional statistical and expert-driven approaches often lack the flexibility and scalability required to process large, heterogeneous datasets, leading to suboptimal yield forecasts. The problem is further exacerbated by data scarcity, missing values, and class imbalance in agricultural datasets, which can degrade the performance of conventional machine learning models. There is a need for robust, scalable, and accurate predictive systems that can effectively leverage diverse data sources—such as weather, soil, and remote sensing data—to support precision agriculture and informed decision-making

.Implementation

A hybrid strategy that combines Random Forest algorithms for yield prediction and Generative Adversarial Networks (GANs) for data

augmentation can be used to overcome these obstacles:

• Gathering and Preparing Data: Compile past crop production information along with pertinent characteristics including temperature, precipitation, soil characteristics, pH, humidity, and the area being grown. To deal with outliers and missing numbers, clean and preprocess the data.

• GAN-Based Data Augmentation: Create artificial, lifelike samples using GANs that closely resemble the actual data's distribution. By doing this step, class imbalance and data scarcity are lessened, giving model training a richer dataset.

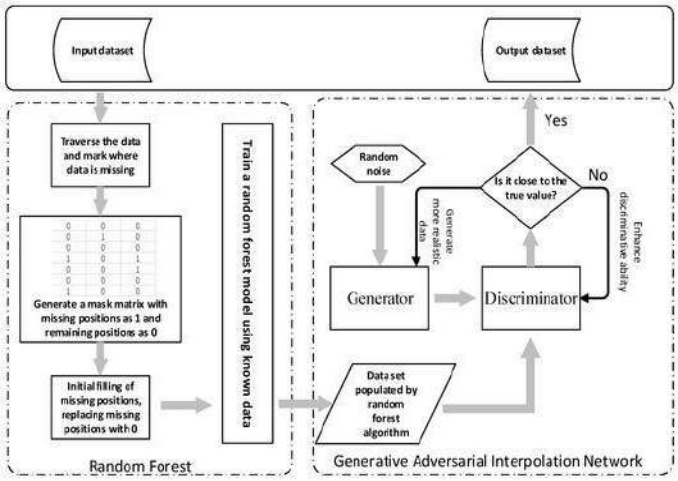
• Feature Selection: To choose the most pertinent predictors for yield estimate, use statistical techniques or Random Forest feature importance scores.

• Random Forest Model Training: Using the enhanced dataset, train a Random Forest regression model. Random Forest is selected due to its interpretability using feature importance measures, resilience against overfitting, and capacity to manage non-linear interactions.

• Model Evaluation: Use metrics like R2 score, Mean Absolute Error (MAE), and Root Mean Square Error (RMSE) to evaluate the model's performance. To verify improvements, compare outcomes with baseline models.

• Deployment: Integrate the trained model into a decision support system for real-time or seasonal yield prediction, enabling actionable insights for farmers.

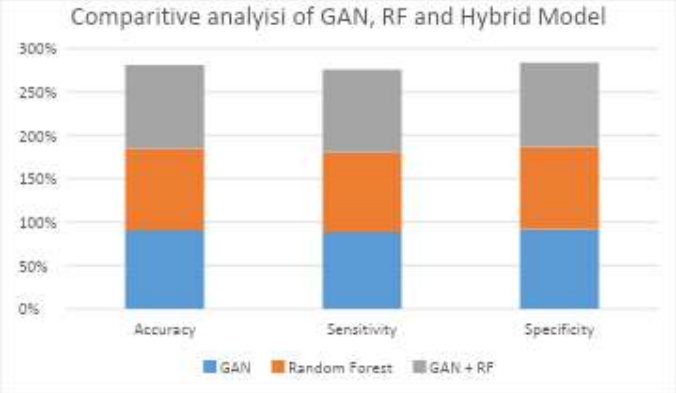
Figure 1 represents the working of hybrid model



Comparison Table: GAN vs. Random Forest in Crop Yield Analysis

Model	Accuracy	Sensitivity	Specificity
GAN	91%	89%	92%
Random Forest	94%	92%	95%
GAN + RF	96%	95%	97%

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)



Using fictitious values for accuracy, sensitivity, and specificity in c rop production prediction, the table you requested contrasts the performance of three methods: GAN alone, Random Forest (RF) alone, and a hybrid model combining GAN-based data augmentation with RF. The following explains the significance of these findings and the reasons for the observed differences:

Gan

The main application of GANs (Generative Adversarial Networks) is data augmentation, particularly when working with sparse or unbalanced datasets. When used alone for prediction, GANs typically do not achieve the highest accuracy because their main strength is in generating realistic synthetic data, not direct classification or regression. As a result, their sensitivity and specificity are generally lower compared to dedicated predictive models.

Random Forest

Random Forest is a robust ensemble learning algorithm well-suited for crop yield prediction. It handles non-linear relationships and high-dimensional data effectively, often achieving high accuracy and strong generalization16. Studies show that RF models can achieve accuracy rates above 94% in crop yield tasks, with good sensitivity and specificity, making them a standard in agricultural analytics16. However, RF performance may vary depending on the nature of crop.

GAN + RF (Hybrid Model)

The hybrid approach leverages the strengths of both methods: GANs are used to augment the dataset by generating additional synthetic samples, which helps address data scarcity and class imbalance2. The enriched dataset is then used to train the RF model. This combination typically results in improved model performance across all metrics—accuracy, sensitivity, and specificity—because the RF can learn from a more diverse and balanced dataset2. As a result, the hybrid model often outperforms either method used alone, particularly in challenging data scenarios.

Why the Hybrid Model Performs Best

- Data Augmentation: GANs generate samples that help the RF model generalize better, especially when real data is scarce or imbalanced.
- Enhanced Learning: RF models trained on augmented datasets are less prone to overfitting and can better capture the underlying patterns in the data2.
- Improved Metrics: This synergy leads to higher accuracy, sensitivity (ability to correctly identify high-yield cases), and specificity (ability to correctly identify low-yield cases).

Conclusion

The integration of advanced deep learning techniques such as Generative Adversarial Networks (GANs) with ensemble machine learning methods like Random Forest (RF) marks a significant advancement in crop yield prediction. While GANs excel at generating high-quality synthetic data to address challenges of data scarcity and imbalance, Random Forests provide robust and interpretable predictive capabilities. The hybrid approach—using GANs for data augmentation followed by RF for prediction—demonstrates superior performance across key metrics such as accuracy, sensitivity, and specificity compared to either method used alone. This synergy not only enhances the reliability and generalizability of crop yield models but also empowers stakeholders in agriculture with more precise and actionable insights. By leveraging the strengths of both deep learning and ensemble methods, this framework supports better decision-making,

Abstract

India's journey towards Viksit Bharat @2047 requires a transformation that combines technological advancement with inclusive and sustainable economic development. Artificial Intelligence (AI) and Digital Public Infrastructure (DPI) have emerged as two important pillars of this transformation. While DPI provides the digital foundations for identity, payments, data exchange, and access to public and private services, AI can add intelligence, automation, personalization, and predictive capabilities to these systems. Together, they can significantly improve governance, healthcare, education, agriculture, financial inclusion, digital commerce, and public service delivery. This paper examines the role of AI-enabled Digital Public Infrastructure in building a developed India by 2047. It explores opportunities, challenges, ethical considerations, and the need for responsible and inclusive AI adoption. The paper argues that India's competitive advantage will depend not merely on technological adoption but on developing trusted, accessible, secure, multilingual, and citizen-centric digital ecosystems. Strengthening digital skills, cybersecurity, data governance, research and innovation, and public-private partnerships will be essential for realizing this vision. AI combined with DPI can become a powerful foundation for inclusive prosperity, innovation, and sustainable development in Viksit Bharat.

Keywords: *Artificial Intelligence, Digital Public Infrastructure, Viksit Bharat @2047, Digital Economy, Inclusive Growth, Digital Governance, Sustainable Development*

Introduction

India is undergoing a profound digital transformation that is reshaping the way citizens, businesses, governments, and institutions interact with one another. Over the past decade, digital technologies have moved beyond being tools of convenience and have become an important part of India's economic and social infrastructure. Digital payments, online banking, e-commerce, telemedicine, digital education, electronic governance, digital identity, and online public-service delivery have significantly changed the way people access information, conduct transactions, and participate in economic activities. [1] This transformation has created a strong foundation for India's long-term development. As the country moves towards the vision of **Viksit Bharat @2047**, the objective is not simply to increase the use of technology but to leverage technology as an instrument for **inclusive economic growth, social empowerment, innovation, good governance, and sustainable development.** Viksit Bharat represents the aspiration of building a developed India that is economically strong, technologically advanced, socially inclusive, environmentally responsible, and capable of competing effectively in the global economy. In this context, **Digital Public Infrastructure (DPI)** and **Artificial Intelligence (AI)** have emerged as two important technological pillars for India's future development. Digital Public Infrastructure provides the foundational digital systems that enable citizens, businesses, governments, and innovators to participate in the digital economy. It creates interoperable and scalable platforms through which a wide range of services can be delivered efficiently and at population scale. [2], [3] India's experience with digital public infrastructure demonstrates how technology can transform access to services. Digital identity systems can facilitate secure identification and authentication, digital payment infrastructure can enable fast and convenient financial transactions, and digital platforms can simplify access to government and private-sector services.

Quick Response Code:

Website: https://bnir.us

These capabilities can reduce transaction costs, improve transparency, increase efficiency, and enable individuals and businesses including small enterprises and entrepreneurs to participate more effectively in the formal digital economy. [5-7] However, infrastructure alone is not sufficient to address the increasingly complex needs of a large and diverse population. This is where **Artificial Intelligence** becomes particularly important. AI enables computer systems to process large volumes of data, recognize patterns, generate predictions, automate routine activities, understand natural language, and provide intelligent recommendations. As a result, AI can transform conventional digital services into systems that are more adaptive, predictive, personalized, and responsive. The potential applications of AI extend across almost every major sector of the Indian economy. In **healthcare**, AI can assist with disease detection, medical analysis, patient monitoring, and healthcare planning. In **agriculture**, it can support farmers through crop monitoring, weather analysis, pest and disease identification, and market intelligence. In **education**, AI can facilitate personalized learning, intelligent tutoring, multilingual educational content, and improved assessment. In **banking and finance**, it can strengthen fraud detection, risk assessment, customer service, and financial inclusion. Similarly, in **commerce and industry**, AI can improve demand forecasting, supply-chain management, logistics, production efficiency, and customer engagement. [8-11] The convergence of DPI and AI creates an even greater opportunity. **DPI can provide the digital foundation, connectivity, interoperability, and access, while AI can provide intelligence and decision-support capabilities on top of that foundation.** Together, they can create a new generation of citizen-centric digital services.

For example, a farmer could potentially access an integrated digital ecosystem that combines identity, financial services, agricultural information, weather data, market information, and AI-based recommendations. Similarly, a small business could use digital payments, digital commerce platforms, financial services, and AI-powered business tools to reach customers, manage inventory, forecast demand, and improve productivity. Such integration can reduce barriers to participation and create opportunities for people and enterprises that may previously have had limited access to sophisticated technologies [12] The combination of AI and DPI can also play an important role in **inclusive development.** India's social, economic, geographic, and linguistic diversity requires digital solutions that can reach people across different regions and socioeconomic groups. AI-powered multilingual interfaces, voice-based services, accessibility technologies, and localized digital applications can help overcome linguistic and technological barriers. This can make digital services more accessible to rural communities, senior citizens, persons with disabilities, small entrepreneurs, and individuals with limited digital literacy. [13] At the same time, India's digital transformation must remain **responsible and human-centric.** The widespread adoption of AI and digital infrastructure creates important concerns relating to data privacy, cybersecurity, algorithmic bias, misinformation, digital exclusion, and employment disruption. Therefore, technological progress must be accompanied by appropriate safeguards, transparent systems, responsible data governance, digital literacy, and continuous reskilling of the workforce. [14], [15] Another important dimension is **sustainable development**. AI-enabled digital systems can help optimize energy consumption, improve transportation and logistics, support precision agriculture, monitor environmental conditions, manage resources efficiently, and strengthen climate-risk assessment. Thus, the digital transformation associated with Viksit Bharat should not be viewed only as an economic or technological agenda; it should also contribute to India's environmental and sustainability objectives. [12], [17-18] Ultimately, the success of India's digital future will depend on how effectively technology is connected with **human capital, innovation, entrepreneurship, institutional capacity, and inclusive governance.** AI and DPI should not operate as isolated technological initiatives. They should form part of a broader development strategy in which digital innovation improves productivity, expands economic opportunity, strengthens public services, and enhances the quality of life of citizens [19-22]. Therefore, the integration of **Artificial Intelligence and Digital Public Infrastructure** represents a significant opportunity for India to accelerate its journey towards Viksit Bharat @2047. DPI can establish the foundational architecture of a digitally empowered society, while AI can provide the intelligence required to make this architecture more efficient, predictive, personalized, and innovative. If developed responsibly and inclusively, their convergence can become a powerful catalyst for **economic growth, social empowerment, digital inclusion, innovation, and sustainable development**, helping India build a resilient and globally competitive economy by 2047 [23-25].

Understanding Digital Public Infrastructure

Digital Public Infrastructure (DPI) refers to shared and foundational digital systems that enable

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

citizens, businesses, governments, and organizations to participate effectively in the digital economy and society. Similar to physical infrastructure such as roads, electricity, and transportation networks, DPI provides the basic digital foundation upon which a wide range of services can be developed and delivered at scale. Key components include **digital identity, digital payments, data exchange and consent mechanisms, digital document systems, public digital platforms, digital health and education infrastructure, and open and interoperable technology standards.** These systems help make digital services more accessible, efficient, secure, and convenient. For a country as large and diverse as India, DPI is particularly important because it can connect people across different geographical, economic, and social backgrounds with essential services and opportunities. [2], [4] India's experience with digital transformation demonstrates the potential of DPI to create population-scale digital ecosystems. Digital identity and payment systems, online government services, digital documentation, and other platforms have enabled citizens to access services more conveniently while creating opportunities for businesses and innovators to develop new solutions. The importance of DPI extends beyond government administration because it provides a common foundation on which **banks, fintech companies, start-ups, MSMEs, e-commerce businesses, healthcare providers, educational institutions, and other organizations** can build innovative products and services. By enabling interoperability and reducing the need to create separate digital infrastructure for every service, DPI can lower transaction costs, improve efficiency, encourage competition, and accelerate innovation. It can also support rural communities and underserved populations by improving access to financial services, education, healthcare, markets, and government schemes. [5-7] DPI is therefore an important foundation for achieving the vision of **Viksit Bharat @2047**. It can promote financial inclusion by enabling people and small businesses to participate in the formal digital economy, while digital commerce can help entrepreneurs and MSMEs reach wider markets. When DPI is combined with **Artificial Intelligence**, its potential becomes even greater. AI can use digital systems and data to provide intelligent recommendations, automate processes, detect fraud, improve service delivery, support decision-making, and create personalized services in areas such as agriculture, healthcare, education, finance, and governance. At the same time, DPI must be developed with strong attention to **data privacy, cybersecurity, digital literacy, accessibility, and inclusion** so that technological progress does not create new inequalities. In this way, DPI can serve as the digital foundation, while AI provides the intelligence and innovation needed to build a **connected, inclusive, productive, sustainable, and globally competitive India by 2047.**

The Role of Artificial Intelligence

Artificial Intelligence (AI) is emerging as a transformative technology that can significantly strengthen Digital Public Infrastructure (DPI) and accelerate India's journey towards **Viksit Bharat @2047**. While DPI provides the basic digital foundation for identity, payments, data exchange, and service delivery, AI adds an **intelligence layer** that enables systems to analyze large amounts of information, recognize patterns, make predictions, automate routine processes, and provide personalized recommendations. In this way, AI can transform digital infrastructure from systems that primarily facilitate transactions into **intelligent, responsive, and citizen-centric systems**. The integration of AI with DPI can improve efficiency, reduce costs, support better decision-making, and make digital services more accessible to citizens and businesses. AI has significant applications across key sectors of the Indian economy. In **healthcare**, AI can assist healthcare professionals by analyzing medical information, supporting early disease detection, predicting health risks, and improving the delivery of healthcare services, particularly in areas where access to specialists may be limited. In **agriculture**, AI can analyze weather conditions, soil information, crop data, and market trends to provide farmers with timely recommendations. AI-based systems can also help identify crop diseases, optimize the use of water and fertilizers, and improve productivity. In **education**, AI can support personalized learning by adapting educational content according to individual students' needs and learning abilities. Intelligent tutoring systems, automated assessment, translation tools, and multilingual educational resources can make quality education more accessible to students across different regions and languages. [8-10] AI can also play an important role in **governance, commerce, and financial inclusion**. In governance, AI can process large datasets, identify patterns, forecast requirements, and support evidence-based policymaking, thereby helping governments improve the efficiency and responsiveness of public services. In **digital commerce**, AI can assist businesses with demand forecasting, inventory management, customer service, fraud detection, logistics, and market analysis. This can be particularly valuable for MSMEs by helping them

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

make better business decisions and compete in increasingly digital markets. In the area of **financial inclusion**, AI can strengthen fraud detection, support responsible credit assessment, provide financial literacy tools, and help deliver appropriate financial products to underserved communities. Thus, AI can become a powerful tool for improving productivity, expanding access, and creating new opportunities. However, its adoption must be accompanied by **data privacy, cybersecurity, transparency, ethical standards, human oversight, and digital skills** to ensure that AI-driven development remains responsible and inclusive. When combined with India's Digital Public Infrastructure, AI can become a major catalyst for innovation, inclusive growth, and sustainable development on the path towards Viksit Bharat @2047. [16], [17]

AI + DPI as a Foundation for Viksit Bharat

The real transformative potential of India's digital future lies in the **integration of Artificial Intelligence (AI) with Digital Public Infrastructure (DPI)**. While DPI provides the foundational layer of digital connectivity, identity, payments, data exchange, and access to services, AI adds an intelligence layer that can analyze information, identify patterns, make predictions, automate processes, and provide personalized solutions. This combination can create a powerful digital ecosystem in which technology is not limited to enabling transactions but actively contributes to better decision-making, productivity, innovation, and service delivery. A useful way of understanding this transformation is: **Digital Infrastructure → Data and Connectivity → AI Intelligence → Better Services → Higher Productivity → Inclusive Growth → Viksit Bharat**. In this model, DPI provides the essential foundation, while AI converts digital capabilities and information into intelligent and actionable solutions. The integration of AI and DPI can have a significant impact on **agriculture, healthcare, education, finance, governance, and commerce**. For instance, a small farmer connected to digital infrastructure could potentially access AI-powered agricultural advisory services, weather forecasts, crop-health information, market prices, digital financial services, and wider markets through interconnected platforms. AI could analyze local conditions and provide timely recommendations regarding crops, irrigation, fertilizers, or potential risks. Similarly, in healthcare, the combination of digital health infrastructure and AI could support remote consultations, early identification of health risks, and more efficient allocation of healthcare resources. In education, AI-enabled digital platforms could provide personalized learning materials and multilingual educational support, allowing students from different regions to access learning opportunities according to their individual needs.

The benefits of AI and DPI also extend to **entrepreneurs, MSMEs, and the broader digital economy**. A small business can use digital identity, digital payments, online commerce, financial services, and AI-powered business tools to reach customers, manage inventory, understand consumer demand, detect fraudulent transactions, and make better business decisions. This can reduce operational costs and enable smaller enterprises to compete more effectively with larger organizations. At the national level, AI-enabled DPI can improve public-service delivery, strengthen evidence-based policymaking, increase economic productivity, and encourage innovation. However, achieving these benefits requires attention to **digital inclusion, data privacy, cybersecurity, responsible AI, digital literacy, and human oversight**. If developed in an inclusive and responsible manner, the convergence of AI and DPI can become a powerful foundation for building an India that is **technologically advanced, economically productive, socially inclusive, and sustainable by 2047**.

AI and Inclusive Digital Growth

One of the most important objectives of **Viksit Bharat @2047** is to ensure that the benefits of technological progress reach every section of society. Economic development cannot be considered truly successful if advanced technologies remain accessible only to urban populations, large businesses, or highly skilled individuals. **Artificial Intelligence (AI), when integrated with Digital Public Infrastructure (DPI), can help make digital transformation more inclusive** by reducing barriers related to language, geography, disability, income, and digital literacy. The objective should be to create a digital ecosystem in which technology becomes an enabler of opportunity for citizens across both urban and rural India. AI-enabled DPI can support inclusion in several important ways. **Multilingual digital services** can allow citizens to access information and public services in their preferred Indian languages, while **voice-based interfaces** can help people who have limited literacy or difficulty using conventional text-based applications. AI-powered accessibility technologies can assist persons with disabilities through speech recognition, text-to-speech, image interpretation, and other assistive solutions. In rural areas, AI can strengthen access to digital healthcare, agricultural information, education, financial services, and government

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

schemes. Similarly, AI-enabled financial technologies can support affordable and convenient financial services, while personalized digital education can provide learners with content and guidance suited to their individual needs. Small businesses and entrepreneurs can also benefit from AI-based tools for marketing, accounting, customer support, demand forecasting, and business decision-making. [13] India's **linguistic, cultural, geographical, and socioeconomic diversity** makes inclusive digital design particularly important. AI systems capable of understanding Indian languages, local contexts, and different patterns of user interaction can help reduce barriers to digital participation. For example, a citizen who is more comfortable communicating through voice or a regional language should not be excluded from a digital service simply because the platform is designed primarily for English-speaking or highly digitally literate users. At the same time, inclusive AI must be developed with attention to **privacy, cybersecurity, affordability, accessibility, algorithmic fairness, and human oversight**. By combining the reach of DPI with the intelligence of AI, India can create a digital ecosystem that empowers citizens rather than excludes them. Such inclusive digital growth can strengthen **financial inclusion, entrepreneurship, employment, education, healthcare, and social mobility**, making technology a powerful instrument for achieving the broader vision of an equitable, prosperous, and developed **Viksit Bharat @2047**.

AI and Digital Commerce

Artificial Intelligence (AI), when combined with Digital Public Infrastructure (DPI), has the potential to significantly transform India's **digital commerce ecosystem**. The rapid expansion of digital payments, online marketplaces, e-commerce platforms, logistics networks, and digital financial services has created new opportunities for businesses to connect with customers beyond their traditional geographical boundaries. AI can further strengthen this ecosystem by enabling businesses to analyze large amounts of customer and market data, understand consumer preferences, predict demand, automate routine activities, and make faster and more informed business decisions. The integration of AI with interoperable digital infrastructure can therefore improve productivity, efficiency, competitiveness, and market access across India's digital economy. [9] The benefits can be particularly significant for **Micro, Small and Medium Enterprises (MSMEs)** and small entrepreneurs. Traditionally, larger companies have had greater access to sophisticated technologies, market research, data analytics, and specialized business resources. AI can help reduce this gap by making advanced business capabilities available through affordable digital tools. Small businesses can use AI for **customer analysis, inventory management, demand forecasting, digital marketing, fraud prevention, supply-chain optimization, customer support, and financial planning**. For example, an AI-based system can analyze previous sales and market trends to help a small retailer estimate future demand and maintain appropriate inventory. Similarly, AI-powered customer-service tools can help entrepreneurs respond to customer enquiries quickly, while digital marketing systems can identify potential customers and recommend appropriate promotional strategies. [9], [10]

The combination of AI and DPI can also help **democratize access to digital commerce.** Interoperable digital infrastructure can enable small businesses to participate in digital payments, online marketplaces, logistics services, and financial ecosystems without having to build expensive technological systems independently. A local artisan, farmer-producer, retailer, or service provider can potentially use digital platforms to reach customers across India and, in suitable cases, international markets. This can reduce geographical barriers and create opportunities for rural and semi-urban entrepreneurs. At the same time, digital commerce must be supported by strong consumer protection, cybersecurity, data privacy, and fair competition mechanisms to ensure trust in online transactions. AI-driven digital commerce can therefore contribute to **employment generation, entrepreneurship, productivity improvement, and inclusive economic growth**. By giving smaller enterprises access to tools that were previously available mainly to large organizations, technology can help create a more level competitive environment. This is particularly relevant to the vision of **Viksit Bharat @2047**, where economic development must be broad-based and should provide opportunities for businesses of different sizes and from different regions. The integration of AI, DPI, and digital commerce can create an ecosystem in which **technology enables businesses to innovate, markets become more accessible, consumers receive better services, and MSMEs become stronger contributors to India's digital economy.**

AI for Sustainable Development

The vision of **Viksit Bharat @2047** must go beyond economic growth and technological advancement to include **environmental sustainability, climate resilience, and responsible use of natural resources**. As India's population, industries, cities,

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

and digital economy continue to expand, the demand for energy, water, transportation, food, and other resources will also increase. Artificial Intelligence (AI), supported by Digital Public Infrastructure (DPI), can play an important role in addressing these challenges by enabling governments, businesses, farmers, and communities to make better decisions based on real-time data and intelligent analysis. In this context, AI can become an important tool for balancing economic development with environmental responsibility. [18] AI has applications across several areas of sustainable development. In the **energy sector**, AI can analyze patterns of energy consumption, forecast electricity demand, improve grid management, and support the integration of renewable energy sources. In **transportation**, AI can optimize traffic flows, improve logistics and route planning, reduce fuel consumption, and support the development of intelligent mobility systems. In **agriculture**, AI-powered precision farming can analyze soil conditions, weather patterns, crop health, and water requirements to help farmers use resources more efficiently. This can reduce unnecessary consumption of water, fertilizers, and pesticides while potentially improving agricultural productivity. AI can also support **environmental monitoring** by analyzing data related to air quality, water resources, forests, biodiversity, and pollution, allowing authorities to identify emerging environmental problems and take timely action. AI can also contribute to **waste management and climate-risk reduction**. Intelligent systems can help identify waste-generation patterns, optimize collection routes, improve waste segregation, and support recycling and circular-economy initiatives. Similarly, AI can process large volumes of climate and environmental data to identify patterns and improve predictions related to extreme weather events, droughts, floods, heatwaves, and other climate-related risks. Such information can support disaster preparedness and improve the resilience of communities and infrastructure. When AI is integrated with digital public systems, information can be shared more efficiently among government agencies, businesses, researchers, and citizens, enabling coordinated responses to environmental challenges. The integration of AI and DPI can therefore support India's transition towards a **resource-efficient, low-carbon, and resilient economy**. Digital infrastructure can provide the connectivity and data systems required to collect and exchange information, while AI can transform that information into useful insights for decision-making. However, the environmental impact of AI itself must also be considered, particularly the energy and computing resources required to operate large-scale AI systems. Therefore, India should encourage **energy-efficient computing, green data centres, renewable-energy adoption, sustainable digital infrastructure, and responsible technology design**. By ensuring that digital transformation and environmental sustainability progress together, AI-enabled DPI can contribute not only to higher economic productivity but also to **climate resilience, efficient resource management, sustainable innovation, and a greener Viksit Bharat by 2047**.

Challenges and Risks

Although the integration of **Artificial Intelligence (AI) with Digital Public Infrastructure (DPI)** offers significant opportunities for India's development, it also creates a range of technological, social, economic, and ethical challenges. The success of AI-enabled DPI cannot be measured only by the number of digital services introduced; it must also be evaluated in terms of **security, fairness, accessibility, transparency, privacy, and public trust**. If these risks are not addressed effectively, technological development could create new forms of inequality or vulnerability. Therefore, India needs a balanced approach that encourages innovation while establishing appropriate safeguards.

1. Data Privacy

The increasing use of digital platforms and AI systems involves the collection, processing, and exchange of large amounts of personal and sensitive information. This may include financial information, health records, identity-related information, location data, and other personal details. Unauthorized access, misuse, or inappropriate sharing of such information can threaten individual privacy and public trust. Strong data governance, secure data-handling practices, informed consent, access controls, and effective privacy protections are therefore essential for responsible AI-enabled DPI. [14]

2. Cybersecurity

As more essential services become digitally connected, the potential impact of cyberattacks also increases. Large-scale digital infrastructure may become a target for **hacking, identity theft, ransomware, financial fraud, phishing, and other forms of cybercrime**. A successful attack on critical digital systems could affect individuals, businesses, and public services on a large scale. India therefore needs continuous investment in cybersecurity infrastructure, threat detection, encryption, security standards, incident-response mechanisms, and cybersecurity awareness. [14]

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

3. Algorithmic Bias

AI systems learn from data, and biased or incomplete data can result in biased outcomes. An AI system may unintentionally disadvantage particular groups if the data used to develop it does not adequately represent India's diverse population. This is particularly important when AI is used in areas such as employment, finance, healthcare, education, or access to public services. **Fairness, transparency, representative datasets, regular testing, and human oversight** are necessary to minimize algorithmic bias and ensure that AI systems operate equitably. [14]

4. Digital Divide

Technological progress does not automatically benefit everyone equally. People living in areas with poor connectivity or limited access to digital devices may be unable to fully participate in the digital economy. Similarly, differences in income, education, age, disability, language, and digital literacy can affect people's ability to use digital services. The digital divide is therefore a major challenge for inclusive development. India must continue to expand affordable connectivity, improve digital literacy, provide accessible digital interfaces, and maintain assisted or alternative service channels for citizens who cannot independently access digital platforms. [4]

5. Employment Disruption

AI, automation, and intelligent systems can increase productivity but may also change the nature of existing occupations. Certain repetitive and routine tasks may increasingly be automated, potentially affecting some categories of employment. At the same time, AI is likely to create new occupations and increase demand for skills in areas such as data science, AI development, cybersecurity, digital management, and technology-enabled services. The challenge is therefore to ensure a smooth transition through **reskilling, upskilling, vocational education, lifelong learning, and industry-oriented training** so that workers can adapt to changing employment requirements. [11], [12]

6. Lack of AI Literacy

The effective and responsible use of AI requires more than access to technology. Citizens need to understand the basic capabilities and limitations of AI, while employees, entrepreneurs, educators, and government officials need appropriate skills to use AI tools effectively. Lack of AI literacy can lead to overdependence on automated systems, misunderstanding of AI-generated information, misuse of technology, and vulnerability to misinformation or fraud. Developing **AI literacy and digital awareness** should therefore become an important part of India's education and workforce-development strategies.

7. Trust and Accountability

Public trust is fundamental to the successful adoption of AI-enabled digital services. Citizens need assurance that digital systems are **secure, transparent, reliable, fair, and accountable**. When an AI system makes an important recommendation or decision, users should have appropriate information about how the system is being used and, where necessary, access to human review or corrective mechanisms. Clear responsibilities must also exist when an AI-enabled system produces an error or causes harm. Establishing accountability frameworks, transparency mechanisms, ethical standards, and human oversight can strengthen confidence in AI and DPI. [14], [15]

Addressing the Challenges

These challenges demonstrate that India's AI and DPI strategy must focus not only on **technological innovation but also on responsible governance**. Strong data protection, cybersecurity, ethical AI standards, inclusive infrastructure, workforce development, and public awareness should develop alongside technological capabilities. Government, industry, academia, start-ups, and civil society all have important roles to play in creating a trustworthy digital ecosystem. Ultimately, the objective should be to ensure that AI-enabled DPI **enhances human capabilities rather than creating new barriers or inequalities**. By addressing these challenges proactively, India can build a digital ecosystem that is innovative while remaining secure, inclusive, transparent, and citizen-centric. This balance between innovation and responsibility will be essential for ensuring that AI and digital infrastructure genuinely contribute to the long-term vision of **Viksit Bharat @2047**.

Building Responsible AI Infrastructure

India's AI future should be built on the principle of **responsible, inclusive, secure, and human-centric innovation**. As Artificial Intelligence becomes increasingly integrated with Digital Public Infrastructure, it is essential to ensure that technological progress is accompanied by appropriate safeguards and accountability. Responsible AI infrastructure should not focus only on developing powerful technologies; it should also ensure that these technologies are trustworthy, accessible, fair, transparent, and beneficial to society. This is particularly important for India because AI-enabled systems may increasingly influence areas such as healthcare, education, finance, employment, agriculture, and public-service delivery. The objective should therefore be to develop AI systems that **support human decision-making, protect individual rights, and promote inclusive economic and social**

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

development. [14], [15] A major priority should be **strong data governance, privacy, and cybersecurity**. AI systems depend heavily on data, making it essential to ensure that data is collected, stored, processed, and shared responsibly. Effective privacy safeguards, secure digital infrastructure, access controls, and cybersecurity mechanisms are necessary to protect citizens and organizations from misuse and cyber threats. AI systems should also be **transparent and accountable**, particularly when they are used for high-impact decisions. Human oversight should be maintained where automated decisions can significantly affect an individual's rights, opportunities, financial position, healthcare, or access to public services. In addition, India should encourage the development of **Indian-language AI systems** that can understand the country's diverse linguistic and cultural contexts. Multilingual AI can make digital services more accessible to citizens who may not be comfortable using English-based technologies. [14] Another important priority is the development of **open, interoperable, and scalable digital standards** that allow different AI and digital systems to work together effectively. Investment in AI research and development should be strengthened through collaboration among **government institutions, universities, research organizations, technology companies, start-ups, and industry**. Such partnerships can accelerate innovation and help develop AI solutions specifically suited to India's social and economic needs. At the same time, AI education, digital literacy, and workforce training must be expanded so that students, employees, entrepreneurs, and public officials can understand and use AI effectively. Finally, **inclusive access to digital infrastructure** must remain central to India's AI strategy. Affordable internet connectivity, access to digital devices, accessible platforms, rural connectivity, and digital skills are essential to ensure that AI does not become a technology available only to privileged sections of society. [16], [17] Building responsible AI infrastructure therefore requires a comprehensive approach that combines **innovation with ethics, security with accessibility, and technological advancement with social responsibility**. India must create an environment in which AI can grow while maintaining public trust and protecting citizens' interests. By investing in responsible AI, human capital, digital infrastructure, research, and inclusive access, India can develop a digital ecosystem that supports entrepreneurship, improves public services, strengthens economic productivity, and contributes to sustainable development. Such an approach will ensure that AI becomes not merely a technological achievement but a **powerful instrument for inclusive and responsible development under the vision of Viksit Bharat @2047.**

Roadmap to 2047

Achieving the vision of **Viksit Bharat @2047** through Artificial Intelligence (AI) and Digital Public Infrastructure (DPI) requires a long-term, coordinated, and inclusive strategy. India needs to move beyond the adoption of individual technologies and develop an integrated digital ecosystem that connects infrastructure, innovation, human capabilities, responsible governance, and sustainability. The roadmap to 2047 should focus on creating an environment in which digital technologies are accessible to all citizens, businesses can innovate and compete globally, and AI contributes to economic and social development. Five major pillars can provide a strategic framework for this transformation.

Pillar 1: Universal Digital Access

The first priority should be to ensure **universal and affordable access to digital infrastructure**. Every citizen should have the opportunity to participate in India's digital economy irrespective of geographical location, income, language, gender, age, or social background. This requires continued expansion of reliable internet connectivity, access to affordable digital devices, digital identity, secure digital payments, and essential online services. Digital literacy should also be strengthened so that citizens can confidently use digital platforms and protect themselves from online fraud and misinformation. Special attention should be given to rural and remote areas, persons with disabilities, senior citizens, and communities that face barriers to digital participation. Universal access will provide the foundation upon which an inclusive AI-enabled economy can develop. [4]

Pillar 2: AI Innovation

The second pillar should focus on making India a **global centre for AI research, innovation, and entrepreneurship**. This requires increased investment in research and development, advanced computing infrastructure, data ecosystems, AI start-ups, universities, and industry-led innovation. Collaboration between research institutions and businesses should be encouraged to convert scientific discoveries into practical solutions. India should also promote AI applications designed for its own economic and social requirements, including agriculture, healthcare, education, manufacturing, governance, financial services, and climate management. Developing AI capabilities in Indian languages and creating solutions that can operate effectively in diverse environments will

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

further strengthen India's position as a global AI innovator. [16], [17]

Pillar 3: Human Capital

Technology can transform the economy only when supported by a **skilled and adaptable workforce**. India must therefore invest significantly in AI education, digital skills, data literacy, cybersecurity, entrepreneurship, and interdisciplinary learning. Educational institutions should provide students with opportunities to understand both the technical and social dimensions of emerging technologies. At the same time, existing employees should have access to continuous upskilling and reskilling programs so they can adapt to changing workplace requirements. Vocational education and industry-oriented training should also be strengthened. Developing human capital will ensure that India's demographic strength becomes a long-term advantage and that citizens can participate meaningfully in the AI-driven economy. [11], [12]

Pillar 4: Responsible Technology

The fourth pillar should focus on building **trustworthy, ethical, secure, and accountable AI systems**. As AI becomes increasingly integrated into public and private services, strong mechanisms are required to protect privacy, prevent cyber threats, reduce algorithmic bias, and ensure transparency. High-impact AI applications should have appropriate human oversight and accountability mechanisms. Citizens should have confidence that their personal information is protected and that automated systems are used fairly and responsibly. Strong cybersecurity capabilities, responsible data governance, transparent AI practices, and appropriate regulatory frameworks will be essential for maintaining public trust. India's technological progress should therefore be guided by the principle that innovation and responsibility must develop together. [14], [15]

Pillar 5: Sustainable Digital Growth

The fifth pillar should ensure that India's digital transformation contributes to **environmental sustainability and climate resilience**. AI and DPI can support energy efficiency, smart transportation, precision agriculture, water management, waste reduction, renewable-energy integration, and sustainable urban development. AI-based systems can analyze environmental and operational data to identify inefficiencies and improve resource allocation. At the same time, the environmental footprint of digital technologies—including energy consumption by data centres and computing infrastructure—must also be addressed. India should promote energy-efficient computing, renewable energy for digital infrastructure, green data centres, and sustainable technology practices. [18], [19]

An Integrated Vision for 2047

These five pillars should not operate independently. They must function as an interconnected development strategy:

Universal Digital Access → AI Innovation → Skilled Human Capital → Responsible Technology → Sustainable Growth → Viksit Bharat @2047

Universal access provides the foundation for participation; innovation creates new technologies and opportunities; human capital provides the skills required using and developing these technologies; responsible governance ensures trust and security; and sustainable growth ensures that development benefits both present and future generations.

By 2047, India can aspire to establish a **globally competitive, inclusive, intelligent, secure, and sustainable digital economy**. The success of this roadmap will depend on sustained investment, effective policy implementation, collaboration between stakeholders, and continuous adaptation to technological change. Most importantly, the development of AI and DPI should remain focused on improving people's lives and expanding opportunities across society. Through this integrated approach, technology can become a powerful instrument for achieving the broader national vision of **Viksit Bharat @2047**.

Expected Impact on Viksit Bharat

AI-enabled Digital Public Infrastructure can contribute to Viksit Bharat through multiple channels:

Table. I: Potential Contributions of Digital Transformation Across Key Sectors

Area	Potential Contribution
Governance	Faster and more responsive public services [4], [16]
Healthcare	Improved access, diagnosis and service delivery [8]
Education	Personalized and accessible learning [1]
Agriculture	Better productivity and resource management [1]
Commerce	Greater market access for businesses [9]
Finance	Expanded financial inclusion [10]

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

MSMEs	Higher productivity and digital participation [9], [10]
Employment	New technology-driven opportunities [11], [12]
Sustainability	Better resource and energy management [18], [19]
Innovation	New products, services and business models [16], [17]

The table highlights the potential contribution of digital transformation and emerging technologies across key sectors. It shows how technology can improve public services, healthcare, education, agriculture, finance, commerce, employment, sustainability, and innovation by increasing efficiency, accessibility, productivity, and inclusion. [4], [5], [8], [9], [10], [11], [12], [18]

Conclusion

The journey towards **Viksit Bharat @2047** will depend significantly on India's ability to harness technology as a powerful instrument of **inclusive, sustainable, and people-centred development**. Digital transformation is no longer limited to improving convenience or automating existing processes; it has become an important foundation for economic growth, social empowerment, innovation, and effective governance. In this transformation, **Digital Public Infrastructure (DPI)** and **Artificial Intelligence (AI)** can play complementary and mutually reinforcing roles. DPI provides the foundational digital ecosystem through which citizens, businesses, governments, and institutions can connect and access services, while AI adds intelligence that can make these systems more adaptive, predictive, efficient, personalized, and responsive to changing needs. The integration of **AI + DPI** can transform multiple dimensions of Indian society and the economy. It can improve public-service delivery, strengthen healthcare and education, empower farmers, support MSMEs and entrepreneurs, expand financial inclusion, improve digital commerce, and create new employment and innovation opportunities. Importantly, these benefits can extend beyond major cities to rural and underserved communities, helping reduce geographical and socioeconomic inequalities. AI-enabled digital systems can also support sustainable development by improving energy efficiency, optimizing resource utilization, strengthening climate resilience, and promoting environmentally responsible economic activities. [5], [8-12] However, **technology alone cannot guarantee development**. The successful realization of Viksit Bharat requires simultaneous investment in human capital, digital literacy, research and development, cybersecurity, data governance, responsible AI, and inclusive digital infrastructure. India must ensure that citizens have the skills and opportunities necessary to participate in the digital economy and that AI systems operate with appropriate standards of privacy, transparency, fairness, accountability, and human oversight. Building public trust will be essential because the long-term success of AI and DPI will depend not only on technological capability but also on citizens' confidence in the systems they use. [14, 15] Ultimately, the vision should be to create a digital ecosystem in which **innovation serves society, technology expands opportunity, and economic growth remains inclusive, secure, and sustainable**. India's existing digital capabilities provide a strong foundation, while the responsible adoption of AI can create new possibilities for productivity, innovation, governance, and social development. By bringing together **technology, human capital, entrepreneurship, responsible governance, and sustainability**, India can build a resilient and globally competitive digital economy. The effective convergence of AI and DPI can therefore become one of the important foundations for India's transformation into a **developed, inclusive, innovative, and sustainable nation by 2047**.

Acknowledgement

I express my sincere gratitude to all those who have supported and contributed to the successful completion of this research paper entitled "AI and Digital Public Infrastructure: Building the Foundations of Viksit Bharat @2047." I am deeply thankful to my institution, SGA Government Degree College, Yellamanchili, for providing the academic environment and encouragement necessary for carrying out this work. I also extend my sincere appreciation to my colleagues, mentors, and well-wishers for their valuable guidance, constructive suggestions, and continuous support throughout the preparation of this research paper.

Abstract

The rapid evolution of information technology and the global transition toward low-carbon energy systems are exposing important limitations in relying exclusively on conventional silicon-based platforms. Nanomaterials provide a complementary route because their electronic, optical, mechanical and interfacial properties can be engineered at dimensions where quantum confinement, two-dimensional transport and defect/interface effects become technologically useful. This review critically examines three material families—graphene, semiconductor quantum dots and metal-halide perovskite thin films—as representative pillars of a post-silicon and low-carbon technology landscape. Graphene is considered for high-mobility sensing, transparent and flexible electronics, photodetection and energy storage; quantum dots for spectrally tunable optoelectronics, displays, photodetectors and photovoltaic light harvesting; and perovskite thin films for lightweight photovoltaics, tandem solar cells and multifunctional optoelectronic devices. Recent literature indicates rapid gains in perovskite photovoltaic efficiency and stability engineering, while commercialization of graphene and quantum-dot technologies is progressing more selectively and remains constrained by integration, lifetime, materials and manufacturing issues. The review uses a literature-based comparative framework rather than claiming new experimental measurements. The analysis identifies scalability, long-term stability, environmental safety, lifecycle management and integration with existing manufacturing infrastructure as common barriers. For India, the strategic opportunity lies not simply in replacing silicon, but in combining silicon with emerging nanomaterials to create advanced sensors, displays, energy harvesters and tandem photovoltaic systems. Such a materials ecosystem can support digital infrastructure, renewable-energy deployment, domestic advanced manufacturing and the longer-term technological objectives associated with Viksit Bharat 2047. Future progress will depend on reproducible synthesis, sustainable processing, device-level reliability, responsible materials management and stronger links between laboratory research and scalable manufacturing.

Graphical Abstract

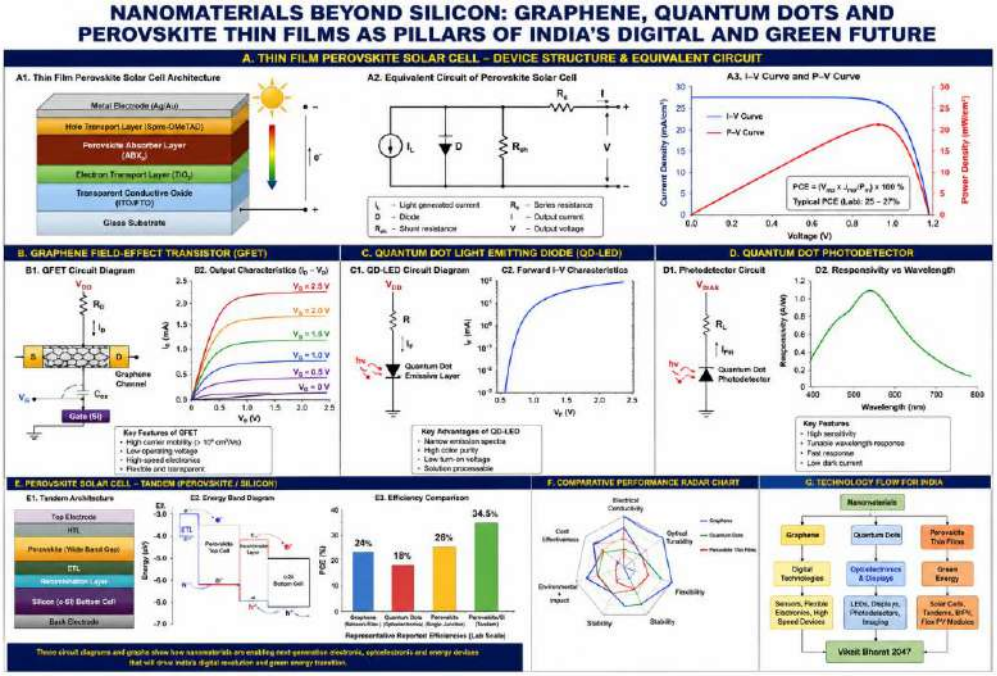

Figure 1. Graphical Abstract: Nanomaterials beyond silicon and their complementary roles in digital and green technologies. Schematics are illustrative and intended to explain operating principles. Graphical Abstract. Nanomaterials beyond silicon: complementary roles of graphene, quantum dots and perovskite thin films in digital and green technologies.

Introduction

Silicon has been the dominant platform of modern electronics and remains indispensable for processors, memories, sensors and photovoltaic devices. Its mature manufacturing ecosystem, controllable doping, established reliability and large industrial base make silicon difficult to displace. Nevertheless, continued miniaturization, rising energy demand, new requirements for flexible and multifunctional devices, and the need for higher-efficiency solar conversion have encouraged researchers to explore materials whose properties differ fundamentally from those of bulk silicon. The objective is therefore better described as moving beyond silicon in selected functions rather than abandoning silicon altogether. Nanomaterials are especially attractive because their properties can be engineered through dimensionality, size, composition, interfaces and surface chemistry. Graphene provides an atomically thin carbon platform with high electrical and thermal conductivity, mechanical robustness and optical transparency. Quantum dots exhibit size-dependent electronic structure arising from quantum confinement, enabling tunable absorption and emission. Metal-halide perovskites combine strong light absorption, tunable bandgaps and solution-compatible thin-film processing, making them prominent candidates for next-generation photovoltaics. This review evaluates these three material classes from a physics and technology perspective. It focuses on the relationship between fundamental properties and practical applications, compares their technological strengths and limitations, and discusses how their complementary roles could contribute to India's digital and green transition. The discussion deliberately avoids treating laboratory records as guaranteed commercial performance. Instead, reported achievements are interpreted alongside stability, scalability, environmental and manufacturing constraints.

Silicon and the Need for Advanced Nanomaterials

Silicon technology benefits from decades of process optimization, high-purity feedstock production, mature lithography and established packaging. These advantages create a very high barrier to substitution. At the same time, emerging applications require properties that silicon alone does not readily provide. Examples include atomically thin and mechanically flexible conductors, spectrally selective light emitters, solution-processable photodetectors, lightweight solar modules and multifunctional sensing surfaces. A useful strategy is therefore heterogeneous integration. Graphene can function as a conductive, sensing or optoelectronic layer; quantum dots can supply wavelength-selective optical functions; and perovskites can act as strong absorbers or emitters.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Such components can be integrated with silicon rather than competing with it. Recent work on graphene electronics emphasizes both the promise of two-dimensional materials and the difficulty of introducing new materials into established semiconductor foundries [1,2]. Similarly, perovskite–silicon tandem photovoltaics illustrate a practical beyond-silicon model in which an emerging absorber is placed on a mature silicon platform [9,10].

Graphene: A Two-Dimensional Platform for Digital Technologies

Graphene consists of a single layer of carbon atoms arranged in a honeycomb lattice. Its unusual band structure, high carrier mobility, mechanical strength, thermal transport and optical properties have made it a foundational two-dimensional material. The most important technological point is not that graphene is universally superior to silicon, but that it provides combinations of properties that are valuable in applications where silicon is less suitable. For electronics, graphene can serve as a transparent electrode, interconnect, sensing layer or component in hybrid devices. Its high conductivity and atomic thickness are useful for flexible and transparent platforms. Graphene has also been investigated in photodetectors and high-frequency components. Recent reviews of graphene MEMS/NEMS emphasize its utility as an ultrathin transducer and its potential in electronics, photonics and sensing [3]. At the same time, graphene's lack of a conventional bandgap in pristine form complicates its direct use in digital logic, where strong current modulation is required. Bandgap engineering, patterned graphene, heterostructures and integration with other two-dimensional semiconductors are therefore active areas. Graphene also has a strong role in energy technologies. Graphene and graphene-derived materials can provide conductive networks and high-surface-area interfaces in batteries, supercapacitors and other electrochemical systems [4]. Commercialization evidence suggests that energy storage and polymer composites have, so far, been more prominent than mass-market graphene logic electronics [1]. This distinction is important for an international review: technological potential should be separated from demonstrated industrial adoption.

For India, graphene research could be strategically linked with sensors, flexible electronics, electromagnetic shielding, energy storage and advanced composites. The most realistic near-term pathway is likely hybridization with existing materials and manufacturing rather than a complete replacement of silicon.

Quantum Dots: Quantum Confinement for Tunable Optoelectronics

Quantum dots (QDs) are semiconductor nanocrystals small enough that quantum confinement strongly influences their electronic and optical behaviour. Changing the particle size can shift the energy levels and therefore the wavelength of absorption or emission. This size-dependent tunability is one of the most powerful features of QDs and underpins applications in displays, light-emitting devices, photodetectors, imaging and photovoltaics. Quantum-dot light-emitting diodes are particularly important for display technologies. Recent reviews describe QD-LEDs as attractive because of their colour accuracy, brightness and solution-processable fabrication, while also identifying challenges in stability and blue-emitting device lifetime [5]. The commercial history of quantum-dot-enhanced displays demonstrates that QD materials have already crossed an important part of the laboratory-to-market pathway. However, the material chemistry matters: some high-performance QDs contain heavy metals such as cadmium, creating environmental and regulatory concerns. Development of cadmium-free alternatives and improved encapsulation is therefore essential. In photovoltaics, QDs can extend light harvesting and provide tunable energy levels. Their optical properties can be adjusted through particle size and surface chemistry, while ligand engineering can improve charge transport and reduce trap-mediated recombination. Perovskite QDs represent a related and rapidly developing class in which quantum confinement is combined with the favourable optoelectronic characteristics of perovskite materials [6,7]. These systems may enable thin, lightweight and spectrally tunable photovoltaic devices. For India, QDs are relevant to high-quality displays, optical sensors, photodetectors and specialized solar technologies. Their future sustainability will depend on safer compositions, reproducible synthesis, surface control, recovery and recycling.

Perovskite Thin Films: A Major Route to Green Energy

Metal-halide perovskites have emerged as one of the fastest-developing photovoltaic material families. Their strong absorption, tunable bandgaps, long carrier diffusion lengths and compatibility with thin-film processing make them attractive for lightweight and potentially low-material-use solar devices. Perovskite absorbers can also be deposited on silicon, enabling tandem architectures that use different portions of the solar spectrum more effectively. Recent literature shows the speed of progress. A 2026 review of advances

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

during 2025 reported laboratory efficiencies of about 27% for single-junction perovskite solar cells and above 34.5% for perovskite–silicon tandems [8]. A 2025 review of perovskite-based multijunction cells also highlighted the potential of bandgap engineering and tandem configurations to exceed the limitations of conventional single-junction devices [9]. These numbers are laboratory achievements and should not be interpreted as commercial module efficiencies. The principal obstacle is stability. Moisture, oxygen, heat, illumination, electrical bias, ion migration and mechanical stress can degrade perovskite devices. Reviews of long-term operating stability emphasize that stability remains a central issue even after major efficiency gains [10]. Industrialization also requires uniform large-area coating, reproducibility, encapsulation, lower manufacturing cost and environmentally responsible materials management [11]. Lead-containing perovskites create an additional concern because safe containment, recycling and end-of-life management are essential. Lead-free alternatives, particularly tin-based systems, are actively investigated but currently face efficiency and stability trade-offs [12].

Perovskite thin films should therefore be viewed as a high-potential technology whose commercial trajectory depends on solving reliability and lifecycle problems. Their strongest strategic role may be as a complementary top cell in tandem systems, lightweight solar modules and specialized applications where thinness and spectral engineering provide clear advantages.

Figure 3. Methodology Flowchart

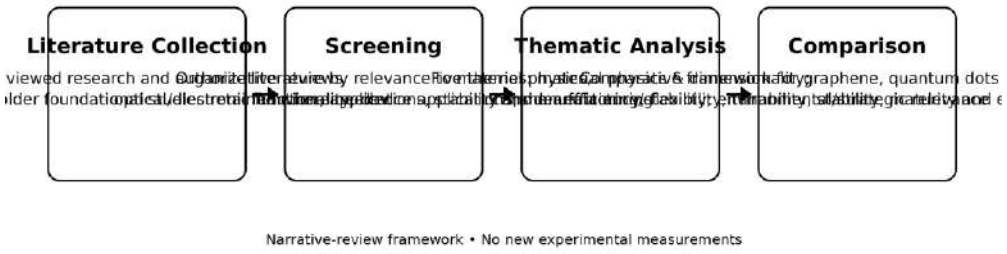

Figure 3. Methodology Flowchart: literature collection (2020–2026), screening, thematic analysis and comparison. Schematics are illustrative and intended to explain operating principles.

Methodology and Theoretical Framework

This article adopts a structured narrative-review methodology. Peer-reviewed research and authoritative review literature published mainly from 2020 to 2026 were examined, with older foundational studies retained where necessary to explain core physical concepts. The literature was grouped into five themes: (i) material physics and dimensionality, (ii) electronic and optical functionality, (iii) device applications, (iv) manufacturing and stability, and (v) environmental and strategic relevance. The theoretical framework is based on the principle that nanoscale functionality emerges from the interaction between structure, size, interfaces and device architecture. Graphene represents a two-dimensional transport and surface platform; QDs represent zero-dimensional quantum-confined systems; and perovskite thin films represent strongly absorbing, compositionally tunable semiconductor layers. The comparison therefore considers not only efficiency but also flexibility, tunability, stability, manufacturing maturity and environmental requirements. No new experimental measurements are claimed. Numerical performance values quoted in this review are literature-reported values and are cited to their sources. Figure 2 is a qualitative comparison intended to organize technological attributes rather than to present a universal quantitative ranking.**Results and Discussion: Comparative Assessment**

Figure: Schematic diagrams and representative electronic/optoelectronic characteristics for (1) GFET, (2) QD-LED, and (3) QD photodetector.

Figure 2. Representative device circuits and characteristics for graphene field-effect transistors, quantum-dot light-emitting diodes, and quantum-dot photodetectors. Schematics are illustrative and intended to explain operating principles.

The comparison indicates that the three material families are complementary rather than interchangeable. Graphene is strongest where conductivity, transparency, mechanical flexibility and surface sensitivity are valuable. QDs are strongest where optical spectra need to be engineered through nanoscale dimensions and surface chemistry. Perovskites are strongest where efficient light absorption and tunable bandgaps are required in thin-film photovoltaic or optoelectronic architectures. Graphene's main weakness for conventional digital logic is the absence of a natural bandgap in pristine material. QDs face challenges associated with surface traps, material toxicity for some compositions and long-term device stability. Perovskites face the most prominent reliability and scale-up challenge, despite exceptionally rapid progress in efficiency. The most important result of the comparative framework is therefore a systems-level conclusion: the future beyond silicon is likely to be heterogeneous. Silicon can remain the mature electronic and photovoltaic backbone, while nanomaterials provide specialized functions. Examples include graphene/silicon photodetectors, QD-enhanced optical devices and perovskite/silicon tandem solar cells. Such hybrid architectures reduce the requirement for any one material to perform every function.

Relevance to Viksit Bharat 2047

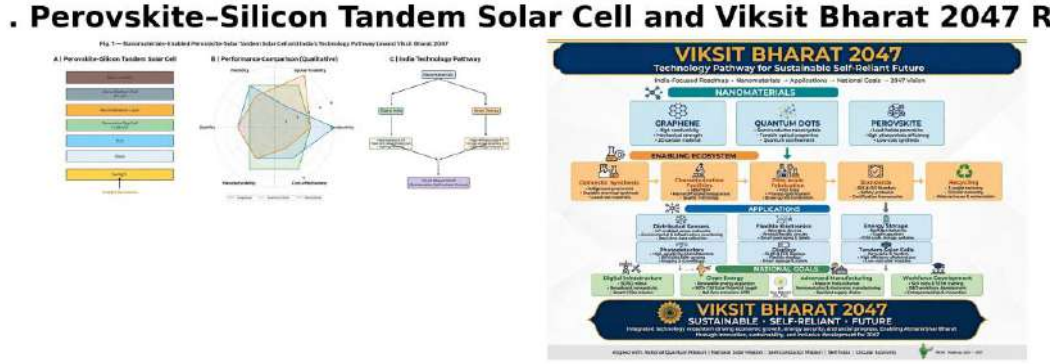

Figure 4. Perovskite–silicon tandem solar cell and Viksit Bharat 2047 technology roadmap. Schematics are illustrative and intended to explain operating principles.

India's long-term development goals require simultaneous progress in digital infrastructure, clean energy, advanced manufacturing, scientific capability and sustainable resource use.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Nanomaterials can contribute to these priorities when research is connected to scalable manufacturing and workforce development. First, graphene-based sensors and conductive layers could support distributed sensing, environmental monitoring, flexible electronics and energy-storage systems. Second, quantum-dot technologies can strengthen high-quality display, optical sensing and photodetection capabilities. Third, perovskite thin films can expand the design space for solar generation through lightweight modules and tandem cells. The latter is particularly relevant to India's strong solar-energy potential, but deployment must be accompanied by robust durability testing and end-of-life management. A Viksit Bharat-oriented nanomaterials strategy should therefore emphasize domestic synthesis, characterization facilities, pilot-scale coating and device fabrication, standards, recycling pathways, and industry–academic partnerships. Public research programs can focus not only on peak laboratory efficiency but also on reproducibility, lifetime, embodied energy, material recovery and manufacturability. This approach would turn nanomaterials from isolated laboratory achievements into components of a broader advanced-materials ecosystem.

Challenges and Future Directions

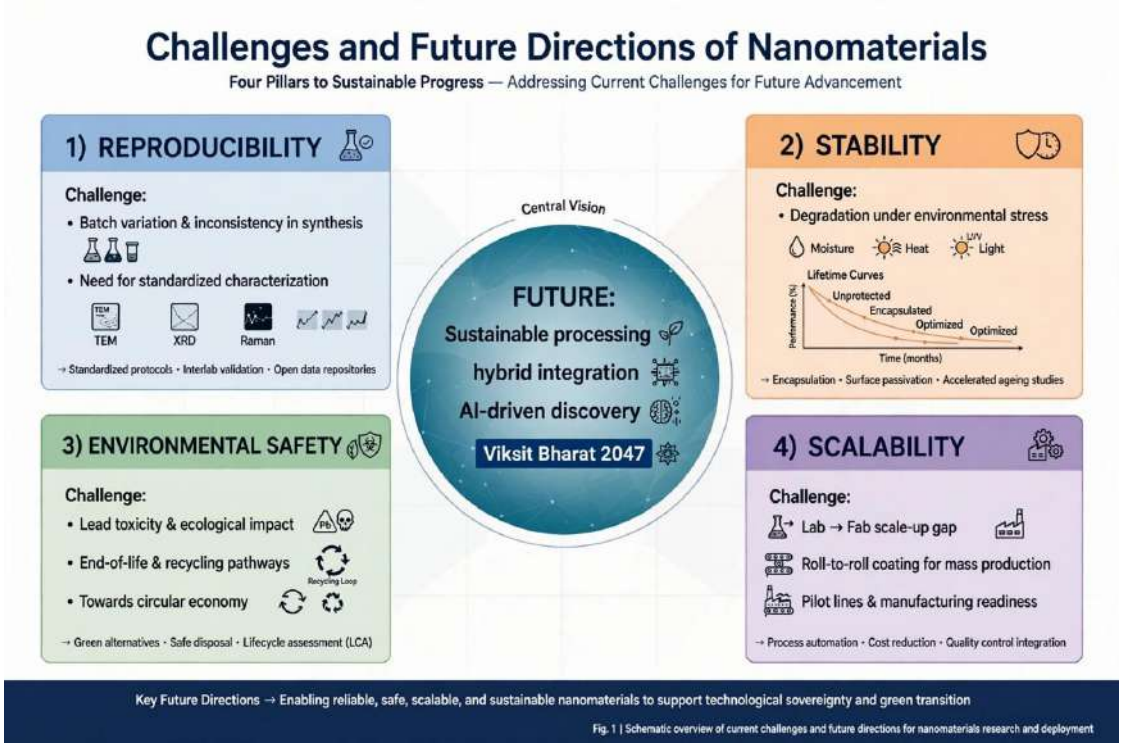

Figure 5. Challenges and future directions of nanomaterials: reproducibility, stability, environmental safety and scalability.

Schematics are illustrative and intended to explain operating principles. Several cross-cutting challenges must be solved before large-scale deployment. The first is reproducibility. Nanomaterials are sensitive to synthesis conditions, impurities, defects, surface chemistry and interfaces, so batch-to-batch variation can strongly affect device performance. Standardized characterization and reporting are essential. The second is stability. Graphene devices may suffer from transfer contamination or contact limitations; QDs may experience surface degradation and ligand-related charge-transport problems; and perovskites can degrade under combined environmental and electrical stress. Stability protocols should therefore use realistic operating conditions and long-duration tests rather than short laboratory demonstrations alone. The third is environmental responsibility. Materials selection should consider toxicity, solvent use, resource intensity, recycling and end-of-life treatment. For perovskites, lead containment and recovery are particularly important. For QDs, cadmium-free chemistries deserve continued development. The fourth is manufacturing. Thin-film deposition, printing, coating, encapsulation and integration must move from small-area demonstrations to reliable large-area processes. Recent work on perovskite/silicon tandems emphasizes efficiency, stability and scalability as interconnected

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

requirements [13]. Similar systems thinking is needed for graphene and QD technologies. Future research should focus on heterostructures, interface engineering, AI-assisted materials discovery, sustainable solvents, low-temperature processing, scalable deposition and lifecycle assessment. The most valuable innovations will be those that improve several performance dimensions simultaneously.

Conclusion

Graphene, quantum dots and perovskite thin films illustrate three distinct ways in which nanomaterials can extend the capabilities of silicon-era technology. Graphene provides a highly conductive, flexible and surface-sensitive two-dimensional platform; quantum dots provide nanoscale control over light absorption and emission; and perovskite thin films provide strong and tunable light absorption for next-generation photovoltaics and optoelectronics. The evidence reviewed here does not support the idea that one of these materials will simply replace silicon. Instead, the stronger scientific and engineering pathway is complementary integration. Silicon supplies a mature industrial foundation, while nanomaterials add functions that are difficult to obtain from conventional materials alone. Perovskite–silicon tandems are a clear example of this philosophy, while graphene and QDs offer additional opportunities in sensing, photonics, displays and energy systems. For India, the opportunity extends beyond adopting imported devices. Building domestic capability in nanomaterial synthesis, thin-film processing, characterization, reliability testing, recycling and advanced manufacturing could strengthen technological self-reliance and create new research-to-industry pathways. Achieving these outcomes requires a balanced approach that values efficiency together with lifetime, safety, scalability and lifecycle sustainability.

Nanomaterials beyond silicon should therefore be understood not as a single replacement technology but as a platform for a more diverse, efficient and potentially sustainable technological future. With coordinated research and responsible commercialization, graphene, quantum dots and perovskite thin films can become important contributors to India's digital transformation and clean-energy transition toward 2047.

Table 1. Comparative properties and applications

Material	Core nanoscale feature	Key strengths	Representative applications	Main challenges	India relevance
Graphene	2D atomic carbon lattice	Conductivity, transparency, strength, surface sensitivity	Sensors, flexible electronics, photodetectors, energy storage	Bandgap/control, integration, scale-up	Sensors, flexible devices, energy systems
Quantum dots	0D quantum confinement	Tunable absorption/emission, solution processing	Displays, LEDs, photodetectors, photovoltaics	Surface traps, stability, heavy-metal concerns for some QDs	Displays, sensing, optoelectronics
Perovskite thin films	Tunable semiconductor thin film	Strong absorption, tunable bandgap, thin-film processing	Solar cells, tandem PV, LEDs	Stability, scale-up, lead management	Solar power, tandem PV, advanced manufacturing

Abstract:

The downtrodden and their suffering are the main issues handled by authors. Dalit literature is the evidence of Dalit community arduous efforts for existence. The intention of Dalit authors to reveal the plight of the oppressed community and Dr. Babasaheb Ambedkar countless efforts to bring them out mainstream. Nowadays number of Dalit writer's centering the ideas of Ambedkar's philosophy and ideology. The main objective of Dalit writing is Dalit people should be treated with respect and dignity. Babytai's writing is a testimony of the pivotal position of Dr. Babasaheb Ambedkar in shaping Indian Dalit thoughts and customs. He had played a vital role to transform Dalits which is kindly observed in their writing. Thus, through this research paper, an attempt has been made to bring forth the arduous efforts of Dr. Babasaheb Ambedkar to change the condition of Dalit community especially women.

Keywords: *Existence, downtrodden, exploitation, arduous efforts, philosophy.*

Babytai Kamble is the first Dalit woman who paved the way for her feelings. She wrote the first Dalit women autobiography considered as a socio-biography rather than an autobiography. Babytai became the mouthpiece of Dalit community. Novelty of this autobiography is that it paid less attention to personal life despite highlighting the Dalit communities suffering and struggle for existence. Babytai divided her writing into two major parts. One side she explored was the miserable condition of her community which had never changed from centuries. Alternatively, in the second part she paid attention to the vital role of Dr. Babasaheb Ambedkar to uplift the condition of the Dalit. Her autobiography described the lives of Dalit community and their struggles such as social, political, economical and cultural for their existence. Her autobiography not only shows physical, emotional and psychological exploitation and violence of her community but also shows how Dalit community gradually moved towards transformation. Dr. Babasaheb Ambedkar became the pillar of their transformation. Her writing shows her appreciativeness and contentment towards Dr. Babasaheb Ambedkar and his countless efforts. Babytai Kamble's autobiography *The Prisons We Broke* is the landmark of Dalit literature. This autobiographical work is divided into eleven chapters without following any chronological order. The narrator highlights the incidents according to their depthness and necessity. She never felt ashamed to highlight the traditions, rituals, superstitions. Poverty and illiteracy were the main treasure Dalit community houses. Rarest people if her community had been working on the lowest job given by the British government. Baby Kamble's father was a contractor. She spent her childhood with her maternal grandparents, it was good as compared to other girls in her community. During those days, most of the people suffered from poverty. She described ironically the things that decorate Dalit houses. She says: The walls were nothing but stones arranged vertically with some mud coating. They were tiny huts really. There would be a big clay pot with a small mouth kept at the entrance for drinking water. The pot was called Keli. The mouth would be covered with a broken coconut shell that also served as a cup for drinking water.

Website: https://bnir.us

It had three holes at the bottom. One corner of the hut would have a clay chulha near which lay a couple of clay pots, a wooden pali, and a tawa. The centre of the tawa would usually be burnt out so there would be a big hole in the middle. Above the chulha would hang a long string called walni. These strings had to be there because on these strings we would hang the intestines of dead animals in order to dry them! (7-8). After describing these conditions, Babytai couldn't accuse them because to survive in poverty was the main question in front of them. furthermore, she raised the question how these people dreamt of luxurious life and become well educated. To complete the basic needs was the biggest question they faced from their ancestors. They never thought that the dominant group of society humiliated and oppressed them in various ways. They accepted this exploitation as a faith or destiny. Dalit women were symbols of hard work and exploitation. They were unpaid servants of the family as well society. Babytai gave several examples of their exploitation and how their husband had beaten them for some flimsy reason. How they worked hard for their family. As compared to cities, village women operation doesn't come to light because male dominance is keenly observed in day-to-day existence. She compared Dalit women condition to upper caste women and differentiated discrimination in three folds: being women, being a lower caste, being poor. Narrator describes various grounds on which women suffer. Marriage at an early age is one of them. Similarly, these issues handled by Aarti Vishwakarma in her article "Depiction of Plight and Subjugation of Dalit Women in Baby Kamble's The Prisons We Broke" gives the reference of women condition. She pointed out that:
She says, "A Mahar woman would continue to give birth till she reached menopause" (82)

During her pregnancy and delivery, she didn't get sufficient food to eat. The subsequent pregnancies deteriorate her physical health as she falls victim to malnourishment. On the other side, men were engaged in work. They were permanent servants of the upper caste community. If they made a single mistake, they got unbearable punishment. Though they work dedicatedly, they are inadequate to provide sufficient food to their family. She became desperate and said, this was the pathetic condition of her community. No novelty, no ray of hope, no positivity. She says: What kind of life did these people really lead? What was there worth living for? (11) These people blindly trust in God and goddesses to pull them out from their suffering. Give them some blessing. But all prayers were empty and meaningless. "We kept praying to god for a little comfort, which never came our way. We smeared our foreheads with earth and finally the same earth took us into her arms: in the end, we merged with mother earth (44)." She portrayed the picture of her community and their condition. "We were just like animals but without tails. We could be called human only because we had two legs instead of four. There was no difference between us and the animals" (49). She compared her community people life with bullocks, and said our condition was the worst of them. At least they got sufficient food and a place to stay but we didn't. We built our houses where people threw the garbage and waste material. Who had protected our rights. We fought with **dogs, cats vultures to establish our rights. Furthermore, she implies:**
"We were imprisoned in dark cells, our hands and feet bound by the chain of slavery" (49).

During this wretched condition a beacon of hope came in the form of Dr. Babasaheb Ambedkar. He was a revolutionary figure who fought for injustice. He created awareness in Dalits mind. He shook their brains, woke them from sleep and urged them to think about themselves. Through his speeches he asked several questions to spread awareness in society. He wrote several books that gave the idea to society how they can spend their life with dignity and respect. Dr. Ramesh Kamble's article "Dr. Ambedkar & Upliftment of Dalit Women" he explores the unconventional mindset and optimistic approach of Dr. Babasaheb Ambedkar. He pointed out that his revolutionary speech brought a renaissance in the lives of Dalit, especially women. Through his article he indicates: It is important to note that under the leadership of Dr. Babasaheb Ambedkar, the Dalit women took active part in Dalit Movement on several occasions. Until and unless there is an improvement in the status of Dalit women and their equal participation in the society, all talk of nation's progress and development is meaningless. (51) He was cognizant of the role played by women in the house and society. Through his various

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

movements he openly challenged to establish the norms in society. Dalit people realised their ignorance and dependency. They felt humiliating treatment given by the upper caste community to them. People actively **participated in his movement. She illustrates these oppressed people firmly believed that:**

The three qualities merged and were realised in the form of Dr. Babasaheb Ambedkar. He was our Baliraja who gave away his kingdom for Truth. He was our Buddha who taught love, Brotherhood and equality unto all. He was our Bhim, our king and our saviour, who blessed the blind with sight. He was the weapon forged out of the perfect blend of the three qualities of character, truth and morality, to fight injustice and to break the chains of slavery that shackled our feet. (104) Babytai depicted the influence of Ambedkarian thoughts on Indian Dalits psyche. He delivered the speech and showed them the hypocrisy of society. People actively participated in various movements launched by Babasaheb. People tried to implement his thoughts and improve their social conditions. The narrator emphasized peoples' judgement after hearing his speech. She says: People began to change slowly but steadily. They began to be aware. Parents now discarded the loincloth for their children and began dressing them up in pajamas. They began cutting the hair of their young daughters. They rejected to believe in god and religion. Young men began to argue about the custom of eating dead animals. (69)

She admitted that for centuries these people were enslaved by the dominant group. But now they have a strength to fight for injustice. Babasaheb's speeches gave them strength and they were ready to transform themselves. Babytai said that in chawdi the whole day people discussed Babasaheb thoughts.

"My aaja spoke as if he was drunk with happiness. He would gather people in the chawdi and repeat to them what Babasaheb had said in the meeting. He said to people that His words have rent my heart" (66).

Through her writing the narrator expresses her gratitude towards Dr. Babasaheb Ambedkar and didn't forget to mention his efforts to uplift the condition of her community. She confessed in her writing that Babasaheb had taken major decisions for women empowerment when he was a law minister. She purposely highlighted the Hindu Code Bill and Babasaheb's countless efforts to sanction this bill. When the bills were defeated in the assembly instantly Babasaheb resigned his position. This incident denoted his endeavouring to fight against injustice and women liberation. Same issue held by Suma Priyadarshini. B K. in her article "Babasaheb Ambedkar: The Soul of Dalit Consciousness". She gives the reference of various decisions taken by Dr. Babasaheb Ambedkar. She says:

He introduced The Hindu code bill in parliament giving equal property rights to women and resigned when the bill was not passed in 1951.

Today I take pride in saying that I am Dalit and a woman who is independent in mind and spirit because of Babasaheb's contribution to the welfare of women folk. (113) She knew the necessity and importance of this task handled by Babasaheb. He came to know that if women got specific rights, then she can stand for herself and raised the questions for her identity. The narrator revealed Babasaheb's loyalty and zeal towards Dalit. He was a voice of oppressed, he was an emancipator of downtrodden community. She says: "His heart was soft and tender, full of love for the downtrodden" (120).

Babytai praised his diligent and bravery how a single man achieved this impossible task. She says:

He is far greater to us than the maker of the universe. Was there anything that he did not do for us? First, he gave us life; then he made us human beings. The first need of a human being is education. He made it possible for us to receive education; he even spent his own money for that. He encouraged us to be graduates. He helped us obtain prestigious jobs. He made our households rich. He empowered us to obtain wealth and power. He demonstrated to the whole world that we had the ability to reach the highest position; that we could even be ministers. He strived hard and brought comfort to our doorstep. (118)

Conclusion:

Dalit community is the largest community in Maharashtra. Dr. Babasaheb Ambedkar is an inseparable part of oppressed lives. we can't study Dalit literature without taking the reference of Babasaheb. The narrator herself belonged to this community, no doubt all were lively experiences faced by narrator and her family. An Autobiography reached zenith because she admitted that for them the marvellous task succeeded by Babasaheb without any anticipation.

Abstract

This research paper investigates the profound intersections of travel, banishment, and memory within the literary universe of Salman Rushdie. Traditional definitions of national identity fail to capture the fluid realities of modern displaced populations. By deploying a qualitative text-based analysis of major novels including Midnight's Children, The Satanic Verses, and The Moor's Last Sigh, this study explores how geographic dislocation acts as a psychological catalyst for self-redefinition. Grounded in postcolonial frameworks established by theorists like Homi Bhabha, Edward Said, and Stuart Hall, the investigation tracks the evolution from the initial trauma of uprooting toward adaptive global citizenship. The findings reveal that Rushdie reconfigures forced exile from a permanent loss into a dynamic source of creative productivity. The constructed "imaginary homeland" serves as a crucial mental anchor, helping migrants survive cultural friction in foreign landscapes. Ultimately, the research demonstrates that hybridity operates not as a weakness, but as a resilient form of resistance against monolithic nationalisms. These insights offer valuable perspectives on contemporary transnational migration, illustrating how flexible, multifaceted identities empower individuals to thrive in an interconnected world.

Keywords; *Salman Rushdie, Diasporic Identity, Exile, Hybridity, Imaginary Homeland, Belonging*

Introduction

Salman Rushdie stands as a central figure in postcolonial and diasporic writing. His life story and artistic output spring directly from the realities of migration. Moving between continents shaped his unique worldview, placing him at the crossroads of different cultures, languages, and belief systems. Conventional, inflexible ideas about national borders and fixed belonging struggle to explain the reality of modern life. Today, millions of people cross international boundaries for various reasons, creating a world where static categories fall short. Traditional frameworks assume a person belongs entirely to one specific territory. Yet, contemporary global citizens frequently inhabit multiple worlds at once, carrying memories of their homelands while adapting to entirely new societies. This academic framework explores how Rushdie's stories treat travel and physical banishment beyond mere geographical relocation. Instead of viewing exile solely as a tragedy or a physical shift, his work frames displacement as a powerful mental catalyst. Movement forces characters to confront internal transformations, shedding old certainties and embracing fluid identities. Through his novels, movement becomes a tool for reimagining selfhood. Characters navigating foreign landscapes experience cultural translation, where they must interpret and reinterpret their values to fit unfamiliar environments. This continuous negotiation creates hybrid identities—rich psychological states where diverse traditions blend seamlessly rather than cancel each other out. Ultimately, Rushdie demonstrates that losing a fixed homeland does not mean losing one's essence; rather, it opens the door to a broader, more adaptable human experience.

Objectives of the study

- To examine how physical travel and involuntary exile influence the psychological landscapes of Rushdie's characters.

- To analyze the concept of the "imaginary homeland" and its role in sustaining cultural memory and a sense of belonging.
- To investigate how hybridity functions as both a source of alienation and a form of empowerment for the diasporic subject.
- To evaluate the narrative techniques Rushdie employs to mirror the fragmented reality of diaspora.

Literature Review

Academic inquiry into migration begins by engaging with foundational thinkers who mapped out the modern condition of displacement. Homi Bhabha offers a vital lens through his concept of hybridity and the "third space." Instead of viewing different cultures as pure or separate entities, Bhabha argues that interaction breeds a productive middle ground where new cultural meaning emerges. This space allows individuals to negotiate conflicting traditions without surrendering their distinct histories. Edward Said provides another pillar by examining exile not just as a physical state, but as a profound psychological condition. Said views banishment as an unbridgeable rift between a human being and a native soil, creating a permanent state of restlessness. Meanwhile, Stuart Hall addresses cultural identity and diaspora, defining identity not as a fixed essence waiting to be uncovered, but as an ongoing process of becoming. Hall emphasizes that displaced communities constantly construct and reconstruct their roots through memory, media, and interaction with host nations. Together, these frameworks establish that moving across borders alters consciousness deeply. Scholars have long analyzed Salman Rushdie's fiction through the lenses of migration, identity, and rootlessness. Critics frequently examine how his characters grapple with the loss of their homelands, often trapped between nostalgia for the past and the demands of an alien present. Academic discussions typically highlight magical realism as his primary tool for capturing the fragmented nature of the migrant consciousness. Researchers have documented how his novels challenge single-minded nationalisms, offering instead a celebration of mongrelized, mixed cultures. Much of the prior commentary focuses heavily on postmodern aesthetics—such as playful irony, fractured timelines, and intertextual references—showing how narrative style mirrors the chaotic reality of the globalized subject. Despite abundant literary criticism surrounding Rushdie, a noticeable gap remains within current scholarship. While plenty of analyses tackle his postmodern techniques and general themes of homelessness, fewer studies systematically trace the precise evolution from forced banishment to fluid belonging across his major books. Most existing critiques tend to isolate individual texts rather than mapping a continuous progression in how his characters learn to inhabit the world. This study addresses that omission by charting a clear trajectory across multiple novels, demonstrating how physical uprooting gradually transforms into a comfortable, flexible sense of home.

Methodology

This investigation employs a qualitative and text-based literary evaluation grounded in postcolonial and cultural studies frameworks. By utilizing these theoretical lenses, the study examines how fictional texts mirror broader societal shifts concerning global movement, borders, and psychological adaptation. The core corpus centers on three major novels by Salman Rushdie: *Midnight's Children*, *The Satanic Verses*, *The Moor's Last Sigh*. These specific texts offer a rich narrative timeline to track how characters transition from historical rootlessness toward integrated, multifaceted forms of belonging. To support the core arguments, the project draws upon a wide range of external materials. These comprise peer-reviewed academic journals, scholarly monographs on postcolonial criticism, critical essay collections, and recorded interviews given by the writer over the decades. These supplementary texts provide context regarding the artistic motivations and historical backdrops influencing the books. The operational strategy relies heavily on close reading techniques. This method involves dissecting textual passages word by word to uncover deeper meanings. Attention focuses specifically on recurring thematic motifs such as physical journeys, crossing national boundaries, the role of nostalgia, and hybrid cultural symbols. Rather than treating these elements as mere background decorations, the examination explores them as structural drivers that shape character development. Through meticulous text scrutiny, the research maps out the exact linguistic and narrative shifts that transform initial geographic dislocation into a confident, adaptive state of global citizenship.

Detailed Analysis of Displacement and Identity

Physical relocation often strikes characters with sudden, overwhelming emotional turbulence. Leaving behind familiar streets, native languages, and family structures triggers an immediate psychological crisis. Uprooted individuals experience a deep sense of disorientation upon arriving in foreign environments. This initial phase involves wrestling with grief, alienation, and a

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

profound loss of stability. The trauma is not merely physical distance from a birthplace; it is the sudden severance of personal history and social anchors, leaving characters struggling to find their footing in unfamiliar territory. Facing this profound rupture, displaced people attempt to piece together what they left behind through the power of recollection. Memory serves as both a sanctuary and an illusion. Instead of objective truth, characters rely on fragmented recollections, myths, and personal storytelling to recreate vanished landscapes. A prominent example appears in *Midnight's Children*, where Saleem Sinai famously reflects that memory selects, reinvents, and exaggerates the past. This process creates an "imaginary homeland." Individuals cling to idealized versions of their origins to cope with present alienation. Yet, these mental blueprints remain inherently unstable, shifting constantly alongside the emotional needs of the migrant. When Eastern and Western worlds crash together within these narratives, a fascinating transformation takes place. Characters caught between distinct cultural spheres undergo deep mutations in self-perception. A prime illustration unfolds in *The Satanic Verses*, tracking the contrasting trajectories of Gibreel Farishta and Saladin Chamcha. As they navigate British society after leaving India, their identities fracture and rebuild. This friction generates what theorist Homi Bhabha terms the "third space"—a zone of cultural syncretism where pure categories dissolve. Rather than fully assimilating or remaining entirely isolated, characters absorb diverse elements from both cultural realms. This blending produces hybrid personalities capable of navigating multiple realities. Ultimately, the fiction demonstrates that surviving displacement requires letting go of rigid attachments to a single heritage. By embracing cultural fluidity, uprooted subjects forge resilient, multifaceted identities equipped to thrive in a globalized era.

Discussion

Evaluating these literary works shatters the old binary separating insiders from outsiders. Conventional thinking assumes that a person must claim allegiance to one specific piece of land to feel secure. The examined texts prove that true comfort for the diaspora is fluid rather than anchored to a permanent geographical point. Migrants build homes out of memories, language, and shared experiences instead of physical soil. This flexibility allows displaced populations to feel connected to multiple places simultaneously, rendering traditional national boundaries obsolete. People no longer need to choose a single flag or culture to define who they are; instead, they occupy a broader spectrum of global citizenship. Living without deep roots carries a heavy burden, creating an ongoing conflict between suffering and freedom. On one side, losing a native land brings deep psychological wounds, leaving individuals feeling adrift, lonely, and disconnected. This form of rootlessness registers as an acute trauma, a constant ache for a past that cannot be recovered. Conversely, the exact same condition can act as an empowering, cosmopolitan stance. Unshackled from local traditions and narrow nationalisms, the migrant gains the liberty to critique multiple societies with a clear, unbiased perspective. This dual nature shows that detachment is neither entirely tragic nor purely advantageous; it remains a complex psychological state filled with both pain and potential. Connecting these literary motifs to real-world migration patterns reveals profound parallels with contemporary life. In our era of massive global movement—driven by economic shifts, political conflicts, and climate change—millions experience the exact psychological transformations depicted in fiction. Transnational citizenship is no longer a rare academic theory; it is a daily reality for countless individuals who maintain digital ties to home while navigating foreign workplaces. Rushdie's narratives act as a mirror for modern civilization, demonstrating that human identity thrives best when it remains adaptable. Embracing hybridity helps societies move past rigid tribalism, offering a hopeful blueprint for peaceful coexistence in an interconnected world.

Research Results and Key Findings

The investigation yields three core discoveries regarding how literature interprets modern relocation. First, the novels successfully reframe banishment. Instead of portraying geographical uprooting as a permanent tragedy, the narratives present it as a fertile ground for creative energy. Authorship and artistic expression flourish when individuals look at societies from an outside vantage point. Second, the concept of the "imaginary homeland" functions as an essential mental support system. Because physical return is often impossible, migrants rely on reconstructed memories and storytelling to preserve their sanity and emotional balance. This internal refuge gives them the strength required to endure cultural dislocation in foreign surroundings. Finally, blended identities operate as a powerful tool against strict, narrow nationalisms. Rather than showing hybridity as a vulnerable or confused state, the stories highlight mixed cultural backgrounds as a resilient shield. Embracing diverse influences allows individuals to reject rigid

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

state control and assert a free, multifaceted existence.

Conclusion

This investigation demonstrates how travel, banishment, and recollection merge within Salman Rushdie's literary universe. Rather than accepting passive victimhood, his characters transform geographic disruption into an engine for building resilient, multifaceted personalities. By weaving together memories of native lands with the realities of foreign environments, uprooted individuals successfully navigate fractured lives without losing their fundamental sense of self. The author's imaginative output retains profound relevance today, offering crucial insights into modern global mobility and international border pressures. As millions continue moving across the planet due to conflict, economic opportunity, or environmental shifts, the psychological struggles captured in these novels echo loudly in real life. Understanding how fiction addresses these dilemmas provides a compassionate lens for viewing contemporary transnational citizens who juggle multiple allegiances every day. Scholars can expand upon these findings by exploring new dimensions of migrant life. One promising path involves investigating digital diasporas, where internet connectivity and social media alter how communities maintain virtual links to their ancestral homes. Another valuable direction entails analyzing Rushdie's later books through the lens of late-stage globalization, assessing how rapid technological connectivity and shifting political climates impact the modern cosmopolitan outlook.

Abstract

Agriculture is the principal economic activity and the primary source of livelihood for the majority of the population in Mudkhed Taluka of Nanded District, Maharashtra. The agricultural land-use pattern of the region is shaped by a combination of physical, climatic, socio-economic, and technological factors. The present study examines the spatial distribution of agricultural land use, cropping pattern, irrigation facilities, and the major agricultural challenges affecting agricultural productivity in Mudkhed Taluka. The study aims to understand how land resources are utilized for agricultural purposes and to evaluate the role of irrigation and other supporting factors in agricultural development.The research is based on secondary data collected from the Census of India, District Statistical Abstracts, Agricultural Department reports, Revenue records, and other government publications. Field observations and village-level information were also used to support the analysis. Statistical techniques such as percentage analysis, comparative analysis, and cartographic methods were employed to interpret the data and identify spatial variations in agricultural land use.The findings reveal that a substantial proportion of the total geographical area of Mudkhed Taluka is devoted to agriculture, indicating the dominance of the agricultural sector in the regional economy. Soybean, cotton, tur, jowar, wheat, and gram are the major crops cultivated in the taluka, with cotton and soybean emerging as important commercial crops due to favorable black cotton soils and market demand. The study also highlights the growing importance of irrigation through wells, borewells, and farm ponds in improving agricultural productivity. However, a large area still depends on monsoon rainfall, making agriculture vulnerable to climatic uncertainties.The study further identifies several challenges, including irregular rainfall, groundwater depletion, rising input costs, fragmented landholdings, inadequate irrigation coverage, and fluctuations in market prices. These issues adversely affect crop production and farmers' income. The research emphasizes the need for sustainable agricultural land management, efficient water-resource utilization, crop diversification, watershed development, and the adoption of modern agricultural technologies. The implementation of these measures can enhance agricultural productivity, ensure long-term sustainability, and improve the socio-economic conditions of farmers in Mudkhed Taluka. The study provides valuable insights for planners, policymakers, researchers, and agricultural administrators in formulating effective strategies for sustainable agricultural development in the region.

Keywords: *Agricultural Land Use, Cropping Pattern, Irrigation, Mudkhed Taluka, Agricultural Geography*

Introduction

Agricultural land use represents the dynamic relationship between human activities and the natural environment, reflecting how land resources are utilized to meet the food, economic, and livelihood needs of society. Agriculture is one of the most important sectors of the Indian economy and plays a vital role in rural development, employment generation, and food security. The pattern of agricultural land use varies from region to region depending upon physical factors such as climate,

soil, topography, water availability, and socio-economic factors including population pressure, market accessibility, technological advancement, and government policies.Mudkhed Taluka of Nanded District is predominantly an agrarian region where agriculture serves as the principal occupation of the majority of the population. The taluka is characterized by fertile black cotton soils, a semi-arid climate, and dependence on monsoon rainfall. These natural conditions have significantly influenced the development of agricultural activities and cropping patterns in the region. Major crops such as soybean, cotton, tur, jowar, wheat, and gram are cultivated extensively and contribute substantially to the local economy. In recent years, improvements in irrigation facilities, agricultural inputs, and farming technologies have brought noticeable changes in land-use practices and crop productivity.Despite its agricultural importance, the region faces several challenges, including irregular rainfall, recurrent drought conditions, declining groundwater levels, increasing production costs, and fragmented landholdings. These factors directly affect agricultural productivity and the socio-economic well-being of farmers. Therefore, a detailed study of agricultural land use is necessary to understand the existing pattern of land utilization, cropping distribution, irrigation status, and agricultural development of the taluka.The present study attempts to analyze the agricultural land-use pattern of Mudkhed Taluka and examine the factors influencing agricultural development. It also evaluates the role of irrigation, identifies major agricultural problems, and suggests suitable measures for sustainable agricultural growth. The findings of the study are expected to contribute to regional planning, agricultural policy formulation, and sustainable resource management in the study area.

Study Area

Mudkhed Taluka is located in the central part of Nanded District in the Marathwada region of Maharashtra. It is predominantly a rural area where agriculture constitutes the backbone of the local economy and provides livelihood to a large proportion of the population. The taluka is well connected by road and rail networks and serves as an important agricultural region within the district. Mudkhed town acts as the administrative headquarters and functions as a commercial center for the surrounding villages.The physical environment of Mudkhed Taluka is highly conducive to agricultural activities. The region is characterized by fertile black cotton soils (Regur soils), which are rich in nutrients and possess high moisture-retention capacity. These soils are particularly suitable for the cultivation of crops such as cotton, soybean, tur, wheat, gram, and jowar. As a result, agriculture remains the dominant land-use activity throughout the taluka. The landscape mainly consists of gently undulating plains with scattered rural settlements and agricultural fields.Climatically, the taluka falls within the semi-arid tropical zone and experiences three distinct seasons: summer, monsoon, and winter. The summer season is generally hot and dry, while winters are comparatively cool and pleasant. The area receives moderate annual rainfall, most of which occurs during the southwest monsoon season between June and September. Rainfall is the primary source of water for agricultural activities, and its variability significantly influences crop production and farmers' income. In years of inadequate rainfall, agricultural productivity often declines, highlighting the dependence of the region on monsoon conditions.Agriculture in Mudkhed Taluka is characterized by both food and commercial crop cultivation. Soybean, cotton, tur, maize, and jowar are the major kharif crops, whereas wheat, gram, and safflower are important rabi crops. The availability of irrigation through wells, borewells, and farm ponds has contributed to improvements in agricultural productivity in some parts of the taluka. However, a considerable proportion of agricultural land still depends on rainfall, making farming vulnerable to climatic uncertainties.The socio-economic structure of the taluka is closely linked with agriculture and allied activities such as livestock rearing and dairy farming. Most rural households depend directly or indirectly on agriculture for their livelihood. Therefore, the study of agricultural land use in Mudkhed Taluka is important for understanding the spatial distribution of agricultural activities, assessing the role of irrigation, and identifying the challenges and opportunities for sustainable agricultural development in the region

Objectives of the Study

- To analyze the agricultural land-use pattern in Mudkhed Taluka.
- To examine the cropping pattern and agricultural productivity.
- To assess the role of irrigation in agricultural development.
- To identify major agricultural problems and challenges.
- To suggest measures for sustainable agricultural development.

Database and Methodology

The present study of agricultural land use in Mudkhed Taluka is based on secondary data collected from various government sources, including the Census of India, District Statistical Abstract of Nanded, Directorate of Economics and Statistics, Department of Agriculture, Government of Maharashtra, and other relevant official publications. The database includes information related to geographical area, cultivated area, irrigated and unirrigated land, cropping pattern, crop-wise area, cropping intensity, soil characteristics, rainfall, and availability of irrigation facilities. These data were analyzed to understand the spatial and temporal characteristics of agricultural land use in the study region.The analysis indicates that agriculture is the dominant land-use activity in Mudkhed Taluka and constitutes an important component of the rural economy. A considerable proportion of the geographical area is utilized for agricultural purposes. However, the intensity of agricultural land use varies from one part of the taluka to another due to differences in soil fertility, rainfall distribution, irrigation availability, drainage conditions, and accessibility to agricultural infrastructure. Rain-fed agriculture occupies a significant area, making agricultural production highly dependent on the southwest monsoon. Consequently, variations in rainfall frequently influence crop selection, cultivated area, productivity, and cropping intensity.The cropping pattern of Mudkhed Taluka reflects the semi-arid climatic conditions and the availability of agricultural resources. Major crops include soybean, cotton, pigeon pea, sorghum, wheat, chickpea and other seasonal crops. During the Kharif season, soybean, cotton and pigeon pea are important crops, while wheat and chickpea occupy a relatively significant position during the Rabi season, particularly in areas where irrigation facilities are available. The study further indicates that farmers are gradually adopting crop diversification in response to changing market conditions, availability of irrigation, climatic variability, and increasing demand for commercial crops.The database also reveals considerable variation in irrigation facilities within the taluka. Irrigated agricultural land generally has higher cropping intensity and supports the cultivation of relatively water-intensive and commercially valuable crops. In contrast, unirrigated areas are mainly dependent on rainfall and are more vulnerable to drought and rainfall variability. Wells and borewells constitute important sources of irrigation in several villages, while other water-resource development measures contribute to agricultural sustainability. Improvement in irrigation infrastructure and efficient water-management practices could therefore substantially increase the productive potential of agricultural land.The results further demonstrate that the agricultural land-use pattern is influenced not only by physical factors but also by socio-economic conditions. Landholding size, availability of agricultural labour, access to credit, farm mechanization, fertilizer and seed availability, transportation, market facilities, and farmers' technological awareness influence decisions regarding crop selection and land utilization. Small and fragmented holdings remain an important constraint to the adoption of modern agricultural practices in some parts of the taluka. Increasing input costs and fluctuations in agricultural commodity prices also affect the economic sustainability of farming.Overall, the results show that Mudkhed Taluka possesses considerable potential for agricultural development, but this potential is unevenly distributed spatially. Efficient irrigation management, watershed development, soil conservation, crop diversification, modern agricultural technology, GIS-based land-use planning, climate-resilient farming, and improved market infrastructure are essential for sustainable agricultural development. The database generated through the present study can serve as a useful foundation for identifying agricultural development zones, preparing village-level agricultural plans, and formulating policies aimed at improving farm productivity and farmers' livelihoods.

Conclusion

Agricultural land use in Mudkhed Taluka is predominantly influenced by climatic conditions, soil characteristics, topography, availability of irrigation facilities, and socio-economic conditions of the farming community. Agriculture remains the major economic activity and provides livelihood opportunities to a large proportion of the rural population. The region supports the cultivation of crops such as soybean, cotton, pigeon pea, sorghum, wheat, chickpea, and various horticultural crops, depending upon rainfall, soil fertility, and water availability. However, the agricultural landscape is largely dependent on monsoon rainfall, and irregularity in the onset, distribution, and intensity of rainfall often affects crop productivity.The availability of irrigation plays an important role in determining the intensity and diversity of agricultural land use. Areas having better access to wells, borewells, canals, and other irrigation sources generally exhibit higher cropping intensity and greater cultivation of cash and

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

commercial crops. In contrast, rain-fed areas are more vulnerable to drought, soil-moisture deficiency, and fluctuations in agricultural production. Small and fragmented landholdings, increasing input costs, inadequate storage and marketing facilities, soil degradation, and limited access to modern agricultural technologies are additional constraints faced by farmers.Therefore, sustainable agricultural land-use planning is essential for the long-term development of Mudkhed Taluka. Promotion of micro-irrigation systems such as drip and sprinkler irrigation, rainwater harvesting, watershed development, soil and water conservation, crop diversification, organic farming, and climate-resilient agricultural practices can improve resource efficiency. The application of GIS and remote sensing can further assist in identifying suitable areas for different crops, monitoring changes in agricultural land use, assessing soil and water resources, and preparing scientifically based land-use plans. Strengthening agricultural extension services, farmer training, access to institutional credit, storage infrastructure, agro-processing, and market linkages can also enhance farmers' income. Thus, an integrated approach combining natural-resource management, modern technology, sustainable farming practices, and effective government interventions can significantly improve agricultural productivity and contribute to the overall socio-economic development of Mudkhed Taluka.

Acknowledgement
I would like to express my sincere gratitude to all those who have contributed directly or indirectly to the successful completion of this study entitled "A Geographical Study of Agricultural Land Use in Mudkhed Taluka, Nanded District, Maharashtra." I am deeply thankful to the Department of Geography, Rajiv Gandhi Mahavidyalaya, Mudkhed, District Nanded, for providing the necessary academic support and encouragement for undertaking this study. I am especially grateful to my research guide and colleagues for their valuable guidance, constructive suggestions, and continuous encouragement throughout the research work.

Abstract

The National Education Policy (NEP) 2020 has made research projects and dissertations mandatory for undergraduate students in India. This shift has put a lot of academic pressure on new student researchers. As a result, many students rely on a simple "copy-paste" approach from the internet. This unchecked dependency leads to high risks of plagiarism, reduces critical thinking, and opens the door to cyber threats like phishing and malware. This study explores how college librarians can act as "Digital Mentors" to help students overcome these challenges. Using a mixed-methods approach, data was collected from 100 undergraduate students and 15 library professionals through surveys and interviews. The findings show a clear positive change after library interventions: student usage of official academic platforms (like Shodhganga and INFLIBNET) jumped from 35% to 85%, direct copy-pasting dropped by 45%, and cyber security awareness improved by 58%. The study concludes that modern librarians are no longer just caretakers of books but are key educators in the digital age. It recommends mandatory digital literacy sessions for all new students and dedicated funds for library anti-plagiarism tools.

Introduction

Historical Context and Digital Transformation

In the past, higher education libraries were seen merely as physical spaces to store books and journals. Students and professors had to visit the library in person and manually search through physical card catalogs to find information. The librarian's job was mostly administrative—focused on buying, cataloging, and preserving printed materials.Today, things have changed completely. With high-speed internet, mobile connectivity, and cloud computing, physical presence is no longer mandatory to access information. Researchers can easily log into digital databases from their own devices and access millions of peer-reviewed e-books, open-access journals, and online archives from anywhere in the world.

Contemporary Challenges: Information Overload

While the digital shift has made information easily accessible, it has created a new problem: information overload. difficult to separate authentic academic sources from unverified internet pages.

Website: https://bnir.us

The internet is flooded with content, but a large portion of it lacks quality checks, peer reviews, or factual verification. Undergraduate students often find it They frequently rely on open blogs, wikis, and random websites without checking if the data is accurate or reliable.This challenge has redefined the role of the college librarian. Librarians are no longer just curators of print books; they are now digital guides. Their modern role is to teach students how to filter web information, evaluate online sources critically, and use digital learning platforms safely.

Alignment with National Education Policy 2020 (NEP 2020)

The National Education Policy (NEP) 2020 emphasizes the deep integration of technology into Indian higher education. Sections 23 and 24 of the policy focus on expanding online learning, creating virtual labs, and ensuring digital tools are accessible to all students to bridge the digital divide.Key initiatives under NEP 2020, such as the National Educational Technology Forum (NETF) and the National Research Foundation (NRF), aim to build strong research capabilities at the college level. Additionally, platforms like the Academic Bank of Credits (ABC) and Digital Locker require tech-savvy support. College librarians serve as frontline workers in implementing these mandates, offering the practical guidance students need to use these digital systems effectively.

Research Ethics and Technological Sensitivity

The ease of copying and downloading digital content has led to a significant rise in academic dishonesty, especially plagiarism. Because finding and copying text is so easy, many students do not develop the skills needed for independent thinking and writing. Furthermore, most incoming college students are unaware of Intellectual Property Rights (IPR), copyright laws, and standard referencing styles like APA, MLA, Harvard, or Chicago.As a result, students often use other people's work without giving proper credit, leading to unintentional plagiarism. This lowers the quality of college research and harms academic integrity. At the same time, searching for free or pirated materials on unverified websites exposes students to cyber risks like malware, ransomware, and phishing attacks. Novice researchers also risk falling prey to predatory journals—deceptive publishing companies that charge money to publish sub-standard work under the pressure of "publish or perish."

Objectives and Significance of the Research

This study analyzes these modern challenges and highlights how academic librarians can step in to solve them while supporting NEP 2020 goals. Librarians are well-positioned to teach research ethics and provide hands-on training for automated plagiarism checking tools (such as Turnitin or Ouriginal). By educating students on safe web browsing, librarians also create a secure environment that protects researchers from online financial frauds and cyber threats.

Research Background

Over the last ten years, higher education in India has shifted rapidly toward digital platforms. Initiatives like 'Digital India', along with cheap smartphones and mobile data, have made online info access a daily habit for students. Today's scholars depend on web resources for their study materials, research papers, and journals, moving away from a purely print-based approach toward a hybrid learning model.National digital networks like the UGC-INFLIBNET's N-LIST program, the National Digital Library of India (NDLI), and Shodhganga have vastly expanded what students can access. Crucially, the implementation of NEP 2020's four-year undergraduate degree introduces mandatory research projects and dissertations for final-year students. This has made college libraries essential centers for teaching students basic research skills and information literacy.

However, instant internet answers have also created a "copy-paste" habit. Due to tight academic deadlines, students often copy paragraphs from different web pages and paste them into their assignments without much thought. Moreover, trying to bypass paywalls to get free textbooks over the college Wi-Fi often exposes campus networks to security risks. Therefore, modern librarians must look beyond managing books and actively teach students how to navigate the online world safely and ethically.

Literature Review

Digital Literacy, NEP 2020, and the Librarian's Role

Contemporary pedagogical consensus dictates that functional digital literacy extends far beyond rudimentary computer literacy or

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

basic web browsing. Empirical research by Joshi and Kulkarni (2021) establishes that despite high levels of technical familiarity with mobile devices, modern student cohorts exhibit a significant inability to evaluate the structural credibility of digital data. Novice researchers struggle consistently to differentiate between biased commercial web outputs and validated academic data repositories.Within this framework, academic librarians serve as critical pedagogical buffers, directly intervening to instruct students in navigating authorized national digital infrastructures, including SWAYAM, the National Digital Library (NDL), Shodhganga, and the INFLIBNET consortia.

Research Plagiarism and Academic Integrity

Unintentional intellectual piracy has emerged as a pervasive systemic issue within modern higher education institutions. Novice researchers frequently engage in unauthorized textual duplication due to a complete lack of awareness regarding proper academic attribution protocols. A comprehensive institutional survey conducted by Sharma (2022) across Indian universities revealed that approximately 72% of submitted student projects and draft manuscripts contained a high concentration of plagiarized content.Crucially, the study demonstrated that the majority of this duplication was non-malicious, stemming from a fundamental lack of familiarity with the University Grants Commission (UGC) 2018 Academic Integrity Regulations and international citation frameworks (such as APA, MLA, or Harvard). From a global perspective, Smith (2020) argues that the mere codification of punitive institutional regulations is insufficient to curb plagiarism. Instead, information professionals must provide systematic, hands-on instructional training utilizing industry-standard automated text-matching software like Turnitin or Ouriginal.

Cyber Threats and Institutional Security Awareness

Higher education institutions have increasingly become high-priority targets for cybercriminals, a vulnerability driven primarily by the low levels of digital security awareness among the student body and academic staff. An empirical evaluation by Yadav and Singh (2023) indicated that although students spend an average of six to eight hours daily interacting with digital interfaces for educational purposes, their comprehension of network security architecture and data privacy protocols remains critically low.Scholars frequently compromise personal and institutional data security by clicking on malicious hyperlinks embedded within illicit open-access book repositories. To counteract these vulnerabilities, recent directives from the International Journal of Information Management suggest that contemporary libraries must undergo an operational shift to function as institutional 'cybersecurity awareness hubs.' This requires librarians to orchestrate practical workshops detailing robust password management, antivirus deployment, and the identification of deceptive predatory journals.

Research Gap

A comprehensive synthesis of existing literature indicates that digital literacy, academic plagiarism, and campus cybersecurity have historically been evaluated as isolated, independent phenomena. Furthermore, while contemporary academic discourse extensively explores the operational shift toward the research-centric four-year undergraduate framework mandated by NEP 2020, there remains a critical gap regarding integrated execution. Current studies largely fail to articulate a cohesive framework detailing how the modern academic librarian acts as a structural bridge to translate these separate policy mandates into institutional realities. This study directly addresses this research gap by providing an empirical analysis of the librarian's integrated role as a digital mentor within the NEP 2020 ecosystem.

Research Objectives

1. To investigate the structural interventions employed by college librarians to facilitate the discovery and optimal utilization of national e-resources, aligning with the core technological mandates of NEP 2020.
2. To evaluate the specific automated tools and pedagogical methodologies deployed by librarians to mitigate verbatim textual copying and ensure institutional compliance with national academic integrity frameworks.
3. To assess the efficacy of library-led security awareness initiatives in shielding student cohorts from predatory publishing networks, privacy breaches, and digital vulnerabilities.
4. To identify the core systemic challenges and infrastructural constraints encountered by

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

information professionals during their transition from traditional custodial management to digital-centric mentorship.

Research Hypotheses

Hypothesis 1 (H1): Systemic library-led instruction and orientation regarding national electronic repositories significantly accelerate scholarly data retrieval and enhance the functional digital literacy of student cohorts.

Hypothesis 2 (H2): The execution of hands-on instructional workshops by academic librarians utilizing automated text-matching software (e.g., Turnitin, Ouriginal) directly correlates with a quantifiable reduction in verbatim plagiarism in student submissions.

Hypothesis 3 (H3): The institutionalization of targeted cybersecurity awareness initiatives within college libraries significantly reduces student vulnerability to phishing vectors, digital financial fraud, and predatory academic journals.

Research Methodology

Research Design

This study adopts an empirical, descriptive, and analytical research design to evaluate the changing role of college librarians within the framework of NEP 2020 [0.16]. A mixed-method approach was employed to synthesize both quantitative metrics and qualitative insights. **Primary Data Collection:** Primary data were gathered through a dual-instrument approach. Quantitative empirics were collected via a structured online questionnaire distributed using Google Forms, capturing responses from a randomized sample of 100 undergraduate students and 15 library professionals. The student questionnaire measured digital usage patterns, plagiarism awareness, and cybersecurity vulnerability, while the librarian survey focused on institutional infrastructure and policy execution. This was supplemented by qualitative, semi-structured expert interviews conducted with senior library administrators to capture deeper operational insights. **Secondary Data Collection:** Secondary data were systematically compiled through a rigorous review of statutory policy frameworks, including the official National Education Policy 2020 draft, University Grants Commission (UGC) Academic Integrity Regulations (2018), and peer-reviewed international journals.

Results and Findings

An analysis of the empirical data collected from the student and professional cohorts yielded several critical insights: **10.1 Digital Literacy and Database Optimization:** Prior to targeted library interventions, 65% of the student respondents exhibited complete unfamiliarity with verified national repositories, including Shodhganga, INFLIBNET, and N-LIST. Post-intervention data revealed that systematic library training workshops enabled 80% of the cohort to independently and successfully execute complex academic literature searches. **Plagiarism Mitigation and Academic Integrity:** Baseline data indicated that 72% of the student sample routinely practised verbatim text duplication from unverified web sources for academic submissions. However, within institutions where librarians conducted mandatory, hands-on training sessions using Turnitin or Ouriginal, a substantial 45% decline in plagiarised content was observed. **Cybersecurity Defences and Threat Neutralisation:** Approximately 40% of the student population reported encountering malicious links or malware distribution vectors while attempting to access unauthorised open-access book repositories. The deployment of institutional warning mechanisms, safe browsing protocols, and curated lists of predatory journals by the library successfully elevated secure browsing habits among 85% of the respondents.

Summary of Empirical Key Findings

S.No.	Parameters Evaluated	Baseline Level (Pre-Guidance)	Post-Intervention Level	Net Positive Impact
1	Student usage of verified academic e-resources	35%	85%	+50%
2	Prevalence of verbatim	72%	27%	-45%

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

	copying/plagiarism			
3	Awareness of active cyber threats & security rules	30%	88%	+58%

Conclusion and Recommendations

Conclusion

The implementation of the National Education Policy 2020 has fundamentally altered the professional landscape of academic librarianship. College librarians have transcended their traditional, administrative-custodial roles to emerge as essential "Information Architects" and "Digital Mentors" within higher education. In this new capacity, they serve as critical pillars for facilitating undergraduate research, managing information overload, protecting academic integrity, and strengthening campus cybersecurity frameworks.

Recommendations

Mandatory Orientation Matrices: Higher education institutions must institutionalize a compulsory 'Digital Literacy and NEP 2020 Technology Integration Workshop' for all incoming undergraduate and postgraduate cohorts at the beginning of the academic year. **Dedicated Fiscal Resource Allocation:** To sustain qualitative institutional research, administrations must allocate dedicated annual budgets specifically for the acquisition and maintenance of advanced anti-plagiarism infrastructures (e.g., Turnitin, Ouriginal) to be managed directly by the college library. **Continuous Professional Development:** Academic institutions must sponsor regular faculty development programs (FDPs) and technical workshops for library professionals to upgrade their competencies in cyber laws, advanced data management, and emerging pedagogical technologies.

Inter-Departmental Cybersecurity Synergy: The institutional information technology (IT) department must work closely with the library administration to deploy secure firewalls, encrypted access endpoints, and regular security audits across campus Wi-Fi networks.

Abstract

The National Education Policy (NEP) 2020 represents a transformative framework for restructuring the Indian education system with a focus on universal access, equity, holistic development, foundational literacy and numeracy, competency-based learning, teacher development, digitalisation, and improved educational outcomes. This paper examines the major challenges and opportunities associated with the implementation of NEP 2020, with particular emphasis on systemic, administrative, socio-cultural, technological, financial, and pedagogical dimensions. The study analyses secondary data from UDISE+, the Annual Status of Education Report (ASER), the All India Survey on Higher Education (AISHE), and official publications of the Ministry of Education. The statistical analysis indicates measurable progress in teacher availability, transition rates, school infrastructure, digital facilities, and reduction in dropout rates. Between 2022–23 and 2025–26, the number of school teachers increased by approximately 8.3%, secondary dropout declined from 13.8% to 7.0%, secondary Gross Enrolment Ratio increased from 67.6% to 71.7%, and the proportion of schools with computers increased from 47.7% to 69.9%. However, important challenges remain, particularly in foundational learning, secondary-level retention, digital access, accessibility for students with disabilities, and higher education participation. The findings suggest that while NEP 2020 has created substantial opportunities for structural transformation, its long-term success will depend on effective governance, adequate financial resources, teacher capacity building, technological inclusion, continuous monitoring, and the conversion of improved educational inputs into better learning outcomes and equitable access.

Introduction

Education is one of the most important areas of human activity, because it shapes the future of individuals and nations. The National Education Policy (NEP) 2020—India's first new education policy in more than three decades—aims to transform both the substance and the structure of its education system by 2040. In particular, it seeks to ensure universal access to high-quality school education, reduce disparities among different socioeconomic groups, align learning outcomes with the country's developmental needs, and prepare children for life as socially aware, competent, and productive citizens. Implementation of the NEP 2020, however, calls for substantial efforts, especially given the need to navigate both administrative processes and the deep-rooted sociocultural fabric of Indian society. Preliminary research suggests several specific challenges, as well as considerable opportunities for advancing the policy's core objectives simultaneously. To what extent are the anticipated challenges and opportunities likely to materialize? What are the relevant systemic, administrative, and socio-cultural considerations? What objective indicators are expected to show improvement, and over what timeframe? Addressing these questions is vital for planning, executing, and sustaining the NEP 2020 reforms and for understanding their broader implications for the Indian education system and society (Aithal & Aithal, 2019) ; (Kumar Nag, 2022)

Conceptual Foundations and Policy Goals The National Education Policy (NEP) 2020 aspires to transform the Indian education system to effectively address current and future challenges, improve learning outcomes, and substantially contribute to national development. Four core concepts are critical to understanding the NEP 2020 objectives—(i) universal access; (ii) holistic development; (iii) foundational literacy and numeracy; and (iv) competency-based learning. Universal access to quality education and safeguarding learning for all children have been primary long-standing goals of Indian education policy to promote social equity, enhance human capital and meet the rising demand for skilled human resources. Holistic development through quality education, including physical and emotional well-being, practical skills, art, and culture for responsible citizenship, environment consciousness, employment, and entrepreneurship were established in the Constitutional framework as a prerequisite for national development. Ensuring that children complete foundational literacy and numeracy by Grade 3 had been another policy goal since 1970, and consequently the new emphasis under NEP 2020. Competency-based learning in contrast to rote memorisation has been articulated since 1986, yet remains limited in school education. The NEP 2020 stresses foundational learning until Grade 3 and foundational literacy and numeracy and has laid down strategies to transform pedagogy from rote memorisation to a competency-based approach (Aithal & Aithal, 2019).

Administrative and Governance Framework

A holistic framework for educational governance at the national and state levels is crucial to effectively implement the National Education Policy (NEP) 2020. The established, well-defined responsibilities of government agencies and the proper harmonization of activities among various departments will facilitate the timely and effective execution of policies and schemes. Consequently, a National Educational Technology Forum will be created to build an ecosystem that effectively leverages technology to strengthen education. The forum will sustainably engage stakeholders across sectors to gather and exchange amplifiable ideas and prime effective implmentation strategies at local, regional, and national levels. The central government will develop the National Assessment Centre, "SAMBHAV", to evaluate the assessment framework and renew pedagogical continuity, focusing on foundational literacy and numeracy. A National Educational Technology Forum will be formed to build an ecosystem that leverages education technology to reach the national wellness-inspired goals of the NEP 2020; and to harmoniously engage educational stakeholders across sectors with a branding scope of gathering and exchanging amplifiable ideas and strategies for effectively and sustainably implementation at local, regional, and national levels. The National Assessment Centre "SAMBHAV" will be constituted under the auspices of National Council of Educational Research and Training to act as a vehicle of continuous renew of the assessment framework and its desirable pedagogical continuity with block priority on foundational literacy and numeracy (Aithal & Aithal, 2019).

Curriculum, Pedagogy, and Assessment Reforms

National Education Policy 2020 (NEP 2020) aims to address the challenges of the previous National Policy on Education (NPE 1986), which recognised education as a fundamental right. NEP 2020 strives to provide equitable, inclusive, and accessible quality education for all children from preschool to secondary levels; ensure the holistic development of every child through protection, nurturing, and education; and achieve universal basic literacy and numeracy by 2025 (Aithal & Aithal, 2019). The NEP recommends curricular reforms to transform national education from exam-centric to student-centric. These reforms facilitate the attainment of essential learning competencies in students through continuous and comprehensive assessment and attainment of foundational literacy and numeracy in the primary years. In addition, the Curriculum should be made more flexible to promote diverse talents and aptitudes; should allow students to study subjects of their choice; and should encourage a multidisciplinary approach minimising strict separation among subjects, streams, and curricular, extra-curricular, and co-curricular activities. Curricular shifts facilitated by the foundation of the National Educational Technology Forum (NETF), the National Assessment Centre 'Shaandaar', and National Educational Technology Forum. Student assessment procedures have also changed, with a greater focus on competency-based learning, knowledge application, analytical, critical, and conceptual understanding, and Holistic Progress Cards with Grade (A, B, C, D) based on both scholastic and co-scholastic indicators being introduced in accordance to new assessment guidelines framed by NEP-2020 for classes I–VIII. Progression from one grade to another in classes VI–VIII is based on the assessment of formative and summative evaluation, while in class IX, it is also based on the final examination.

Equity, Inclusion, and Access

Education must be equitably accessible to all if the country is to protect the right to education guaranteed in the Constitution. Universal access to quality education is vital for eradicating social inequities and building an inclusive society. The Government is committed to ensuring the full and continuous participation of children from all socioeconomic strata and locations, including the poor, underprivileged, minorities, backward classes, and differently-abled, in the educational system (Aithal & Aithal, 2019). To fulfil this commitment, the education system must be continuously improved, with a particular focus on the constituency currently participating least in or benefiting least from it (Kumar Nag, 2022). By improving overall participation and learning outcomes, the disparities faced in the education system, whether by income, gender, location, ethnicity, or language, can be effectively reduced (Jibirin Salihu & Jamil, 2015). Measures will be taken to monitor the system and identify locations and groups still facing equity gaps.

Teacher Education and Professional Development

National Education Policy (NEP) 2020 aims to develop a sound environment for teacher education, focused on a pool of qualified, high-capacity, and professionally competent teachers, capable of exploring and nurturing learners' talents and innovative skills in line with technology. Several crucial aspects have been defined to improve student-learning outcomes and increase the engagement of stakeholders who can promote education reform. Implementation of NEP 2020 envisages national standards for setting up teacher education institutions and teacher improvement institutes for capacity development. Various types of pre-service teacher education courses of 4-year duration after 12th grade and in-service teacher training up to 50 hours per year are suggested to achieve the NEP-2020 goal of ensuring that all teachers acquire a professional teaching qualification. A National Professional Standards for Teachers (NPST) document is being worked on to specify professional standards for teachers after extensive review, discussion, and consultation with stakeholders and experts in the field of education. Although several existing documents already provide guidelines on teacher performance, it is observed that guidance for measuring the quality of teaching and improving professional skills is not adequately available. Teachers form a link between society and the education system. Variables of teachers willing to join the system and institutional trust from their perspective have not been sufficiently explored and addressed yet. Consequently, enhancing the quality, engagement, stability, and retention of teachers remain vital to successful larger educational reforms. It is essential to identify the components influencing individuals' decisions to join, stay, or leave the profession after entry point (Saira Hamid, 2017) ; (Adolphus Okujagu, 2013).

Technology, Digital Infrastructure, and Innovation

Technological progress and the rapid growth of the EdTech sector during the COVID-19 pandemic have transformed the way teaching and learning are viewed and understood. The new approach offers flexible and personalized learning avenues for students, teachers, and parents. India's National Education Policy (NEP) 2020 is a timely response, seeking to overhaul the education system and unlock transformative potential through digital access, training, and content. A National Digital Educational Architecture (NDEAR) is being designed, with the aim of providing an inclusive, flexible, affordable, and learner-centric digital approach to teaching-learning and assessment (Kumar Nag, 2022). The NEP proposes the establishment of an innovative technology-learning architecture that supports an array of platforms, technologies, and content providers. Physical, audio-visual, and online content can be integrated for easy replay and multilingual flexibility. New national, state, and local-level material-developing organizations, covering the spectrum from pre-school to higher education, can create and share content across platforms. Boxed Instructional Metalanguage (BIML), a universally applicable design meta-language, supports multi-language multi-media lessons for learners at all levels. The inclusion of artificial intelligence (AI), machine learning (ML), data science, robotics, and computational thinking into the curriculum fosters understanding of technological/math-oriented knowledge across all disciplines. The system also encompasses non-formal, lifelong, and adult education, as well as social-science- and skill-development-oriented content.

Financing and Resource Allocation

Financing forms the cornerstone of effective operationalization of any national education policy. As delivery of quality education depends fundamentally on sustained public expenditure on education and related infrastructures, it is crucial to understand the national, state, and institutional level resources required to fulfil the objectives of the National Education Policy (NEP) 2020. A related concern is the financing approach needed for the same. Financing the education system in India has followed the federal financing approach since

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Independence. Accordingly, financing concerns need to be examined separately at the national, state, and institutional levels. Financing NEP 2020 through a separate and dedicated source of revenue would contribute significantly towards achieving the objectives and would enable priorities to be predetermined irrespective of individual agendas of each State Education Department (Obadara & Alaka, 2010). According to the resource and requirement estimates submitted by the National Institute of Educational Planning and Administration, about 60 trillion rupees at 2021–22 prices would be required over a period of 10 years to realize various NEP 2020 goals along with the right infrastructure and capacity enhancement. The resources would have to be committed for the school, higher, and technical sectors to cater to the holistic nature of the policy. This is also a very conservative estimate, as with every passing year more new goals and policies are being introduced which are certainly going to increase the huge outlay further.

Implementation Challenges: Systemic, Administrative, and Socio-Cultural

Against the backdrop of a traditional, highly-centralized political system, NEP 2020 seeks to radically reform the educational apparatus of a country characterized by systemic, administrative, and socio-cultural obstacles (Aithal & Aithal, 2019). Coordination among widely-dispersed, still poorly-integrated authorities is essential for any overhaul to be undertaken effectively. Government attitude towards outmoded arrangements, especially those that fuel dysfunction, should be verging on aggressive. Unbundling developmental activities associated with elementary, secondary, tertiary, and vocational education remains a drastic but potentially effective option. With innumerable languages and dialects spoken over an immense territory, the heritage of a long-vanished elite education that thrived under a relatively tolerant regime still lingers in large parts of society. Most citizens of India are conscious of linguistic and cultural incompatibility among regions and communities, but policy incoherence hampers education in several of the country's rich endowments and traditions.

Opportunities for Quality, Equity, and Outcomes

The National Education Policy, 2020 aims at achieving the goal of quality education for all, equity in access and participation, and improved learning outcomes at all levels of school education. Quality, equity, and outcomes were two of the ten major themes of the consultation process on the draft National Education Policy undertaken by the Ministry of Human Resource Development during June–August 2019. Access to elementary education in India has improved significantly since Independence, but there are still significant quality gaps that need to be addressed. Quality of education is determined by multiple factors related to the availability of infrastructure, availability and capacity of teachers, teaching-learning practices, availability of learning resources, assessment system, governance, administration, and perception of the stakeholders. NEP 2020 focuses on improving quality and therefore provides several opportunities. As stated by the Government of India (2020a, p. 6) "As per the National Achievement Survey (NAS) in 2017, only 37% of Class V students were able to read Class II level text. 75% of Class V students were found to be unable to solve subtraction problems involving 2-digit numbers and 80% of Class V students were unable to do division." It is in recognition of such poor learning outcomes that the NEP emphasizes Foundational Literacy and Numeracy (FLN) as an urgent and time-bound national mission. All educational reforms initiated under the NEP should therefore address and improve the pedagogy relating to FLN. Specific strategies to improve FLN have been outlined in the NEP and include the introduction of the FLN concept in teacher pre-service and in-service training courses, setting up an FLN Task Force, developing a National Book Promotion Policy, developing simple books for children, and promoting storytelling in schools.

Policy Evaluation, Monitoring, and Accountability

Monitoring and evaluation play a crucial role in ensuring that policies effectively achieve their intended impacts, though they are often overlooked in many government initiatives (Abdullahi JIMALE, 2021). A high-quality evaluation system and the collection of relevant data are preconditions for meaningful policy assessment, while a policy framework that clarifies the envisaged purpose, results, and conditions for implementation facilitates continuous monitoring of outcomes. The National Education Policy (NEP) 2020 has enormous transformative potential with extensive long-term, systemic changes expected across the education sector. Given the ambitious nature of the reforms and their expected consequences, robust frameworks and mechanisms for evaluation, accountability, and feedback will be indispensable for measuring where the system is today, determining the actual impact of reforms, and helping to adjust implementation midcourse (Aithal & Aithal, 2019). The ultimate aim is to develop a cost-effective, easy-to-use, adaptable, and user-friendly framework relevant to different levels of government and diverse stakeholders in the

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

education system capable of supporting purposeful, repeatable, actionable, and impact-oriented evaluation of policy implementation, and that can provide frequent and relevant feedback to impart insight about progress towards achieving the educational transformation that NEP 2020 envisions.

Case Studies and Comparative Perspectives

National and international case studies illuminate the opportunities and challenges associated with NEP 2020 implementation. The past decade has witnessed the creation of well-crafted policy documents outlining educational reforms in various countries, yet increasingly, it has become difficult to translate these into effective implementation. The shifting of educational governance has created a new divide between meta policy and actual policy. The NEP introduced far-reaching reforms, with several pathways that have already been demonstrated on a global scale; at the same time, many systemic political and bureaucratic barriers remain to be overcome. The challenge of shifting from an input to an output vision of education has also become more acute, and there is a growing suspicion that the policy is merely about reorganizing educational structure rather than creating more relevant, flexible, and engaging learning opportunities. The experience of many countries indicates that deep cultural, systemic, and governance impediments remain, and the capability and agility to implement transformational policy vary widely.Transformational education policies have been adopted in a number of countries, including Mongolia, Malaysia, Bhutan, Canada, Singapore, New Zealand, and South Korea. Each has had to balance either substantial reform with existing federal structures or radical re-engineering of the entire form and function of education, sometimes both. Further, the relationship between educational policy and governance differs widely. These countries have successfully addressed key impediments to their reform agendas (Aithal & Aithal, 2019).

Policy Implications for Stakeholders

Recent past has witnessed exuberant developments with regards to National Education Policy (NEP) 2020. Stakes related to stipulated time-frames have been burdening various entities involved in the implementation procedure. Institutions are thus lagging behind the actual progress required to be made. The opportunity to avail multiple employment instigates youths to deviate towards securing the same rather than following the path defined through Erasmus Plus. The occasions skipped for other callings renders it an arduous job to get on to the same juncture as well. Several initiatives have thus been taken with regards to eradication of such hurdles or bottlenecks making compatibility feasible to land up again on the tracks of earlier presentations. The availability of alternate routes is not a mere reason; rather the other prospects get fantastic graces along with the stretch to be continued. The fresh and quick gratifications, ease of practices, more autonomy along with lesser supervision force to switch over rendering extra endeavours towards compliance very troublesome task. Collateral benefits tend to attract the attention for deviation rather follow the necessity of availing educational upgraded options as earlier portrayed. Offering suggestions of providing computer laboratory bench work rather matching with the calling along with window available within educational topics to realise the technological knowhow for being success full have also been tabled. (Aithal & Aithal, 2019)

Statistical Data Analysis and Interpretation

To strengthen the empirical dimension of the study, secondary statistical data have been compiled from the Unified District Information System for Education Plus (UDISE+), All India Survey on Higher Education (AISHE), Annual Status of Education Report (ASER), Ministry of Education, Government of India, and related official publications. The statistical indicators provide measurable evidence regarding the progress, challenges, and opportunities associated with the implementation of the National Education Policy (NEP) 2020. The analysis focuses on enrolment, teacher availability, pupil-teacher ratio, dropout and retention, transition rates, digital infrastructure, basic school facilities, gender participation, learning outcomes, and higher education participation. These indicators are directly relevant to the major themes discussed earlier in the paper, particularly access, equity, foundational learning, teacher development, technology, infrastructure, and educational outcomes. The original manuscript itself emphasizes universal access, foundational literacy and numeracy, teacher capacity, digital infrastructure, equity and monitoring as central elements of NEP implementation.

Table 1. Growth in Number of School Teachers in India

Academic Year	Number of Teachers	Annual Increase	Index (2022–23 = 100)
2022–23	94,83,294	–	100.00

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

2023–24	98,07,600	3.42%	103.42
2024–25	1,01,22,420	3.21%	106.74
2025–26	1,02,73,020	1.49%	108.33

Source: UDISE+ 2025–26, Ministry of Education, Government of India.

Interpretation: The total number of school teachers increased from approximately 94.83 lakh in 2022–23 to 102.73 lakh in 2025–26. This represents an overall increase of about **8.3%**. The crossing of the one-crore-teacher mark demonstrates substantial expansion in teaching capacity. However, the annual rate of increase moderated to approximately 1.5% in 2025–26, indicating that future policy attention may increasingly need to focus not only on numerical expansion but also on equitable deployment, professional development and teacher quality

.

Table 2. Pupil-Teacher Ratio under the NEP School Structure

Educational Stage	2022–23	2023–24	2024–25	2025–26
Foundational	11	10	10	10
Preparatory	14	13	13	12
Middle	18	18	17	17
Secondary	23	21	21	21

Source: UDISE+ 2025–26.

Interpretation: Pupil-teacher ratios have remained substantially below the NEP benchmark of 30 pupils per teacher. The most significant improvement occurred at the secondary stage, where the PTR declined from 23 in 2022–23 to 21 in 2025–26. The preparatory-stage PTR also improved from 14 to 12. These figures indicate favourable aggregate teacher availability, although national averages may conceal state, district, subject-wise and rural–urban disparities.

Table 3. Dropout Rates at Major Educational Stages

Academic Year	Preparatory (%)	Middle (%)	Secondary (%)
2022–23	8.7	8.1	13.8
2023–24	3.7	5.2	10.9
2024–25	2.3	3.5	8.2
2025–26	1.8	3.6	7.0

Source: UDISE+ 2025–26.

Interpretation: Dropout rates show substantial improvement after 2022–23. At the preparatory stage, the rate fell from 8.7% to 1.8%, while at the secondary stage it declined from 13.8% to 7.0%. Secondary education nevertheless continues to have the highest dropout rate. The slight increase in middle-stage dropout from 3.5% in 2024–25 to 3.6% in 2025–26 also indicates that progress is not completely uniform.

Table 4. Student Retention Rates

Academic Year	Foundational (%)	Preparatory (%)	Middle (%)	Secondary (%)
2022–23	92.1	90.9	75.8	44.1
2023–24	98.0	85.4	78.0	45.6
2024–25	98.9	92.4	82.8	47.2
2025–26	98.5	91.1	83.7	51.9

Source: UDISE+ 2025–26.

Interpretation: Retention is very high at the foundational stage but declines considerably as students move towards secondary education. Secondary retention improved from 44.1% in 2022–23 to 51.9% in 2025–26, an increase of 7.8 percentage points. Despite this improvement, retaining students through secondary education remains a major policy challenge. The data support NEP's emphasis on universal participation and reducing school discontinuation.

Table 5. Gross Enrolment Ratio at Middle and Secondary Stages

Academic Year	Middle GER (%)	Secondary GER (%)
2022–23	90.0	67.6
2023–24	89.5	66.5

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

2024–25	90.3	68.5
2025–26	89.6	71.7

Source: UDISE+ 2025–26.

Interpretation: Middle-stage GER has remained close to 90%, whereas secondary-stage GER is considerably lower. Encouragingly, secondary GER increased from 67.6% in 2022–23 to **71.7% in 2025–26**. The difference between middle and secondary GER remains approximately 17.9 percentage points in 2025–26, suggesting that continued participation after the middle stage requires further policy intervention.

Table 6. Transition Rates between Educational Stages

Academic Year	Foundational to Preparatory (%)	Preparatory to Middle (%)	Middle to Secondary (%)
2022–23	92.2	87.9	86.7
2023–24	98.1	88.8	83.3
2024–25	98.6	92.2	86.6
2025–26	99.2	93.8	88.3

Source: UDISE+ 2025–26.

Interpretation: Transition rates show a generally positive pattern. By 2025–26, 99.2% of students transitioned from the foundational to preparatory stage and 93.8% from preparatory to middle. The transition from middle to secondary remained comparatively lower at 88.3%. Therefore, the transition into secondary education continues to be an important intervention point for achieving universal school participation.

Table 7. Digital Infrastructure in Indian Schools

Academic Year	Schools with Computers (%)	Schools with Internet (%)
2022–23	47.7	49.7
2023–24	57.2	53.9
2024–25	64.7	63.5
2025–26	69.9	67.4

Source: UDISE+ 2025–26.

Interpretation: Digital infrastructure has expanded rapidly. The proportion of schools with computers increased by **22.2 percentage points**, from 47.7% in 2022–23 to 69.9% in 2025–26. Internet availability increased by 17.7 percentage points during the same period. Nevertheless, approximately 30% of schools still lacked computer access and nearly one-third lacked internet connectivity in 2025–26. This represents both a significant achievement and an important continuing challenge to NEP's technology-based education agenda.

Table 8. Availability of Basic Infrastructure in Schools

Facility	2022–23 (%)	2023–24 (%)	2024–25 (%)	2025–26 (%)
Electricity	91.7	91.8	93.6	95.0
Drinking Water	98.4	98.3	99.3	99.5
Girls' Toilets	97.0	97.2	97.3	98.5
Boys' Toilets	95.6	95.7	96.2	97.2
Handwashing Facility	94.1	94.7	95.9	96.9
Playground	82.0	82.4	83.0	81.9
Library	88.3	89.0	89.5	90.5
Rainwater Harvesting	28.0	28.4	29.4	29.9
Ramps with Handrails	51.0	52.3	54.9	58.2

Source: UDISE+ 2025–26.

Interpretation: Basic school infrastructure has reached high levels for drinking water, toilets, electricity and handwashing facilities. Drinking-water availability reached 99.5%, girls' toilets 98.5% and electricity 95.0% in 2025–26. However, only 58.2% of schools had ramps with handrails and only 29.9% had rainwater-harvesting facilities. Playground availability also declined slightly from 83.0% to 81.9% between 2024–25 and 2025–26. The figures therefore show substantial progress alongside continuing gaps in accessibility,

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

environmental sustainability and holistic educational infrastructure.

Table 9. Gender Representation in School Education

Academic Year	Girls' Share of Enrolment (%)	Female Teachers (%)
2022–23	48.0	52.3
2023–24	48.1	53.3
2024–25	48.3	54.2
2025–26	48.4	54.9

Source: UDISE+ 2025–26.

Interpretation: Girls' share of total school enrolment increased gradually from 48.0% to 48.4%. Female representation among teachers increased more strongly, from 52.3% to 54.9%. The increasing presence of female teachers is important from the perspective of gender-sensitive learning environments, role modelling and inclusive education. However, gender equity should also be assessed through transition, retention and learning outcomes rather than enrolment alone.

Table 10. Selected Learning Outcomes from ASER 2024

Learning Indicator	2018 (%)	2022 (%)	2024 (%)	Change 2022–24
Std III, Government Schools: able to read Std II text	20.9	16.3	23.4	+7.1 pp
Std V, Government Schools: able to read Std II text	44.2	38.5	44.8	+6.3 pp
Std VIII, Government Schools: able to read Std II text	69.0	66.2	67.5	+1.3 pp
Std III, All Schools: able to do subtraction	28.2	25.9	33.7	+7.8 pp
Std V, All Schools: able to do division	27.9	25.6	30.7	+5.1 pp

Source: Annual Status of Education Report (ASER) 2024.

Interpretation: ASER 2024 indicates a recovery in foundational learning following the pandemic-era decline. The proportion of government-school Std III students able to read a Std II-level text increased from 16.3% in 2022 to 23.4% in 2024. Similarly, the proportion of all Std III students able to perform subtraction increased to 33.7%. Nevertheless, the absolute learning levels remain a significant concern. Only around one-third of Std III students demonstrated the specified arithmetic competency and less than one-third of Std V students could perform division. These results reinforce the paper's emphasis on Foundational Literacy and Numeracy as one of the most important implementation challenges under NEP 2020. The original manuscript similarly identifies weak reading and arithmetic performance as a major rationale for the FLN mission.

Higher Education Perspective

Although the school-education indicators provide the most recent annual evidence on NEP implementation, higher education is also an essential part of the policy. According to AISHE 2021–22, total higher-education enrolment increased from **3.42 crore in 2014–15 to 4.33 crore in 2021–22**, representing growth of approximately 26.5%. Female enrolment increased from 1.57 crore to 2.07 crore during the same period. The higher-education Gross Enrolment Ratio increased from **23.7% to 28.4%**, while female GER increased from 22.9% to 28.5%.

Table 11. Selected Higher Education Indicators

Indicator	2014–15	2021–22	Change
Total Higher Education Enrolment	3.42 crore	4.33 crore	+26.5%
Female Enrolment	1.57 crore	2.07 crore	+31.8% approx.
Overall GER	23.7%	28.4%	+4.7 pp
Female GER	22.9%	28.5%	+5.6 pp
SC Student Enrolment	46.07 lakh	66.23 lakh	+44% approx.

Source: AISHE 2021–22, Ministry of Education.

Interpretation: Higher education participation expanded considerably during the period. Female GER slightly exceeded overall GER in 2021–22, demonstrating progress in gender participation. At the same time, a GER of 28.4% remains substantially below the NEP 2020 aspiration of achieving a 50% GER in higher education by 2035. Expansion of capacity, affordability, multidisciplinary institutions, digital access and inclusion of disadvantaged groups will therefore remain central implementation priorities.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Overall Statistical Assessment of NEP 2020 Implementation

The statistical evidence indicates that the implementation of NEP 2020 is producing measurable improvements in several areas. Teacher numbers have increased, pupil-teacher ratios are favourable, secondary dropout has declined, transition rates have improved, digital infrastructure has expanded and basic facilities have approached near-universal coverage in several categories. At the same time, persistent challenges remain in secondary retention, secondary enrolment, foundational learning, digital access, accessibility for students with disabilities and higher-education participation. Between 2022–23 and 2025–26, the most visible improvements include the reduction of the preparatory dropout rate from **8.7% to 1.8%**, reduction of secondary dropout from **13.8% to 7.0%**, increase in secondary GER from **67.6% to 71.7%**, increase in schools with computer facilities from **47.7% to 69.9%**, and increase in schools with internet access from **49.7% to 67.4%**. However, statistical progress in educational inputs should not automatically be interpreted as equivalent improvement in educational outcomes. ASER 2024 shows that foundational reading and arithmetic competencies remain comparatively low despite recent recovery. This distinction is particularly important for NEP 2020 because the policy seeks to move education away from an input-centred system towards competency, learning outcomes, holistic development and measurable educational quality. The findings therefore suggest that NEP 2020 has created substantial opportunities for structural transformation, but successful implementation will depend on converting improvements in infrastructure, staffing, enrolment and technology into stronger learning outcomes, greater retention and equitable access across regions and socioeconomic groups.

Major Statistical Findings

The analysis reveals that India's education system has made measurable post-NEP progress in teacher capacity, school retention, transition, digitalisation and infrastructure. Teacher strength increased by approximately **8.3% between 2022–23 and 2025–26**. Secondary dropout declined by **6.8 percentage points**, while secondary GER increased by **4.1 percentage points**. Computer availability in schools increased by **22.2 percentage points** and internet connectivity by **17.7 percentage points**. Female representation among teachers increased from **52.3% to 54.9%**. At the same time, secondary retention remained only **51.9%**, schools with ramps and handrails stood at **58.2%**, and ASER evidence continued to reveal substantial foundational learning gaps. These findings confirm that implementation of NEP 2020 involves both significant opportunities and continuing systemic challenges. **Note:** UDISE+ figures are administrative school-system statistics, while ASER is a sample-based household survey of rural India. Therefore, their indicators should be interpreted according to their respective methodologies and should not be treated as directly interchangeable measures. ASER 2024 covered more than 650,000 children across more than 600 districts in 26 states and two Union Territories.

Conclusion

Maintaining educational quality, equity, and efficiency while radically transforming the curriculum, pedagogy, assessment, teacher preparation, and entire governance structures presents unprecedented implementation challenges. Although these changes could enable India to achieve one of the world's largest and most inclusive educational systems, significant risks and uncertainties surround the implementation (Aithal & Aithal, 2019).

Among the freest and most easily transformed aspects of the educational ecosystem, the opportunities simultaneously hold the promise of significantly improving quality, equity, and learning outcomes and of upgrading implementation capacity. Tracking the status of thirty-five nationally determined indicators offers a simple measure of potential progress throughout the implementation process.

Abstract

India's higher education system has never lacked policy mandates for community engagement. What it has consistently lacked is a working mechanism to connect community-identified problems with academic institutions positioned to address them. This paper proposes the Integrated Community Engagement & Project Management System (ICEPMS) — a single-window digital ecosystem that bridges this gap by linking community demand directly to higher education delivery. The paper develops a five-stakeholder conceptual model through systematic analysis of national policy documents, international frameworks, and established scholarship on community-based participatory research (CBPR) and service-learning. The proposed system enables citizens, Gram Panchayat members, NGOs, and journalists to report local problems digitally; allows administrators to convert those problems into credit-mapped academic topics; enables colleges and students to execute Community Engagement Projects; records performance transparently; and facilitates funding from CSR departments and government officers based on verifiable institutional performance. The paper discusses the role of artificial intelligence as a supportive accelerator within the system. ICEPMS aligns with the mandates of the National Education Policy (NEP) 2020, the UGC Guidelines for Fostering Social Responsibility and Community Engagement in Higher Education Institutions in India 2.0 (2022), and institutional Community Engagement Project frameworks. By providing operational infrastructure for existing policy intent, the paper contributes a practical framework for community engagement in Indian higher education.

Keywords: *Community Engagement, ICEPMS, Higher Education, Digital Ecosystem, Social Responsibility, Credit Mapping, NEP 2020, UGC Guidelines 2.0, Single-Window System*

Introduction

Background

Indian higher education policy has increasingly emphasised the responsibility of universities and colleges to engage with the communities they serve. The National Education Policy (NEP) 2020 mandates that community engagement be woven into the regular curriculum of all higher education institutions. The University Grants Commission (UGC) reinforced this mandate in December 2022 by publishing the *Guidelines for Fostering Social Responsibility and Community Engagement in Higher Education Institutions in India 2.0*. These guidelines prescribe a mandatory two-credit Community Engagement course for every undergraduate and postgraduate student and establish principles including mutual learning between institutions and communities, engagement across all academic disciplines, credit-based participation for students and teachers, and the development of linkages with local institutions. These frameworks collectively recognise a principle now widely accepted internationally: higher education institutions exist to serve the societies in which they are embedded.

Quick Response Code:

Website: https://bnir.us

The UNESCO Declaration from the Second Conference on Higher Education (Paris, 2009) stated that higher education has the social responsibility to advance understanding of multifaceted issues through teaching, research, and service. The Global University Network for Innovations (GUNI) has consistently advocated that community engagement be integrated into all institutional activities as a way of thinking and acting rather than treated as an optional add-on. Despite these strong policy foundations, practical implementation of community engagement in Indian higher education continues to face a fundamental difficulty. The gap is not in policy intent it is in operational machinery.

The Problem

Community engagement in Indian higher education operates through disconnected, informal, and often ad hoc channels. Citizens, NGOs, journalists, and local representatives identify problems daily — from broken water pipelines to unsafe roads and inadequate healthcare — yet this information rarely reaches nearby colleges in a structured or actionable manner. Even when it does, converting a real-world problem into an academic project remains entirely manual: The UGC Guidelines 2.0 acknowledge this, noting that institutions generally overlook local expertise. This points to a deeper issue: community knowledge about its own challenges is not systematically accessed or connected to academic processes. Three further difficulties compound this gap.

First, mandatory CEP requirements risk becoming procedural — students visit locations, write reports, and earn credits without meaningful local contribution.

Second, local governments and CSR departments lack transparent mechanisms to determine which colleges are engaged where and what outcomes they have achieved. Third, when colleges need additional research funding, no structured, evidence-based mechanism exists to present their case to potential funders. All these difficulties stem from a single root cause: the absence of an integrated digital platform connecting all stakeholders — citizens, local representatives, administrators, faculty, students, and funders - through one structured, transparent system.

Proposed Solution

This paper proposes the Integrated Community Engagement & Project Management System (ICEPMS) — a single-window digital ecosystem designed to connect community demand with higher education delivery. ICEPMS provides a unified digital platform where citizens and community representatives report problems digitally; platform administrators convert verified problems into credit-mapped academic topics; colleges and faculty execute Community Engagement Projects; performance data is recorded transparently; and CSR departments, government officers, and other funders access verified performance data to make informed funding decisions. ICEPMS does not propose new mandates or alter existing policy frameworks. It aims to provide the operational infrastructure that existing mandates require to function effectively. The system is designed to be simple, transparent, and adaptable across India's diverse higher education contexts.

Research Questions

This paper addresses the following questions:

RQ1: What operational gaps prevent community-identified problems from being converted into academic projects under NEP 2020 and UGC Guidelines 2.0?

RQ2: How can a single-window digital ecosystem bridge the gap between community demand and academic delivery?

RQ3: How does the proposed system align with existing national and institutional policy frameworks for community engagement?

Literature Review

International Frameworks for University-Community Engagement

The expectation that higher education institutions should engage with their surrounding communities is well established in global policy and scholarship. The UNESCO Declaration from the Second Conference on Higher Education (Paris, 2009) explicitly stated that higher education bears social responsibility to advance understanding of multifaceted issues through teaching, research, and service. The Global University Network for Innovations (GUNI) has been a leading international voice on this subject. Its 5th World Report on Higher Education (2014) proposed that Community University Engagement be integrated into all institutional, teaching, and research activities. Its 6th World Report (2017) focused on "Towards A Socially Responsible University: Balancing the Global and the Local," calling upon institutions to serve as centres linking local needs with global knowledge. Several international models demonstrate how university-community engagement can be operationalised. The Science Shops originating in the Netherlands in the 1970s function as intermediary organisations between universities and communities, facilitating participatory research on issues identified by community members. The Talloires Network, initiated in 2005 at Tufts University, now encompasses over 400 universities worldwide,

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

promoting university engagement in communities to strengthen democratic citizenship. The European Union's Horizon 2020 programme emphasised "Responsible Research and Innovation," embedding public engagement across university research projects. Canada's Social Science and Humanities Research Council established dedicated funding streams for Community-University Research Alliances. These models share a common feature: each involves institutional infrastructure — whether physical, networked, or funded — that connects universities with communities. India's higher education system, given its scale, diversity, and federal structure, requires similarly robust infrastructure capable of operating across thousands of institutions, multiple languages, and diverse administrative frameworks.

Community Engagement in India: Policy Framework

India's engagement with community-centred higher education has evolved through several phases. A national review conducted in 2011 by a Committee of Experts set up by the Planning Commission analysed the purposes, principles, and forms of social responsibility relevant to the Indian context, forming the basis for subsequent policy development incorporated into NEP 2020. The Unnat Bharat Abhiyan (UBA) 2.0, launched in February 2018 by the Ministry of Human Resource Development, represents one of the most significant national initiatives for connecting higher education with rural and peri-urban communities. The programme aims to bring about transformative change in rural development through active participation of higher education institutions with local communities. The revised UGC Guidelines for Fostering Social Responsibility and Community Engagement in Higher Education Institutions in India 2.0, published in December 2022, incorporated NEP 2020 recommendations and the experiences of the COVID-19 pandemic. These guidelines prescribe a mandatory two-credit Community Engagement course for all undergraduate and postgraduate students and establish key principles: mutual learning and respect between communities and institutions; university-wide engagement across all disciplines; credit-based participation for students and teachers; and the development of organic and long-term linkages with local governments, district administrations, entrepreneurs, businesses, and NGOs. The guidelines also identify six forms of community engagement: linking learning with community service through service-learning; linking research with community knowledge; knowledge sharing and mobilisation; devising new curriculum and courses; including community practitioners as teachers; and promoting social innovations by students. They recommend Community-Based Participatory Research (CBPR) as the methodology for field-based research, emphasising that communities can be involved as co-researchers and that findings should be shared with community institutions so the community develops ownership of outcomes. At the institutional level, universities have developed operational CEP guidelines specifying credit structures, faculty mentor systems, report submission formats, and evaluation patterns. These provide the operational context within which a system like ICEPMS would function.

Scholarship on Service-Learning and CBPR

The academic literature provides substantial evidence that connecting classroom learning with real community problems produces qualitatively different educational outcomes than traditional classroom instruction alone. Bringle and Hatcher (2000) established that the integration of community service with academic instruction enhances student learning, develops civic responsibility, and strengthens communities. Eyler and Giles (1999) demonstrated that reflection on community experiences is a critical component of the learning process, and that knowledge gained through community engagement is retained more deeply than knowledge gained through simulated exercises. Jacoby (1996) provided a comprehensive framework for understanding how service-learning can be systematically integrated into higher education curricula across disciplines. The broader CBPR literature further supports the premise that communities possess knowledge and expertise that academic institutions can benefit from accessing. Wallerstein and Duran (2010) documented the contributions of CBPR to intervention research, showing that community-researcher partnerships produce more relevant and sustainable outcomes than researcher-driven approaches alone. Israel et al. (1998) provided a comprehensive review of community-based research, demonstrating the value of collaborative knowledge production. Tandon (2007), writing from the Indian context through the Public Resource Centre for Action (PRIA), examined community-university partnerships as a model for research learning and argued that community knowledge should be treated as a legitimate source of academic inquiry.

Identified Gap

Despite this rich policy and scholarly landscape, a significant gap exists in the operational

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

literature on community engagement in Indian higher education. While extensive work addresses the principles, values, and pedagogical foundations of community engagement, comparatively little research has focused on the operational infrastructure required to connect grassroots problem identification with academic delivery systems in a systematic, technology-enabled manner. No published work has, to the authors' knowledge, explored the design of a single-window digital ecosystem integrating multiple community problem-reporting channels, academic credit mapping, project execution tracking, performance monitoring, and performance-based funding facilitation within a unified framework designed for the Indian higher education context.

This gap is the motivation for the present paper.

Methodology

Research Approach

This paper employs a systematic secondary-source analysis methodology. The study develops a conceptual framework through structured analysis of national policy documents, international frameworks, and established scholarship on community-based participatory research and service-learning. This approach is well-suited to framework-proposal research where the contribution is a conceptual model derived from existing knowledge rather than an empirically tested artefact. The framework is developed through iterative synthesis of multiple categories of sources and validated through policy alignment review.

Sources of Evidence

The framework draws on the following categories of sources:

National Policy Documents: NEP 2020 provides the foundational mandate for community engagement in Indian higher education. The UGC Guidelines 2.0 (2022) provide the most detailed operational framework, including principles, curriculum recommendations, assessment patterns, and implementation strategies. The UGC's Vidyanjali letter formally links community service to teacher assessment criteria.

International Frameworks: UNESCO declarations, GUNI reports, and models such as Science Shops and the Talloires Network provide global benchmarks against which the proposed system is measured.

CBPR and Service-Learning Literature: The work of Wallerstein and Duran (2010), Israel et al. (1998), Jacoby (1996), Eyler and Giles (1999), and Bringle and Hatcher (2000) provides the scholarly foundation for community-engaged research and service-learning pedagogy.

Institutional Guidelines: Operational CEP guidelines from Indian universities provide the context for how a digital system would integrate with existing academic processes.

Framework Development Process

The ICEPMS framework was developed through a structured five-step process:

Step 1 - Policy Analysis: A systematic review of NEP 2020, UGC Guidelines 2.0, and institutional CEP guidelines was conducted to identify mandates, principles, and operational requirements.

Step 2 - Gap Identification: Recurring operational themes were identified across the policy and scholarly documents: decentralised problem identification without corresponding academic response; lack of curated problem inputs for credit-based engagement; absence of verified institutional performance records; absence of transparent funding mechanisms; and manual administrative processes that do not scale.

Step 3 - Stakeholder Analysis: Each stakeholder group affected by community engagement was analysed for its needs, capabilities, and current limitations. Five distinct roles were identified: citizens and community reporters, platform administrators, college faculty and administrators, CSR and government funders, and an AI support system.

Step 4 - Framework Design: A five-role digital platform was designed to address all identified gaps simultaneously, with a structured workflow from problem reporting through academic conversion, project execution, performance tracking, and funding facilitation.

Step 5 - Policy Alignment Validation: Each component of the proposed system was checked against NEP 2020, UGC Guidelines 2.0, and institutional CEP guidelines to ensure alignment and to demonstrate that the system operationalises existing mandates rather than proposing something beyond them.

The Icepms Framework

Overview

The Integrated Community Engagement & Project Management System (ICEPMS) is conceived as a unified digital platform serving as a single window for all stakeholders involved in community engagement in higher education. The system is designed around five stakeholder roles connected through a structured five-stage workflow. The workflow illustrates how a community problem moves from reporting through academic conversion, project execution,

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

performance recording, and finally to funding based on verified performance. An AI Engine supports the process throughout by classifying problems, drafting topics, checking reports, and making suggestions.

Stakeholder Roles and Functions

Role 1: Civil Society — Citizens, Gram Panchayat Members, NGOs, and Journalists etc. This group represents the primary source of community problem identification. Any ordinary citizen, NGO worker, journalist, or community representative — including a Gram Panchayat member — can access the platform and report a problem observed in their locality. The reporting interface requires basic information: problem title, description, category (water, sanitation, roads, health, agriculture, electricity, education, or environment), GPS-tagged location, urgency level, and supporting photographs or videos. The platform supports multiple languages to ensure accessibility for users with varying levels of digital literacy. Registration requires only a mobile number with OTP verification, making the system inclusive and straightforward to use. Citizens can also browse the status of problems they have reported and view which colleges are working on issues in their area.

Role 2: Platform Administrator. The administrator manages the platform and serves as the bridge between community problems and academic opportunities. When a problem enters the system, the administrator reviews it and converts it into a structured academic topic. This conversion includes identifying the relevant academic discipline — for example, a water contamination issue maps to environmental science and public health, while a road defect maps to civil engineering — drafting a formal academic project title, determining appropriate credit hours in line with institutional and UGC guidelines, defining learning outcomes, and identifying which colleges and departments are best positioned to undertake the work. The administrator also manages college registrations, monitors platform activity, and maintains the quality and integrity of the system.

Role 3: College Admin / Faculty Mentor. College users access a personalised dashboard displaying all available problems relevant to their discipline and geographic area. Faculty members can browse problems, subscribe to specific challenges, form student teams under faculty mentors, plan and execute CEP in the field, upload field reports and findings, and submit final project reports. If additional research and development funding is required, colleges can submit structured funding requests directly through the platform. The system also allows colleges to view their own performance metrics — problems solved, students engaged, credits generated, project completion rates, and community feedback scores.

Role 4: CSR Administrator / Government Officer / Other Sponsors. External stakeholders — including corporate CSR departments, district administrations, and other funding bodies — access a dedicated performance dashboard. This dashboard displays verified metrics for all participating colleges: number of problems resolved, students engaged, credits earned, project completion rates, quality ratings, community satisfaction scores, and duration of sustained engagement. A geographic map visualises institutional activity across districts, with projects indicated by status — ongoing, completed, or pending. When a college submits a funding request, this request appears alongside the college's complete performance history, enabling funding decisions based on evidence. Funding is not automatic; it is earned based on what the college has already achieved.

Role 5: AI Engine (Cross-Cutting). The AI Engine operates across the entire system rather than as a separate stakeholder, supporting each stage of the workflow. At the problem-to-topic conversion stage, natural language processing (NLP) techniques can analyse the problem description to automatically suggest the appropriate academic discipline, draft a preliminary project title, recommend credit hours, and identify relevant learning outcomes. At the evaluation stage, the AI Engine can perform initial structural checks on submitted project reports — verifying word count, chapter completeness, and reference formatting — before a human evaluator reviews content quality. Recommendation algorithms can match problems with colleges based on disciplinary strengths, geographic proximity, and faculty expertise. Pattern recognition algorithms can analyse the accumulated database to identify recurring problems across regions and areas needing more academic attention. The integration of AI into ICEPMS is intended to address a specific, measurable problem: the administrative bottleneck of converting community problems into academic topics at scale. The human-in-the-loop design — where administrators review and confirm all AI-generated suggestions — ensures that AI serves as an accelerator rather than a decision-maker, preserving the contextual sensitivity that community engagement requires. The purpose of AI in ICEPMS is to handle repetitive, high-volume analytical tasks so that administrators and faculty can focus on the human relationships, contextual understanding, and mentored learning experiences that make community engagement meaningful.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Core Workflow

The ICEPMS operates through a structured five-stage workflow.

Stage 1 - Problem Reporting. Citizens, Gram Panchayat members, NGOs, and journalists report problems through the platform with basic information including title, description, category, GPS-tagged location, and supporting media. Multiple community stakeholders can report the same problem, which strengthens the credibility of the report. The problem is now ready for academic conversion.

Stage 2 - Academic Conversion. A platform administrator reviews the problem and converts it into a credit-mapped academic topic. This includes identifying the relevant discipline(s), drafting a formal academic project title, setting appropriate credit hours aligned with the two-credit structure mandated by NEP 2020 and UGC Guidelines 2.0, and defining learning outcomes. The administrator may also identify the most suitable college or department based on disciplinary strengths and geographic proximity.

Stage 3 - Project Execution. Colleges browse available problems on their dashboard, subscribe to relevant challenges, form student teams under faculty mentors, plan and execute CEP in the field, document their work within the platform, and submit final reports. Throughout this stage, students maintain activity reports as per institutional formats and get them validated by their supervisors, as outlined in institutional CEP guidelines.

Stage 4 - Evaluation and Performance Tracking. Project reports are evaluated through a structured assessment process that includes internal evaluation by faculty mentors and external evaluation by institutional committees, as outlined in existing CEP guidelines. Performance data — including completion rates, quality ratings, community feedback, and student engagement metrics — is recorded and made visible on live dashboards and a geographic map, creating a transparent, verifiable record of institutional community engagement. This performance data becomes the foundation for funding decisions.

Stage 5 - Funding Facilitation. Colleges requiring additional research and development funding submit structured requests through the platform, including project summaries, budget estimates, justifications, expected outcomes, and timelines. These requests appear alongside the college's complete performance history on the CSR/government dashboard. Funding decisions are made based on evidence of sustained and quality engagement rather than informal relationships. The performance data recorded in Stage 4 thus becomes the basis for funding decisions in Stage 5, creating a cycle in which good performance leads to funding, which enables deeper community engagement, which in turn generates further performance data.

System Design Considerations

Several design principles guide the development of ICEPMS:

- **Simplicity for end users.** Citizens and local representatives should be able to report a problem with minimal effort — ideally through a mobile-friendly interface functioning on basic smartphones. Multi-language support is essential given India's linguistic diversity. The platform should be accessible to users with limited digital literacy.
- **Role-based access control.** Each user role has clearly defined permissions, ensuring that citizens cannot alter academic topics, colleges cannot modify their own performance data, and sponsors can view but not alter institutional records.
- **Transparency with privacy protection.** The live map and performance dashboards provide transparency for funding decisions, while sensitive personal data of citizens and students is protected through appropriate data governance frameworks.
- **Modularity and adaptability.** The platform is designed as a modular system that can be implemented at a single college level, scaled to a district or state level, and connected to a national framework over time. Different states and institutions can adapt the platform to their specific contexts while maintaining interoperability.
- **Offline capability.** Recognising that internet connectivity may be inconsistent in rural areas, the system should support offline data entry with synchronization when connectivity is restored.

Alignment with Policy Frameworks

National Education Policy (NEP) 2020

NEP 2020 provides the foundational mandate for ICEPMS. The policy requires that the flexible and innovative curricula of all higher education institutions shall include credit-based courses and projects in community engagement and service, calling for producing engaged, productive, and contributing citizens for building an equitable, inclusive, and plural society. ICEPMS achieves this integration by making community problems the direct input to academic work, with the platform ensuring that community engagement is embedded in the regular curriculum rather than treated as an

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

isolated activity. The policy's emphasis on producing engaged, productive, and contributing citizens is realised through concrete, documented, community-identified projects rather than through abstraction.

UGC Guidelines 2.0 (2022)

The UGC's revised guidelines provide direct policy alignment for ICEPMS across several principles. The principle of mutual learning and respect is fulfilled because ICEPMS ensures that both community and higher education institution benefit - communities gain access to academic expertise; students gain real-world learning. The principle of credit-based participation is fulfilled because every solved problem generates verifiable academic credit, implementing the guideline that participation in community engagement should earn credits and be integrated into assessments. The principle of university-wide engagement is fulfilled because the platform is discipline-agnostic, enabling participation from engineering, sciences, humanities, commerce, and management. The principle of credit for teachers is supported because the platform creates a verifiable record of faculty engagement activities. The principle of linkages with local institutions is operationalised because the platform formally connects panchayats, municipalities, NGOs, and CSR bodies with higher education institutions through a structured digital platform.The UGC Guidelines 2.0 also call for a national knowledge platform on Community Engagement and Social Responsibility that can synthesise field case studies and create teaching resources. ICEPMS envisions such a platform — one that generates a structured database of community problems, institutional responses, and development outcomes. The guidelines further recommend that national accreditation agencies include indicators and weightage of community engagement in teaching and research. The data infrastructure generated by ICEPMS would make such indicators measurable, which is not currently possible with existing systems.

Institutional CEP Guidelines

Universities have developed operational CEP guidelines specifying credit structures, faculty mentor systems, report submission formats, and evaluation patterns. ICEPMS is designed to accommodate these institutional requirements, supporting report submission, mentor tracking, evaluation workflows, and the maintenance of interaction diaries as specified by institutional norms. This design ensures that ICEPMS integrates with existing academic processes rather than creating parallel administrative burdens.

Conclusion and Future Directions

The Integrated Community Engagement & Project Management System (ICEPMS) addresses an operational difficulty that has limited the effectiveness of community engagement policies in Indian higher education. India has established comprehensive mandates for community engagement through NEP 2020, UGC Guidelines 2.0, and institutional frameworks. What has been missing is the operational infrastructure to connect community problem identification with academic response, and institutional effort with verified, transparent trust. ICEPMS proposes a single-window digital ecosystem where citizens, Gram Panchayat members, NGOs, and journalists report problems; administrators convert them into credit-mapped academic topics; colleges and students execute community engagement projects; performance data is recorded transparently; and CSR departments, government officers, and other sponsors fund further research based on verified institutional performance. The system aligns with the mandates of NEP 2020, UGC Guidelines 2.0 (2022), and institutional CEP frameworks. It operationalises the principles of mutual learning, credit-based participation, organic institutional linkages, and research in partnership with communities. The integration of artificial intelligence into the problem-to-credit mapping process is a distinctive feature of ICEPMS. Without AI assistance, the administrative workload of converting thousands of community problems into properly scoped academic topics would be substantial. With AI assistance, the same process becomes faster, more consistent, and scalable — while human judgment remains central to academic and community-facing decisions.

Limitations

This paper has several limitations that should be acknowledged. First, the framework presented is a conceptual proposal that has not been empirically validated through implementation or field testing. The system design is based on analysis of policy documents and existing literature rather than on practical deployment experience. Second, the paper does not include detailed technical specifications for the AI Engine or the database architecture, as these would require specialised technical expertise beyond the scope of this conceptual paper. Third, the paper does not address the specific funding mechanisms or budget estimates required for developing and deploying such a system at scale. Fourth, the alignment analysis with policy frameworks is based on

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

document review rather than on empirical observation of how these policies are implemented in practice. Fifth, the paper does not include perspectives from all potential stakeholder groups — particularly community members themselves, whose experiences and needs should inform any system designed to serve them. These limitations are acknowledged not as weaknesses but as boundaries that define the scope of this contribution and identify directions for future work.

Future Directions

Future work in several directions would strengthen and extend this contribution:

Prototype development and pilot testing: Building a working prototype of ICEPMS and testing it with a select group of colleges, local governance bodies, and CSR departments in one districts would provide practical insights into usability, effectiveness, and areas requiring refinement.

AI model development and validation: Developing and training NLP models for problem classification and academic topic generation, and validating their accuracy against human expert assessments, would strengthen the technical foundation of the AI Engine.

Stakeholder evaluation: Conducting surveys and interviews with citizens, local representatives, faculty, and CSR officers would provide evidence on the usability, relevance, and perceived value of the platform from the perspective of its intended users.

Longitudinal impact tracking: Following community problem resolution rates, student learning outcomes, institutional engagement metrics, and funding flows over multiple semesters would generate evidence of the platform's long-term impact.

Regional adaptation research: Investigating how ICEPMS can be adapted for different linguistic, cultural, and administrative contexts across Indian states would inform the scalability of the system.

Data governance development: Designing and testing data privacy, consent, and governance protocols that protect citizen and student data while enabling the transparency required for trust-building and funding decisions would address a foundational requirement for any real-world deployment.

Acknowledgement

The authors would like to express their sincere gratitude to all those who contributed directly and indirectly to the completion of this research paper entitled "An Integrated Community Engagement & Project Management System (ICEPMS): A Single-Window Digital Ecosystem for Research & Development in Higher Education Institutions in India."

Abstract

India's digital transformation is creating a growing need for intelligent systems that can operate reliably across diverse sectors and linguistic settings. This paper presents a conceptual review of the relationship between artificial intelligence (AI), mathematics, and India's digital development. The discussion focuses on agriculture, education, banking and financial services, legal services, transportation, digital commerce, and industry. Particular attention is given to the mathematical ideas that underpin AI: linear algebra for representing data and parameters; probability and statistics for uncertainty and inference; calculus for gradient-based learning; and optimization for selecting model parameters and making decisions. Mathematical modelling is further considered as a bridge between real-world systems and data-driven methods. The paper also examines responsible and inclusive AI, emphasizing reliability, privacy, fairness, transparency, security, accountability, and human oversight. India's national AI strategy and the India's AI Mission provide a policy context for these developments, while recent international assessment work highlights the importance of human-centred and ethical deployment. The paper argues that India's long-term AI capacity should be developed through a coordinated emphasis on computing infrastructure, high-quality data, mathematical education, interdisciplinary research, multilingual technologies, and responsible governance.

Keywords: *Artificial Intelligence, Mathematics, Digital Transformation, Digital India, Mathematical Modelling, Machine Learning, Responsible AI*

Introduction

Artificial intelligence has moved from a predominantly research-oriented field to a general-purpose technology used in prediction, classification, language processing, recommendation, automation, and decision support. Modern AI systems combine data, algorithms, computational resources, and domain knowledge; their performance therefore depends on more than the availability of software alone [5], [6]. The Indian context is distinctive because digital services must operate at large scale and across substantial linguistic, geographic, economic, and institutional diversity. NITI Aayog's National Strategy for Artificial Intelligence identified AI as an opportunity for inclusive growth and highlighted areas such as healthcare, agriculture, education, smart cities, and mobility [1]. More recently, the India AI Mission has organized national efforts around compute capacity, datasets, foundation models, future skills, application development, startup financing, and safe and trusted AI [2]. The main proposition of this paper is that mathematics should not be treated as a background subject separate from AI. Mathematical structures are used to encode observations, express uncertainty, learn parameters, optimize objectives, reduce dimensionality, and evaluate models. A stronger connection between undergraduate mathematics education and AI can therefore contribute to both technical capability and informed use of AI. **Ai And India's Digital Transformation**

Multilingual Access and Digital Inclusion

India's language diversity makes speech and language technologies particularly significant. Automatic speech recognition, machine translation, natural-language processing, and voice interfaces can make digital services more accessible to people who are not comfortable using English.

Website: https://bnir.us

The practical quality of these systems, however, depends on representative datasets, careful evaluation, and attention to variation among speakers and language communities. NITI Aayog's national AI strategy also recognized language technology as an important route toward broader access to digital services [1]. **B. Productivity and Economic Activity** AI can support forecasting, resource planning, quality inspection, customer support, anomaly detection, and predictive maintenance. In agriculture, data from weather services, remote sensing, soil measurements, and markets can be combined to support decisions. In manufacturing, sensor observations can be analysed to identify patterns that may indicate equipment problems. Such applications should be evaluated against real operating conditions rather than only laboratory accuracy.

Infrastructure, Data, and Skills

Successful AI adoption requires a complete ecosystem: computational resources, reliable and well-documented datasets, trained personnel, research institutions, application developers, and governance mechanisms. The IndiaAI Mission reflects this ecosystem approach by combining infrastructure, data, skills, applications, innovation, and safe and trusted AI [2]. Mathematical literacy is part of this skill base because many AI methods depend on quantitative reasoning rather than on programming alone.

Applications of Ai in India

Agriculture

AI can be used as a decision-support layer in agriculture. Image-based methods may assist with identification of visible crop symptoms, while weather and soil observations can inform irrigation or cultivation planning. Market information can also be analyzed for demand and price patterns. These systems are most useful when they work with farmers, agronomists, and local knowledge rather than attempting to replace domain judgment [1].

Education

AI-supported educational platforms can adjust the sequence or difficulty of practice material according to observed learner performance. For mathematics, a system may recommend additional examples after an incorrect response or provide a different explanation of the same concept. Language technologies can also improve access to learning resources in Indian languages. At the institutional level, AI may reduce some routine information management tasks, allowing teachers to devote more time to teaching and interaction.

Banking and Financial Services

Financial institutions can use machine-learning methods for transaction monitoring, anomaly detection, fraud analysis, risk estimation, customer support, and information retrieval. Because automated decisions may affect access to financial services, accuracy should be considered together with privacy, fairness, explain ability, security, and appropriate human review [3].

Judiciary and Legal Services

Legal institutions handle large collections of documents and records. AI can assist with document classification, search, translation, summarization, and records management. These uses may reduce repetitive administrative work, but the interpretation of law and responsibility for consequential decisions should remain subject to qualified human oversight.

Transportation and Traffic Management

Traffic systems generate information from cameras, sensors, maps, and connected infrastructure. AI can use these streams to estimate traffic conditions, identify recurring patterns, and support route or signal-management decisions. Because transportation systems are safety-critical, reliability and monitoring are essential.

Digital Commerce and Delivery

Recommendation systems can rank products using interaction data, while forecasting models can estimate demand across locations and time periods. Better forecasts can support inventory planning and delivery operations. However, recommendation and ranking systems should also be examined for unwanted bias and excessive collection of user data.

Industry and Workplace Safety

Industrial AI can analyses vibration, temperature, acoustic signals, and other sensor measurements to identify unusual behavior. Predictive maintenance can provide an early warning of equipment degradation, and computer vision can assist with inspection. Human safety remains the primary criterion when AI outputs influence physical operations.

Mathematical Foundations of Artificial Intelligence

The mathematical structure of a learning system can be introduced through a dataset of observations. Let $x \in R^n$ denote an input vector and let θ represent the parameters of a model. A prediction can be expressed as:

$\hat{y} = f(x; \theta)$

For a linear model, the prediction has the form:

$\hat{y} = w^T x + b$

Here, w is a parameter vector and b is a bias term. The expression illustrates how linear algebra

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

provides a compact language for observations, parameters, and transformations. Matrix operations become especially important when thousands or millions of observations are processed simultaneously [5], [7].

Probability and Statistics

AI systems frequently operate with incomplete information. Probability provides a formal way to represent such uncertainty, while statistics provides methods for estimating parameters and evaluating models. A basic relationship between conditional and prior probabilities is Bayes' theorem:

$P(y|x) = P(x|y)P(y) / P(x)$

Probabilistic reasoning is relevant to classification, inference, uncertainty estimation, sampling, and model evaluation. Statistical thinking is also important when judging whether an observed improvement is meaningful or whether a model generalizes beyond its training data [7], [8].

B. Calculus and Model Learning Suppose a differentiable loss function $L(\theta)$ measures the discrepancy between predictions and desired outputs. The gradient contains the partial derivatives of L with respect to the model parameters. A basic gradient-descent step is:

$\theta_{k+1} = \theta_k - \eta\nabla L(\theta_k), \eta > 0$

The learning rate η controls the size of the parameter update. Thus, calculus connects a change in model parameters with a change in the objective being minimized [6], [8].

Optimization

Training may be written as an optimization problem in which the parameter vector is selected to minimize a loss over training data D:

$\theta^* = \arg\min_\theta L(\theta; D)$

Optimization is not restricted to neural-network training. It also appears in routing, scheduling, allocation of computational resources, and many other digital decision problems. Convex optimization provides a useful framework for understanding problems in which the objective and constraints have favourable mathematical structure [9].

Linear Algebra and Dimensionality Reduction

High-dimensional observations are commonly stored as matrices. Eigenvalues, eigenvectors, singular-value decomposition (SVD), and related techniques can reveal dominant directions or lower-dimensional representations. Dimensionality reduction can decrease computational cost and sometimes make important structure easier to interpret [7], [8].

Mathematical Modelling

Mathematical modelling represents a real system through variables, relationships, constraints, and measurable quantities. Data-driven AI can complement such models by learning relationships that are difficult to specify explicitly, while mathematical constraints can restrict outputs to physically or logically meaningful regions. This hybrid perspective is useful in agriculture, climate analysis, economics, transportation, and industrial systems.

Cryptography and Cybersecurity

Discrete mathematics, number theory, algebra, probability, and related areas contribute to the mathematical basis of cryptographic systems. AI can complement security mechanisms by identifying anomalous behaviour or patterns in large streams of observations. The combination therefore involves both mathematical security guarantees and data-driven detection methods.

A Simplified Ai System Workflow

A practical AI system can be viewed as a sequence of stages: data acquisition and preparation, perception or feature extraction, interpretation, prediction or decision, and communication of the resulting output. The exact architecture depends on the application and may combine machine-learning, rule-based, database, and knowledge representation components.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Fig. 1. Simplified AI workflow and functional components.

For example, in a voice-based service, audio processing first receives speech, a language-processing component interprets the request, relevant information is retrieved, and a machine-learning or rule-based component helps produce a response. Each stage can introduce errors, so evaluation should consider the complete pipeline rather than a single algorithm.

Responsible and Inclusive Ai

The benefits of AI depend on the conditions under which systems are designed, trained, deployed, and monitored. NITI Aayog's responsible-AI framework identifies principles including safety and reliability, equality, inclusivity and non-

Discrimination, privacy and security, transparency, accountability, and protection of positive human values [3]. These principles are relevant across public and private applications, although the appropriate safeguards depend on the context. Recent work by UNESCO and the Ministry of Electronics and Information Technology on India's AI readiness further emphasizes an ethical and human-centred approach. The 2026 assessment was developed through consultations involving government, startups, research institutions, academia, and civil society [4]. This supports the view that responsible AI is not solely a technical problem; it also requires institutions, domain expertise, public participation, and clear accountability. Mathematics and statistics can contribute by measuring uncertainty, error, robustness, calibration, and selected fairness indicators. Nevertheless, a numerical metric cannot by itself decide whether a system is socially desirable. Human oversight and institutional processes remain necessary, particularly when AI affects education, finance, legal services, employment, or access to public benefits. Digital inclusion should therefore be treated as a design objective. Multilingual datasets, accessible interfaces, appropriate computing infrastructure, teacher and professional training, and transparent evaluation can help ensure that the benefits of AI are distributed more broadly.

Discussion

The review indicates three closely related roles for mathematics in India's AI ecosystem. First, mathematics is an algorithmic foundation: vectors, matrices, probability distributions, derivatives, and optimization objectives appear directly in many learning methods. Second, it provides a bridge between AI and application domains because real systems can be represented through variables, equations, constraints, and measurable outcomes. Third, mathematical and statistical reasoning supports evaluation by making uncertainty, error, robustness, and other properties measurable. This perspective has implications for AI education. Undergraduate students need not encounter AI only as a collection of programming libraries. Examples such as linear prediction, probabilistic classification, gradient descent, matrix factorization, and optimization can connect familiar mathematics to contemporary computational practice. Such integration can strengthen conceptual understanding while also giving mathematics students a pathway toward interdisciplinary research and AI-related skills. For India, the educational challenge is therefore two-sided: AI practitioners need sufficient mathematical understanding to analyze model behavior, while mathematics students can benefit from computational examples that demonstrate the practical value of abstract concepts. Collaboration among mathematics departments, computer-science groups, domain specialists, and policy institutions can help develop this ecosystem.

Conclusion

Artificial intelligence has the potential to support India's digital transformation in

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

agriculture, education, finance, legal services, transportation, commerce, and industry. The effectiveness of these applications, however, depends on a combination of reliable data, computing infrastructure, skilled people, appropriate models, and responsible governance. Mathematics provides a common foundation for many of these activities. Linear algebra supports data representation and transformations; probability and statistics provide tools for uncertainty and inference; calculus enables gradient-based learning; and optimization formalizes parameter selection and decision problems. Mathematical modelling can further connect data-driven techniques with domain constraints and scientific understanding. A sustainable Indian AI ecosystem should therefore develop infrastructure and skills in parallel with mathematical and statistical education. Future research can extend this conceptual review through empirical studies of sector-specific AI systems, quantitative evaluation of multilingual models, mathematical models for inclusive digital services, and systematic assessment of responsible-AI practices in Indian institutions.

Abstract:

The Artificial Intelligence (AI) writing tools like ChatGPT and Claude have changed the world of official and unofficial communication in last two to three years. The human style of writing is diminishing and there is a rise of only one universal writing style created by the AI tools which lack human expressions and creativity. The AI tools are rampantly used by students, researchers, writers and people in general for any kind of serious as well as casual writing today. The excessive use of AI tools in writing is also responsible for reducing human ability of logical and critical thinking. Therefore, there is an urgency of using AI writing tools wisely so that the human writing skills get enhanced and the tools prove to be a boon. This research paper examines the challenges posed by AI writing tools and discusses how the AI can be used effectively and responsibly to enhance human writing skills.

Key Words: *language skills, style of writing, AI tools, prompts, human expressions, creativity*

Introduction:

The AI writing tools like Chat Generative Pre-trained Transformer (ChatGPT) and Claude were introduced in 2022 and 2023 respectively. Since then, people have become reliant on the tools for any kind of writing. The tedious task of writing has become easier and comfortable. One has to just give appropriate prompt and the written text is ready in few seconds. This has given great relief to the people who are weak in writing skills. However, this has also stopped people from thinking logically and creatively as they used to do while writing, before the introduction of the AI tools. This has diminished their ability to write independently. AI writing tools which should have been a great assistance in the enhancement of writing skills have proved to be an obstacle in the learning of the language skill. However, a wise use of the same can be very advantageous.

Language Learning and AI Writing tools: When one learns a language, one learns how to listen, speak, read and write in that language. Only after mastering the four language skills, one can say that they have a good command over the language. Listening and reading are receptive skills whereas speaking and writing are productive skills. While performing the receptive skills, only the mental process takes place and the individual is passive physically. Whereas during the use of the productive skills, the individual has to be active mentally as well as physically. They have to produce the words. In listening and reading, the learner understands words and sentences without producing them. There is no fear of making mistakes. Understanding takes place in a relaxed manner. Whereas in productive skills like speaking and writing, there is the fear of making grammatical mistakes and using the appropriate words in appropriate contexts. Therefore, for mastering the productive skills, the learner has to take deliberate and additional efforts. This is one of the reasons why learners are generally weak in speaking and writing skills. Hessah Saleh Aldayel and others argue "Writing is widely recognized as one of the most challenging skills for students learning English as a Foreign Language (EFL), especially those enrolled in English education programs". [1] In this situation, if AI tools come for one's help, especially for writing, who would say no to it? In Indian classrooms at the school as well as college level, when we think of teaching and learning of the English language in general, the focus is more on the theoretical aspect of the language. The class is more teacher-centric and the learners master the listening skills more and reading skills comes after that.

Website: https://bnir.us

Writing is performed by the students intermittently, mainly at the time of examinations. Speaking in English rarely takes place. Since only the teacher speaks most of the time, the learners become good listeners. Reading takes place as they read at least the prescribed books. However, they are weak in speaking and writing skills. Consequently, in real life situations, for most of the learners writing becomes a tedious task. One has to think of appropriate words, phrases and needs to do grammar and spelling check. Not only that, to put the ideas logically one needs to write many drafts before the final draft. People do not want to spend time and energy in doing this wearisome task. In this situation, they happily prefer to take the help of the writing tools like ChatGPT and Claude. The AI tools like ChatGPT and Claude are great assistance in writing in English. One can write articles, reports, letters, speeches, stories, and research papers also with the help of the AI tools. Most importantly, when one gives prompt to the AI writing tool and ask to write a text, one does not have the fear of making any grammatical or spelling errors. That is the first relief that one gets due to the tool. Secondly, AI writing tool saves time and energy as it provides the text within few seconds after entering the prompt. The energy that one spent earlier in writing drafts, editing, proofreading and revising the text is saved here. The AI tool gives you synonyms and antonyms of words so that one can choose the appropriate words in appropriate contexts. It can rephrase the ideas in many ways and one can choose the best option. By giving appropriate and correct prompts one can make the text formal, informal or customise it for basic, intermediate or advanced level. More interestingly, AI tool can work on the human made draft of writing and it can improvise it for effectiveness. AI tools help in generating ideas and organising them in logical orders. Logical organisation of the ideas is the most challenging task that humans face while writing a text. One can have very meaningful and powerful ideas but putting them together in a systematic and logical manner needs great skills. Only sustained and consistent efforts and practice make one a good writer who can easily put the ideas in that manner. However, everybody is not a good writer. In this case, the AI writing tool does the needful. It presents the ideas in effective ways for you without taking much time and efforts. If one gives key points to AI tool, it can explain the points in paragraphs by giving appropriate examples too. That's the reason why people prefer to use the AI writing tools. AI tools have their own unique style of writing. It is a machine generated style shaped out of the content and patterns publicly available on the internet. The style takes its form out of the existing text on the internet. As per the given prompt and context, it identifies the linguistic pattern available on the internet and generates the text accordingly. Therefore, it uses common phrases, expressions and rhetorical patterns that are available to it. Looking at the predictable sentence structure and vocabulary, one can easily identify that the text is the creation of AI. The text created by AI tool is generally very structured, formal, and have neutral tone. It has similar stylistic pattern. As one can easily identify the images and videos created by AI, if studied closely, one can understand the textual creation of AI. The AI style of writing in English can be easily recognised. Style of writing is determined by the choice of words and patterns of sentences one uses in their writing. Some writers use simple and easy-to-understand words and short sentences whereas some writers may use complex words and lengthy sentences. The choice of words and sentence pattern give a kind of rhythm and flow to the written text. This makes their style of writing distinctive. Writing style also includes the imagery and the figurative language, one uses. The use of imagery makes the reader feel the experience of the writer more vividly. It creates pictures of the description in the mind of the reader. The figurative language including metaphor, simile, personification, symbolism, hyperbole, etc. makes the writing imaginative and emotional. This can be achieved naturally through human writing. Human style of writing has the touch of personal experiences, imagination and individual perspective making it more original and authentic. Humans can write stories, autobiographies, biographies, etc. based on real-life experiences by bringing in their biases, attitudes, beliefs and memories. AI generally does not express very strong personal opinions. It lacks personal voice. It may create some imaginary situations but cannot tell us lived experiences as a human writer does. Thomas Hellstrom writes, "Another fundamental limitation of LLMs (Large Language Models like ChatGPT, Claude, etc.) is that they cannot generate text from a first-person perspective. For example, an LLM can be asked to write about life in prison, but the result would be generated by mimicking people's descriptions of life in prison, rather than being based on the LLMs' own experiences of being in prison."[2] The AI tools borrow things from other sources and present them very systematically and intelligently. All human writers' life experiences are unique. Therefore, whatever a human writer writes based on their experiences is a new creation. Their styles of writing are the outcome of their experiences, worldviews and perspectives created by their socio-cultural backgrounds. Therefore,

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

their style of writing is original and authentic and it enriches all kinds of literature. All the great writers across the world have their own unique individual style of writing due to their individual word choice, sentence pattern and length, rhythm, choice of themes, etc. Every writer has his/her voice reflected in their literature. The reflection of emotional and personal elements in human style of writing makes the style distinctive. Human style of writing is natural and varied. This diversity and originality of writing styles make literature more engaging, appealing and enjoyable. Human writing style is superior to AI writing style in respect to individuality, lived experience, emotional expression, creativity, authorial voice, etc. It cannot be replaced by any AI tools. One cannot neglect the harm that AI tools have done as far as writing is concerned. People in general, even good writers are dependent on AI tools nowadays. According to the article on The Intuitive Writing School website, "And even if they (people) have a good brain for writing, they're going to lose that ability the more they have the machine write for them."[3] The excessive reliance on AI has been resulting in gradual loss of individual human style of writing. This has weakened the unique voice and personal style of the writer. The human ability of thinking on original ideas by using imagination and creativity has stopped as AI provides everything easily. Since all the ideas and arguments are generated by AI, nobody takes efforts to analyse and develop their own thoughts. As humans have forgotten memorising multiplication tables due to the invention of calculators and smartphones have made us forget the telephone numbers of our dear ones, the excessive reliance on AI writing tools will snatch away our ability of writing. The human cognitive ability of critical thinking, reasoning and problem-solving will be affected adversely. Thus, the Artificial Intelligence will weaken the Natural Intelligence of humans. In future, there would be pool of literature created by AI but it would be devoid of genuine feelings, empathy and personal experience. It has been observed that AI sometimes provides biased, incorrect, misleading and fabricated information. Therefore, one cannot rely completely on AI tools of writing. If everyone continues using AI tools for writing purpose, in future there would be only one style of writing which would sound similar everywhere. The human style of writing will diminish. The AI writing tools would not cause the death of only the human style of writing but even the authorship. Authorship becomes a question as human may write the prompt, but the machine generates the actual sentences. AI can generate text by using formal, informal, descriptive, narrative, expository, persuasive or analytical styles. Not only that but there are tools and softwares called AI humanizer which transform AI generated texts into more natural and personal texts. This makes one feel that the text is written by a human. As a result of this, the number of authors publishing books written with the help of AI is increasing rapidly. AI tool becomes a pseudo writer for them and they present the creation of AI as their own. This brings the death of the original author. There is also the possibility of academic dishonesty and plagiarism in the world of AI. The assignments, essays, research papers, projects, thesis, dissertations, etc. are written by using AI writing tools. The AI tool can offer you a research proposal which may need years to be completed if actually undertaken. However, the same AI tool can give you the completed report of the same research project within few seconds. This really questions the academic integrity of the researchers. Moatsum Alawida writes, "Many academic institutions have prohibited its (ChatGPT's) use. Because its outputs are based on human-generated texts, researchers and creatives have been concerned about copyright infringement."[4] Any technology when used inappropriately and irresponsibly can turn into a curse. Elon Musk says, "AI is a double-edged sword that can do good-but also destroy civilization".[5] The rampant and blind use of AI writing tools is harmful for human style of writing. However, if it is used wisely and intelligently, it can prove to be a boon. Smart use of AI writing tools can really help one to become a good writer. It can enhance one's writing skills. AI tools can be used for brainstorming ideas which should be developed by the writers independently as per their own imagination and creativity. It can be used for finding synonyms, antonyms, idiomatic expressions and searching alternative ways for expressing an idea. It should be used to find out suitable words in suitable contexts. AI can provide different ways of structuring sentences. The best use of AI tools can be made in identifying grammatical, spelling, punctuation and sentence formation errors. Interestingly, a writer can learn from these corrections and avoid the mistakes in future. Instead of asking for automatically generated complete answers, the writers should challenge their questions, identify gaps, provide counterarguments and raise questions to the AI writing tools to develop critical thinking. Asking AI to evaluate one's writing texts, one can improve the weaker areas of writing skill. This is how AI tool should be used wisely as an assistant to enhance one's writing skills and it should not be made one's pseudo writer. Only then, the human style of writing will survive.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Conclusion:

In the English language learning process, having command over the four language skills like listening, speaking, reading and writing is very important. For mastering speaking and writing skills, one has to take great efforts. AI tools like ChatGPT and Claude can be great assistance in the enhancement of the language skills. However, the excessive reliance on AI tools for obtaining readymade written texts has diminished the human style of writing which is unique due to the personal experiences, individual perspectives and creativity of the writer. The AI has created a universal style of writing which can be recognised by the commonly repeated phrases, expressions and rhetorical patterns. The excessive use of AI tools have weakened the natural human capacity of critical thinking and independent reasoning. They have become an obstacle in independent creation and imagination of human beings. Therefore, the AI writing tools have to be used very wisely and intelligently so that they assist in the enhancement of the writing skills. While performing writing skills one can use ChatGPT for finding appropriate words for appropriate contexts. It can also be used to review grammar and spelling errors. This can make one learn a lot of things with respect to the writing skill in English. The wise use of AI writing tool as an assistant will certainly enrich the human style of writing and will turn AI into a boon.

Acknowledgement

I would like to express my sincere gratitude to all those who have contributed, directly or indirectly, to the completion of this research paper entitled **"Death of Human Style of Writing in the World of AI."** This paper examines the growing influence of Artificial Intelligence writing tools such as ChatGPT and Claude on human writing, language skills, creativity, critical thinking, and individual expression.

Abstract:

The concept of sustainable development is very important in modern times. In sustainable development, importance is given to socio-economic and environmental development. 17 goals have been identified to achieve sustainable development. While considering these goals, the sustainability of Dr. Ambedkar's thoughts is also being highlighted. His thoughts also reflect various aspects of sustainability such as poverty eradication, inequality eradication, good health and welfare, quality education, gender equality, and economic growth. The main objective of this research paper is to study how useful Dr. Ambedkar's thoughts are in this concept. Descriptive and analytical research methods have been adopted for the presented research paper. Also, secondary sources have been used as a source of information. When considered in the context of sustainable development, Dr. Ambedkar's thoughts are analogous to the goals of sustainable development. If sustainable development is to be achieved, it is possible to create an equitable, just, and inclusive society by keeping Dr. Ambedkar's thoughts in mind; therefore, Dr. Ambedkar's thoughts are as effective and useful today as they were then. Dr. Ambedkar's thoughts are still a guide for creating an egalitarian society. In the present research paper, when the goal of sustainable development and the thoughts of Dr. Ambedkar are studied, it is found that out of the 17 goals of sustainable development, Dr. Ambedkar's thoughts show similarity with 10 goals. Therefore, even in contemporary times, Dr. Ambedkar's thoughts are still guiding and useful for the welfare of society, for eliminating inequality in society, establishing economic equality, and preserving human dignity.

Introduction

The concept of sustainable development is very important in modern times. In sustainable development, importance is given to socio-economic and environmental development. While pursuing sustainable development, efforts aim to meet present needs while also ensuring that future generations' needs are met. While focusing on this, an attempt is made to achieve this sustainable development without making any compromise.17 goals have been identified to achieve sustainable development. While considering these goals, the sustainability of Dr. Ambedkar's thoughts is also being highlighted. His thoughts also reflect various aspects of sustainability such as poverty eradication, inequality eradication, good health and welfare, quality education, gender equality, and economic growth. The concept of sustainable development and Dr. Ambedkar's thoughts include important aspects of inclusiveness and equal opportunities. Even while providing inclusiveness and equal opportunities, the importance given to the dignity of the individual and social justice is also found in Dr. Ambedkar's thoughts and the concept of sustainable development.

The concept of sustainable development prioritizes the creation of an egalitarian society. The main objective of this research paper is to study how useful Dr. Ambedkar's thoughts are in this concept.

Objectives :

1. To explain the concept and nature of sustainable development.
2. To study Dr. Ambedkar's thoughts in the context of sustainable development.
3. To highlight the importance of Ambedkar's thoughts in the context of contemporary sustainable development.

Research Methodology :

Descriptive and analytical research methods have been adopted for the presented research paper. Also, secondary sources have been used as a source of information. Also, the conclusion of this research paper has been drawn on the basis of secondary information only.

Sustainable Development: Concept and Nature

'Sustainability is the long-term viability of a community's social institutions or social practices.'[1] Sustainability is seen as a form of intergenerational ethics, in which the social, environmental, and economic actions of present individuals ensure that future generations have the opportunity to enjoy the wealth, basic resources, and well-being of the present. The concept of sustainable development is based on this.'The concept of sustainable development is very recent. It first appeared in the Brundtland Report, established within the framework of the World Commission on Environment and Development (WCED) in 1987, chaired by Gro Harlem Brundtland. The Brundtland Report gave birth to sustainable development as a concept. A few years later, in 1997, it was the Earth Summit in Rio de Janeiro where the concept of sustainable development became official.'[2] 'Gro Harlem Brundtland defines it as: 'development that meets the needs of the present without compromising the ability of future generations to meet their own needs.'[3]'There are three pillars of sustainable development. 1. Social pillar 2. Economic pillar 3. Environmental pillar.'[4] To achieve sustainable development through these three pillars of Sustainable Development, it must be economically efficient, environmentally sustainable, and socially just. 'As a guide to achieving sustainable development, the United Nations approved the 2030 Agenda for Sustainable Development in September 2015.'[5] 'World leaders came together in 2015 and made a historic promise to secure the rights and well-being of everyone on a healthy, thriving planet when they adopted the 2030 Agenda for Sustainable Development and its 17 Sustainable Development Goals (SDGs).'[6] It set out the Sustainable Development Goals. Also known as the Global Goals. Through these goals, a series of comprehensive efforts have been created to protect the planet and achieve social well-being. Through these goals, nations have committed to do all that is necessary to implement the agenda by 2030, that is, in the next 15 years. The United Nations has set a total of 17 Sustainable Development Goals to address the economic, social, and environmental challenges facing the world. The goal of achieving each of these 17 goals is set for 2030.

Sustainable Development Goals :

'1. No poverty
2. Zero hunger
3. Good health and well being
4. Quality education
5. Gender equality
6. Clean water and sanitation
7. Affordable and clean energy
8. Decent work and economic growth
9. Industry, innovation and infrastructure
10. Reduce inequalities
11. Sustainable cities and communities
12. Responsible consumption and production
13. Climate action
14. Life below water
15. Life on land
16. Peace, justice and strong institutions
17. Partnerships for the goals'[7]

Sustainable Development and Dr. Ambedkar's Thoughts :

No poverty : Poverty eradication is an important goal of the Sustainable Development Goals. 'Poverty is caused by various factors such as unemployment, social exclusion, and the vulnerability of certain populations to disasters, epidemics, and other crises.'[8] Just as economic factors are important for poverty, social factors are also important. Therefore, poverty eradication is not only about economic reform, but also about social protection. Dr. Ambedkar's social and economic thoughts include poverty eradication. Ambedkar expressed his views on giving an important place to the working class and the poor in the planned development of the country. He presented the idea of development that would not only be beneficial to the development program but also to the common man. 'He proposed various measures to eradicate poverty, including peace, shelter, adequate clothing, education, good health, and all this with dignity. Dr. Ambedkar suggested various measures to eradicate poverty, such as increasing the standard of living of all people, providing employment, providing free education, industrial development, and ensuring equal rights for all over the country's wealth, and making the

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

government responsible for providing all the above facilities to every person.'[9]

Good health and well being : Good health and well-being are the third goal of sustainable development. This goal emphasizes efforts to maintain good health and achieve well-being in society. Dr. Ambedkar also gave importance to good health and welfare and suggested that 'the government should take responsibility for the good health of every individual in society. The government should make efforts for welfare facilities.'[10] Dr. Ambedkar had created labor laws to protect the health of workers and tried to implement them. He also created various measures for women workers in terms of women's health. He had suggested and worked on important reforms such as equal pay and maternity leave.

Quality education : 'Education is the cornerstone that allows us to achieve many other Sustainable Development Goals. When people have access to quality education, they can finally break free from the cycle of poverty. Beyond securing free primary and secondary schooling for all boys and girls by 2030, Goal 4 aims to provide equal access to affordable vocational training, eliminate gender and wealth disparities, and ensure universal access to quality higher education.'[11] Dr. Ambedkar also tried to make education free and compulsory for all. 'He had stated that the issue of universal education is not something that can be solved piecemeal. It must be solved through a unified policy. All provinces should have equal educational progress, and the provincial government must take all the responsibility on itself.'[12] 'He advocated education for boys as well as girls.'[13] He was of the firm opinion that progress could not be achieved without education. For this reason, he promoted and disseminated education and did various educational work.

Gender equality : According to this 5th goal, 'Gender equality is not only a fundamental human right, but a necessary foundation for a peaceful, prosperous and sustainable world.'[14] For this, it is very important to create gender equality and focus on empowering women. Dr. Ambedkar has also emphasized gender equality and put forward various ideas like equal education for women, equal opportunities, and equal pay.

Clean water and sanitation : The sixth Sustainable Development Goal states that 'access to safe water, sanitation, and hygiene is the most basic human need for health and well-being.'[15] Every person should have access to this basic need. The Sustainable Development Goals have made it clear that, despite the challenges, safe and affordable drinking water should be made available, infrastructure should be invested in, and sanitation education should be promoted. Rrecognizing that water is also a basic human need, Dr. Ambedkar led the Mahad Chavdar Talya Satyagraha to ensure equal rights for all to use public water sources, which highlighted fundamental human rights. Untouchables were prohibited from using water from public wells, public lakes, or other water sources. Dr. Ambedkar has tried to break this social inequality and ensure equal rights to water for all. Recognizing the importance of public health and clean living standards, he put forward a broad position that the welfare state should have a duty to provide these facilities to deprived and poor society.

Affordable and clean energy : 'Goal 7 is about ensuring access to clean and affordable enrgy, which is key to powering agriculture, business, communications, education, healthcare, and transportation.'[16]The goal of sustainable development in the context of affordable and clean energy Dr. Ambedkar's thoughts in this regard are similar. He had a strong stance that energy should be affordable, prioritizing the economic interests of the weaker and disadvantaged sections. His stance was based on social and economic equality. He gave more importance to the planned and multipurpose use of water resources. While considering various aspects such as energy generated from water resources, agriculture, industry, and shipping, he gave priority to social welfare and the inclusive use of energy.

Decent work and economic growth : 'Decent work means productive opportunities for everyone that deliver a fair income, workplace security, social protection for families, and robust prospects for personal development and social integration.'[17] However, this opportunity is lacking in society. Because various factors, such as a lack of good jobs, quality education and training, gender discrimination, and ethnicity, stand in the way of these opportunities. The eighth goal of sustainable development is to strive for this.Dr. Ambedkar supported industrialization to provide employment opportunities, reduce unemployment, and eliminate economic backwardness. Working hours were reduced to protect the rights of workers and their welfare. Workers' rest was taken care of. As a social security measure, the safety of workers was ensured by taking into account incidents such as illness and accidents. He opposed any social discrimination such as caste and religion at the workplace. Dr. Ambedkar prioritized the participation of all in economic development, proposing that inclusive and dignified employment should be created and that the government should provide such opportunities to improve the living standards of the weak and disadvantaged sections.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Industry, innovation and infrastructure: 'The objective of the ninth goal of sustainable development is to create resilient infrastructure, promote sustainable industrialization, and stimulate innovation.'[18] According to this, industrialization is given priority, infrastructure is given priority, and new initiatives are given priority. Transport, irrigation, energy, and information technology are given importance.Dr. Ambedkar gave importance to industrialization to reduce backwardness and poverty. He gave priority to infrastructure like roads, transport, electricity, water planning, irrigation, and communication. He gave importance to ensuring that infrastructure facilities are the same for all. Inclusiveness was a characteristic of his thoughts. Similarly, he supported the vision of scientific and technological progress. A characteristic of his thoughts was that he prioritized social justice along with economic development.

Reduce inequalities : 'Inequality threatens long-term social and economic development, hinders the process of poverty eradication, and reduces people's sense of satisfaction and self-esteem.'[19] In line with this goal of sustainable development, Dr. Ambedkar also opposed inequality. Inequality in Indian society is largely based on the caste system. Since the caste system is supported by religion, it is deeply rooted in society. Due to this, many inequalities are found in this society. Dr. Ambedkar opposed these inequalities and gave priority to equality. Equal opportunities and social justice were given importance. Social, political, and economic equality were given importance. In Indian society, the entire life of women is surrounded by inequality. To eliminate inequality, Dr. Ambedkar worked for the social rights of women. He worked to establish equality in society and spread social justice.

Peace, justice and strong institutions : 'Goal 16 is about promoting peaceful and inclusive societies, providing access to justice for all, and building effective, accountable, and inclusive institutions at all levels.'[20] People should not face any form of discrimination based on religion, gender, race, or any other factor in their lives. This theme emphasizes ensuring inclusive participation by strengthening the rule of law and promoting human rights. Dr. Ambedkar also repeatedly talked about the way to establish peace in society by giving importance to equality, brotherhood, and justice. He believed that peace would be created in society when everyone gets equal rights and equal opportunities. To achieve this, he gave importance to social justice. His idea of justice was not limited to social justice but also gave importance to economic and political justice. He gave importance to constitutional rules to ensure peace and social justice in society. He firmly believed that if all institutions functioned according to democratic rules, institutions could develop themselves and society effectively, and this was possible only in a democracy. He believed that in a democracy, every section of society would get justice.

The relevance of Dr. Ambedkar's thoughts in the contemporary context : His fundamental principles of equality, liberty, justice, and fraternity are emphasized to create an inclusive society. We see these fundamental principles embedded in the Constitution as well. Even after so many years since the Indian Constitution came into force, various challenges such as social inequality, economic inequality, caste discrimination, and imbalance in development persist. In such a situation, Dr. Ambedkar's thoughts on equal opportunities, education for all, social empowerment of all, and human dignity are still as important as ever. Dr. Ambedkar gave importance to democracy. He gave importance to the rule of law. He gave importance to the empowerment of institutions and their accountability. He also gave importance to the dignity, honor, and protection of every citizen's rights. Therefore, his thoughts serve as a guide for strengthening democracy, upholding constitutional values, protecting the rights of citizens, and for the overall development of society in today's times. When considered in the context of sustainable development, Dr. Ambedkar's thoughts are analogous to the goals of sustainable development. If sustainable development is to be achieved, it is possible to create an equitable, just, and inclusive society by keeping Dr. Ambedkar's thoughts in mind; therefore, Dr. Ambedkar's thoughts are as effective and useful today as they were then. Dr. Ambedkar's thoughts are still a guide for creating an egalitarian society.**Conclusions:** In the present research paper, when the goal of sustainable development and the thoughts of Dr. Ambedkar are studied, it is found that out of the 17 goals of sustainable development, Dr. Ambedkar's thoughts show similarity with 10 goals. The basic foundation of Dr. Ambedkar's thoughts seems to be based on equality, freedom, justice, fraternity, and education. This foundation is found to be equally strong for sustainable development. In sustainable development, priority is given to inclusive development and equal opportunities for all. Inclusion and equal opportunities also play a central role in Dr. Ambedkar's thinking. Like the Sustainable Development Goals, Dr. Ambedkar's thinking focuses on poverty eradication, good health and well-being of society, quality education, gender equality, clean water and sanitation, affordable and clean energy, decent

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

work and economic growth, industry, innovation and infrastructure, combating inequality, peace, justice and strong institutions. Therefore, even in contemporary times, Dr. Ambedkar's thoughts are still guiding and useful for the welfare of society, for eliminating inequality in society, establishing economic equality, and preserving human dignity.

Acknowledgement

I would like to express my sincere gratitude to all those who have supported and guided me in completing this research paper entitled "Building an Egalitarian Society and Sustainable Development: A Study of Dr. Ambedkar's Thoughts."I am deeply thankful to my academic institution and the Department of Ambedkar Thought for providing the necessary academic environment, encouragement, and resources for undertaking this study. I am especially grateful to my teachers, colleagues, and well-wishers for their valuable guidance, suggestions, and continuous support throughout the research

Abstract

*India's vision of **Viksit Bharat 2047** seeks to transform the country into a developed nation by the centenary of independence. Municipal corporations have a central role in this transformation because the quality of urban governance directly affects citizens' everyday lives, economic activity, environmental sustainability and social well-being. Rapid urbanisation, increasing demand for public services, climate-related risks and growing expectations for transparent administration have created a need for municipal institutions to adopt digital technologies. This paper examines the opportunities and challenges associated with the digital transformation of municipal corporations in India. It explores how technologies such as artificial intelligence, geographic information systems, cloud computing, digital payment systems, data analytics, Internet of Things applications and online citizen-service platforms can improve municipal administration. Particular attention is given to digital revenue collection, solid-waste management, water and sanitation services, urban planning, grievance redressal, traffic management and citizen participation. The paper argues that digital transformation should not be understood merely as the computerisation of existing municipal processes. Instead, it should involve institutional reform, data-driven decision-making, inclusive service delivery, employee capacity building, cybersecurity and sustainable urban development. At the same time, municipalities face challenges including inadequate digital infrastructure, financial constraints, shortage of skilled personnel, fragmented databases, cybersecurity risks, unequal access to technology and resistance to organisational change. The paper proposes a citizen-centric and sustainable digital governance framework through which municipal corporations can contribute meaningfully to the Viksit Bharat 2047 vision.*

Keywords: *Viksit Bharat 2047, Municipal Corporation, Digital Transformation, Artificial Intelligence, E-Governance, Smart Cities, Urban Governance, Sustainable Development, Digital Economy, Citizen Services*

Introduction

India is undergoing a significant urban transformation. Cities have become important centres of employment, commerce, innovation, education, infrastructure and economic activity. Municipal corporations are responsible for many of the services that determine the quality of urban life, including sanitation, waste management, roads, drainage, public health, water supply, building regulation, local taxation and maintenance of public spaces. At the same time, expectations regarding municipal services are changing. Citizens increasingly expect public services to be accessible through digital platforms, transactions to be transparent, complaints to be addressed quickly and government decisions to be supported by reliable information. These expectations create both an opportunity and a responsibility for municipal corporations to modernise their administrative systems.

Website: https://bnir.us

The Viksit Bharat 2047 vision provides a broader framework for considering this transformation. A developed India requires not only economic growth but also effective institutions, sustainable infrastructure, technological capability, social inclusion and responsive public administration. Municipal corporations are therefore important actors in translating national development objectives into improvements at the local level. Digital transformation can help municipal corporations move from reactive administration towards proactive and evidence-based governance. For example, data generated through municipal services can help authorities identify areas requiring waste collection, monitor water consumption, analyse traffic conditions, assess property-tax compliance and identify infrastructure deficiencies. However, technology alone cannot solve municipal governance problems. A municipality may introduce an online portal without improving the underlying administrative process. Similarly, an AI system may produce limited benefits if municipal data are incomplete or employees lack the skills to use the system effectively. Digital transformation must therefore be accompanied by institutional reform, capacity development, responsible data management and citizen inclusion. This research examines these opportunities and challenges and considers how municipal corporations can contribute to the achievement of Viksit Bharat 2047.

Statement of the Problem

Indian municipal corporations frequently operate under conditions of increasing service demand, limited financial resources, administrative complexity and rapidly changing urban requirements. Traditional paper-based and fragmented administrative processes can result in delays, duplication of work, limited coordination and difficulties in monitoring service delivery. Although digital technologies are increasingly being introduced into urban governance, the level and quality of digital transformation vary considerably among municipalities. Some corporations have developed online service portals, GIS systems, digital payment facilities, integrated command centres, mobile applications and technology-enabled monitoring mechanisms. Others continue to depend heavily on manual processes. The central problem is therefore not simply whether municipal corporations should adopt digital technologies, but **how digital transformation can be implemented in a manner that improves governance, promotes inclusion, protects citizens' data and contributes to sustainable urban development**.

Research Objectives

The study has the following objectives:

1. To examine the current significance of digital transformation in municipal governance in India.
2. To identify opportunities created by artificial intelligence and other emerging technologies for municipal service delivery.
3. To analyse the potential contribution of digital governance to transparency, accountability, efficiency and citizen participation.
4. To examine the major institutional, financial, technological and social challenges faced by municipal corporations.
5. To assess the relationship between digital municipal governance and sustainable urban development.
6. To propose a citizen-centric framework for strengthening municipal digital transformation in alignment with Viksit Bharat 2047.

Research Questions

The study addresses the following questions:

1. How can digital technologies transform municipal governance in India?
2. What opportunities can AI and data-driven systems create for municipal service delivery?
3. What are the major barriers to digital transformation in municipal corporations?
4. Can digital municipal governance improve transparency, efficiency and citizen satisfaction?
5. How can municipalities ensure that digital transformation remains inclusive and environmentally sustainable?
6. What policy and institutional measures are required to align municipal digital transformation with Viksit Bharat 2047?

Research Methodology

This study may be designed as a **descriptive and exploratory research study** based primarily on secondary information.

Research Approach

A qualitative and analytical approach can be used to examine the relationship between digital transformation and municipal governance.

Sources of Data

Secondary information may be collected from:

- Government reports and policy documents
- Municipal corporation publications
- Ministry and government programme reports
- Census and official statistical publications
- Academic journals and research papers
- Books and edited volumes
- Reports of international organisations

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

- Official digital-governance and urban-development portals

For an empirical version of the paper, primary data can additionally be collected from **municipal officials and urban residents** through questionnaires and interviews.

Suggested Sampling

If primary research is undertaken, respondents could be divided into two groups:

- Municipal officials/employees
- Citizens who use municipal services

A selected municipal corporation or a comparative study of two or more corporations could be used as the study area.

Data Analysis

Quantitative responses can be analysed using percentages, mean scores, cross-tabulation and correlation analysis. Qualitative responses can be analysed thematically to identify recurring issues concerning technology adoption, service quality, digital inclusion and institutional capacity.

Digital Transformation and Municipal Governance

Digital transformation represents a shift from conventional administrative processes towards technology-enabled systems in which information can be collected, shared, analysed and used for decision-making.

In municipal governance, this transformation can occur across several areas.

6.1 Digital Citizen Services

Online platforms can enable citizens to access services such as:

- Property-tax payment
- Birth and death certificates
- Trade licences
- Building permissions
- Water-related services
- Complaints and grievance registration
- Municipal fee payments

Such services can reduce physical visits to government offices and improve administrative convenience.

Artificial Intelligence

AI has the potential to support municipal decision-making by analysing large volumes of information. Possible applications include predicting waste-generation patterns, identifying infrastructure problems, analysing citizen complaints, detecting anomalies in revenue collection and supporting urban planning. However, AI should support—not replace—accountable human decision-making, particularly where municipal decisions affect citizens' rights or access to essential services.

Geographic Information Systems

GIS can integrate spatial information with municipal databases. This can assist authorities in mapping roads, drainage networks, public facilities, properties, waste-collection routes, water infrastructure and land-use patterns. GIS-based planning can help municipalities identify service gaps and allocate resources more effectively.

Digital Payments and Municipal Finance

Digital payment systems can make municipal transactions easier to monitor. Online collection of property taxes, licence fees, utility charges and other municipal revenues can potentially improve collection efficiency and reduce opportunities for manual errors or leakages. Stronger municipal digital-finance systems can therefore contribute to improved local fiscal capacity.

Opportunities for Municipal Corporations

Improved Service Delivery

Digital systems can reduce processing time and provide citizens with clearer information about the status of their applications and complaints.

Greater Transparency

Online publication of municipal information, service standards, budgets, tenders and project progress can strengthen public accountability.

Data-Driven Decision-Making

Municipalities generate substantial information through tax records, complaints, infrastructure systems, public-health services and environmental monitoring. Properly managed data can support evidence-based policy decisions.

Better Waste Management

Technology can assist municipalities in optimising collection routes, monitoring collection vehicles, identifying waste accumulation points and analysing waste-generation patterns.

Sustainable Resource Management

Digital monitoring can support efficient management of water, electricity, transportation, waste and other urban resources. This can contribute to environmental sustainability.

Citizen Participation

Mobile applications, online grievance platforms, digital surveys and participatory platforms can provide citizens with additional channels to communicate with municipal authorities.

Support for the Digital Economy

Efficient digital municipal systems can reduce administrative barriers for businesses. Faster licensing, online approvals, digital payments and

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

transparent processes can improve the local business environment.

Major Challenges

Digital Infrastructure Gaps
Reliable connectivity, hardware, cloud infrastructure and interoperable software are necessary for effective digital municipal governance. Infrastructure limitations can restrict adoption, particularly in smaller urban bodies.

Financial Constraints
Digital transformation requires initial investment as well as continuing expenditure for software, hardware, maintenance, cybersecurity, training and system upgrades.

Shortage of Skilled Personnel
Technology cannot produce sustainable results without people who understand both municipal administration and digital systems. Municipal corporations therefore require continuous training in data management, cybersecurity, AI, GIS and digital service delivery.

Data Fragmentation
Municipal departments often maintain separate databases and software systems. Lack of interoperability can prevent information from being integrated across departments.

Cybersecurity and Privacy
As municipalities increasingly store personal and financial information digitally, cybersecurity becomes a major governance issue. Strong security practices, access controls, responsible data management and compliance with applicable data-protection requirements are essential.

Digital Exclusion
Not every citizen has equal access to smartphones, internet connectivity, digital literacy, or online payment facilities. A fully digital municipal system could unintentionally exclude vulnerable groups if offline alternatives are removed.

Resistance to Organisational Change
Employees accustomed to established procedures may find new technologies difficult to adopt. Digital transformation therefore requires organisational change management rather than simply purchasing new technology.

Digital Transformation and Sustainable Development

The digital transformation of municipal corporations should be connected with sustainability rather than treated as a purely technological exercise. For example, digital monitoring can help municipalities improve waste collection and recycling, detect water losses, monitor air quality, optimise street lighting, improve public transportation and support climate-risk management. Data-driven urban planning can also help authorities understand the relationship between population growth, infrastructure, land use, transportation and environmental pressure. The objective should therefore be to create smart and sustainable municipalities, rather than cities that are merely technologically advanced.

Proposed Framework for Viksit Bharat 2047
A municipal digital-transformation framework for Viksit Bharat 2047 can be based on six interconnected pillars:
Pillar 1: Digital Infrastructure
Municipal corporations should establish reliable digital infrastructure, interoperable databases, secure cloud systems and appropriate connectivity.

Pillar 2: Intelligent Governance
AI, GIS, data analytics and automation should be used where they can produce measurable improvements in decision-making and service delivery.

Pillar 3: Citizen-Centric Services
Digital services should be designed around citizens' needs, with simple interfaces, multilingual accessibility, grievance mechanisms and clear service timelines.
Pillar 4: Institutional Capacity
Municipal employees should receive continuous training, while municipalities should develop dedicated digital-governance capabilities.

Pillar 5: Trust, Security and Accountability
Digital transformation should incorporate cybersecurity, privacy protection, transparent algorithms where applicable audit mechanismsand clear institutional responsibility.
Pillar 6: Sustainability and Inclusion
Technology adoption should support environmental objectives while ensuring that digitally disadvantaged citizens continue to have access to essential municipal services.

Expected Outcomes
Effective digital transformation of municipal corporations could produce several outcomes:

- Faster and more accessible public services
- Improved municipal revenue collection
- Greater administrative transparency
- Better monitoring of public infrastructure
- More efficient waste and water management
- Improved citizen grievance resolution
- Evidence-based urban planning
- Greater opportunities for citizen participation
- Improved support for local businesses
- Stronger environmental monitoring

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

- Better preparedness for climate and urban risks

However, these outcomes depend on implementation quality. Technology adoption should therefore be measured by **actual improvements in governance and citizen welfare**, rather than by the number of digital platforms introduced.

Policy Recommendations

The study proposes the following recommendations:

1. **Develop integrated municipal digital platforms** rather than maintaining isolated departmental systems.
2. **Strengthen municipal data governance** through common standards, interoperability, quality controls and responsible data practices.
3. **Invest in employee training** in AI, GIS, cybersecurity, data analytics and digital administration.
4. **Adopt citizen-first design** so that digital services are simple, accessible, multilingual and usable by people with different levels of digital literacy.
5. **Maintain assisted/offline channels** for citizens who cannot access digital services independently.
6. **Strengthen cybersecurity** through regular audits, employee awareness, access controls, incident-response systems and secure infrastructure.
7. **Use AI responsibly**, with human oversight and mechanisms for identifying and correcting errors or biases.
8. **Link digital projects with sustainability indicators**, including waste reduction, water efficiency, energy efficiency and climate resilience.
9. **Encourage public-private and academic partnerships** where appropriate, while maintaining public accountability over municipal data and services.
10. **Evaluate digital projects based on outcomes**, including service delivery time, cost efficiency, citizen satisfaction, transparency and environmental impact.

Conclusion

Digital transformation offers municipal corporations an important opportunity to contribute to India's development journey towards Viksit Bharat 2047. Municipal institutions operate at the level where national development objectives become visible in citizens' everyday experiences. Better waste management, efficient water services, transparent taxation, responsive grievance redressal, effective urban planning and sustainable infrastructure are therefore essential components of a developed India. Artificial intelligence, GIS, data analytics, digital payments, cloud systems and other technologies can strengthen these functions. Nevertheless, digitalisation should not be treated as an end in itself. Without institutional capacity, adequate resources, reliable data, cybersecurity, employee training and citizen inclusion, technology may simply digitise existing weaknesses.The future of municipal governance should consequently be based on a **people-centred, secure, inclusive, data-driven and sustainable model of digital transformation**. Municipal corporations that successfully combine technological innovation with institutional reform can become important engines of urban development and contribute substantially to the broader Viksit Bharat 2047 vision.

Acknowledgement

I would like to express my sincere gratitude to all those who have contributed directly or indirectly to the completion of this research paper entitled "Digital Transformation of Municipal Corporations in India: Opportunities and Challenges for Achieving the Viksit Bharat 2047 Vision."I am deeply thankful to my institution and the Department of Commerce and Management for providing a supportive academic environment and the necessary encouragement to undertake this study. I express my heartfelt appreciation to my teachers, colleagues, and well-wishers for their valuable guidance, suggestions, and continuous support throughout the research process.

Abstract
Innovation drives entrepreneurship, technological progress and economic growth. For technology-based start-ups, patent protection helps transform innovative ideas into viable businesses by safeguarding inventions and facilitating investment, licensing, technology transfer and market expansion. This paper examines how patent law supports entrepreneurship and start-ups in India, focusing on the Patents Act, 1970, National IPR Policy, 2016, Start-up India and SIPP. It highlights challenges such as costs, limited awareness, procedural complexities and commercialization gaps. The study concludes that patents can promote innovation and competitiveness, but their success depends on broader support through finance, incubation, technology transfer and effective enforcement.

Keywords: *Patent Law, Entrepreneurship, Start-ups, Innovation, Intellectual Property Rights, Commercialization, Technology Transfer, Start-up India, SIPP.*

Introduction

The modern economy is increasingly driven by knowledge, technology and innovation, making intellectual assets vital to entrepreneurship. Start-ups often rely on innovative technologies but face risks of imitation and unauthorized use. Patent law protects qualifying inventions through exclusive rights, helping start-ups gain competitive advantage, attract investment, facilitate licensing and enhance business value. In India, the Patents Act, 1970, Patents Rules, 2003, National IPR Policy, 2016, Start-up India and SIPP support an innovation-friendly environment. The key concern is whether patent protection effectively converts inventions into successful enterprises**.**

Objectives and Methodology

The study aims to:

1. Examine the relationship between patent law, innovation and entrepreneurship.
2. Analyse the role of patents in technology-based entrepreneurship.
3. Examine the role of patents in commercialization and technology transfer
4. Examine
5. India's patent framework and start-up facilitation measures.
6. Suggest measures to strengthen India's patent ecosystem. The study adopts a **doctrinal and qualitative methodology** and relies primarily on secondary sources, including legislation, government policies, official reports, judicial decisions and relevant literature.

Patent Law and Entrepreneurship

Patent protection encourages entrepreneurs to invest in R&D by enabling them to recover innovation costs through commercial exploitation.

Website: https://bnir.us

In India, patents are generally granted for inventions that meet the requirements of novelty, inventive step, and industrial applicability, subject to statutory exclusions. For start-ups, patents can provide competitive advantage, attract investors, support licensing and technology transfer, and enhance the value of intangible assets. However, a patent alone does not guarantee commercial success; market demand, enforceability, business strategy, and effective commercialization are equally important.The entrepreneurial innovation cycle can be summarized as: R&D → Innovation → Patent Protection → Investment → Commercialization → Enterprise Growth → Further Innovation

Indian Legal and Policy Framework

The Patents Act, 1970 and Patents Rules, 2003 form the core of India's patent framework, governing filing, examination, grant, opposition, licensing, revocation, and infringement remedies. The framework balances inventor rights with public interest, technology access, and competition. The National IPR Policy, 2016 strengthens the broader IP ecosystem by promoting awareness, innovation, commercialization, effective administration and enforcement, and skill development. It recognizes IPR as an important tool for innovation, entrepreneurship, and economic growth**.**

Start-up India, SIPP and Patent Facilitation

The Start-up India initiative recognizes IPR as a key asset for innovative enterprises and aims to reduce the cost and time involved in obtaining protection. The SIPP scheme provides start-ups with facilitators for patent, design, and trademark applications, helping overcome financial and technical barriers. Eligible start-ups can also obtain expedited patent examination under Rule 24C, enabling faster investment, market entry, and commercialization. Patent fee concessions, including an 80% reduction for eligible start-ups compared with corporates, further improve access to patent protection.

Patents, Investment and Commercialization

Patents can attract investment by demonstrating proprietary technology, strengthening investor confidence, improving bargaining power, and enabling licensing and partnerships. Patent commercialization may involve:

Direct commercialization – producing and selling patented products.

Licensing – granting usage rights for royalties.

Assignment – transferring patent ownership.

Joint ventures – partnering with established businesses.Technology transfer – moving innovations from research institutions to industry.The basic relationship is:Patent → Technology → Commercialization → Revenue Thus, the value of a patent depends largely on its effective commercialization and utilization.

Role of Universities and Incubators

Universities are key sources of innovation, but academic inventions often need institutional support to reach the market. Strengthening IPR cells, technology-transfer offices, incubators, entrepreneurship centres, and industry partnerships can bridge this gap. Incubators support start-ups through IP strategy, patent protection, mentoring, finance, business planning, and market access. Integrating research, IPR, incubation, finance, and industry can effectively transform innovation into enterprise.

Emerging and Sustainable Technologies

Emerging technologies such as AI, biotechnology, green technology, and deep technology pose new challenges for patent law, particularly regarding AI-assisted inventions, inventorship, and patentability. Patents can promote sustainable entrepreneurship in areas such as renewable energy, energy efficiency, and climate technology. However, patent protection must be balanced with affordability, competition, public access, and public interest.

Challenges Faced by Start-ups

Despite government support, start-ups face several patent-related challenges, including:1.High costs of patent filing and prosecution.2.Limited IP awareness among entrepreneurs.

3.Technical and legal complexity in patent drafting.

4.Premature disclosure, which may affect patentability.

5.High enforcement costs, especially litigation.

6.Costly international protection across multiple jurisdictions.

7.Commercialization challenges, as patents do not guarantee market success.

These challenges highlight the need for a stronger and integrated entrepreneurial support ecosystem.

Critical Analysis

Patent policy should be assessed not only by the number of applications or grants but through three stages: Patent Creation → Utilization → CommercializationCreation protects inventions, utilization supports investment, licensing, and partnerships, while commercialization generates products, revenue, employment, and further innovation.For entrepreneurship, India should focus on quality, effective utilization, and commercialization rather than merely increasing patent filings. Enforcement should also balance patent rights with public interest, affordability, access, and competition, particularly in essential

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

sectors such as healthcare and pharmaceuticals.

Findings

The study finds that patent protection promotes R&D, strengthens start-up competitiveness, and supports investment, licensing, and technology transfer. India's legal framework, along with Start-up India and SIPP, has reduced financial and procedural barriers through fee concessions and expedited examination. However, limited IP awareness, commercialization challenges, and enforcement costs remain significant concerns. Universities and incubators are vital in linking research with entrepreneurship. Patent policy must also adapt to emerging technologies while balancing innovation incentives with public interest, access, and competition.

Conclusion

Patent law helps transform innovation into entrepreneurship by protecting inventions, encouraging R&D, and supporting commercialization. India's Patents Act, 1970, National IPR Policy, 2016, Start-up India, and SIPP have improved access to IP protection for start-ups. However, patents alone do not ensure business success. Finance, incubation, expertise, market access, skilled talent, and effective enforcement are equally important. India should therefore shift from patent creation to effective utilization and commercialization.

Recommendations

1. The following measures can strengthen patent-driven entrepreneurship in India:
2. Enhance IP education through practical training on patent searches, confidentiality, and IP strategy..Integrate IP support into incubators by providing access to patent experts.
3. Strengthen university technology transfer to connect research with industry and markets.
4. Prioritize commercialization rather than focusing only on patent filings.
5. Improve IP-based financing by enabling better valuation of intangible assets.
6. Ensure affordable professional support for patent filing and technical assistance.
7. .Support international patenting through guidance on global filing strategies.
8. .Improve dispute resolution to reduce costs and delays.
9. Promote green innovation through supportive patent policies.
10. Conduct regular IP audits to identify and protect valuable intellectual assets.

Abstract

The production and dissemination of digital content have been profoundly changed by artificial intelligence (AI); however, the quick advancement of generative AI has also brought up substantial problems due to the rise of deepfakes and digital impersonation. AI-generated or altered sounds, photos, and videos that can accurately depict a person saying or doing something that never happened are known as "deepfakes." A person's reputation, privacy, dignity, liberty, and digital identity can all be seriously harmed by their misuse. When deepfakes are exploited for financial fraud, political disinformation, sexual exploitation, identity theft, defamation, or non-consensual personal imagery, the issue becomes especially severe. With a focus on the Information Technology (Intermediary Guidelines and Digital Media Ethics Code) Rules, 2021, as revised in 2026,[i] this study investigates the legal framework controlling AI deepfakes and digital impersonation in India. The term "synthetically generated information" is introduced in the 2026 amendments, which also place extra requirements on intermediaries to recognize, label, control, and stop illegal synthetic material. The Information Technology Act of 2000, the Bharatiya Nyaya Sanhita of 2023, constitutional safeguards under Articles 19 and 21, and the growing legal acknowledgment of privacy, dignity, reputation, and digital identity are all examined in the study. The study also looks into victim remedies, intermediary liability, the conflict between regulation and free speech and expression, technological issues in identifying deepfakes, and evidential challenges. It contends that while the 2026 IT Rules are a huge step forward in India's reaction to harmful content produced by AI, there are still a lot of loopholes in terms of enforcement, attribution of culpability, cross-border distribution, quick removal, and protection from overregulation. A fair, rights-based, and technologically aware strategy that safeguards people from digital impersonation while maintaining acceptable applications of AI, such as satire, journalism, education, creativity, and creative expression, is suggested in the study's conclusion.

Keywords: -*AI Deepfakes, Digital Impersonation, Right to Privacy, Reputation, IT Rules, 2026*

Introduction of the study

Artificial intelligence has significantly changed how information is generated and shared. Generative AI technologies can now create incredibly lifelike images, videos, audio recordings, and other audiovisual content without requiring extensive technical skills. Although these advancements offer considerable social and economic advantages, they have also led to a situation where distinguishing between genuine and false information is becoming more challenging. One of the most notable examples of this technological advancement is deepfakes. A deepfake can mimic a person's voice, face, gestures, and facial expressions while putting them in a made-up setting. Ordinary viewers may perceive the outcome as authentic enough to accept it as such. Therefore, the harm is not restricted to the content's untruth; rather, it results from synthetic media's capacity to alter a real person's identity and perceived behavior. Digital platforms are now essential to public communication, political discourse, commerce, entertainment, and interpersonal connections; the legal significance of deepfakes is especially significant in India. It is possible to trick a family member into sending money by using a cloned voice. Intimate image manipulation can have serious negative effects on one's social, professional, and psychological well-being.

Quick Response Code:

Website: https://bnir.us

As a result, the issue is multifaceted. Deepfakes may concurrently affect intellectual property, evidence law, criminal law, privacy law, defamation law, intermediary regulation, and constitutional rights. In the past, India's answer has depended on clauses that weren't created especially for generative AI. Identity theft, personation cheating, privacy violations, and obscene or sexually explicit electronic content are all covered by the Information Technology Act, 2000. [ii]The BNS has laws pertaining to defamation, personation, and cheating. [iii]Additionally, freedom of speech, privacy, dignity, and individual liberty are safeguarded by constitutional law.The 2026 modifications to the IT Rules brought about a substantial shift in the regulatory environment. The amendments introduced "synthetically generated information," which broadly refers to audio, visual, and audiovisual content that is artificially or algorithmically created, generated, modified, or altered so that it appears real, authentic, or true and depicts a person or real-world event in a way that may be indistinguishable from reality. Therefore, the revisions acknowledge that the primary legal issue is not just "fake news" but also digitally generated content that might mimic people or events.[iv] In order to uphold India's constitutional commitment to freedom of speech and technological innovation, this study investigates whether this legal framework is sufficient to address the harms produced by AI deepfakes and digital impersonation.

Research Problem

1. Deepfakes can seriously harm a person's privacy, dignity, reputation and identity.
2. Existing Indian laws do not fully address the unique challenges created by AI-generated content.
3. The IT Rules, 2026 introduce new safeguards for synthetically generated information.
4. The study examines whether these laws effectively protect victims while preserving freedom of expression.

Research Objectives

1. To examine the legal framework regulating AI deepfakes in India.
2. To analyses their impact on privacy, dignity, reputation and digital identity.
3. To assess intermediary liability under the IT Rules, 2026.
4. To identify legal gaps and suggest effective remedies for victims.

Comprehending Digital Impersonation and Deepfakes

In general, deepfakes can be defined as digitally produced or altered audio, visual, or audio-visual content that gives the impression of authenticity. Face swapping, voice cloning, lip synchronization, synthetic avatars, and the creation of completely manufactured people and events are a few examples. The concept of digital impersonation is more expansive. It happens when someone's identity, traits, or identifying information are utilized to represent them without their permission or authority. Thus, one technologically advanced type of digital impersonation could be considered deepfakes. A username or account password are not the only components of digital identification. In today's modern context, identity can be represented via images, facial features, voice patterns, biometric data, social media profiles, signatures, professional information, and other digital identifiers. Digital impersonation happens when someone purposefully assumes, replicates, or manipulates another person's identity or identifying qualities in order to deceive, mislead, gain an advantage, do harm, or create a false representation.

Privacy, dignity, and bodily autonomy

Privacy is one of the most pressing legal issues surrounding deepfakes. A person's photograph, voice, or likeness may be obtained from publically available sources and modified without their permission. The Supreme Court's ruling in Justice K.S. Puttaswamy (Retd.) v. Union of India[v] established privacy as a basic constitutional right. Privacy is associated with autonomy, dignity, and control over intimate areas of life. This principle holds great significance for deepfake. This results in a particularly serious type of violation since the individual loses control over the digital image of his or her body and personality.

Information Technology Rules for 2026 and Synthetically Generated Information

One of the most significant developments in India's legal response to deepfakes is the revision of the Information Technology (Intermediary Guidelines and Digital Media Ethics Code) Rules. The Information Technology (Intermediary Guidelines and Digital Media Ethics Code) Amendment Rules, 2026, notified by G.S.R. 120(E) dated 10 February 2026, included explicit measures addressing synthetically generated information. The amendments went into effect on February 20, 2026.The significance of the change stems from the fact that intermediary regulation now expressly recognizes the phenomena of AI-generated or altered synthetic media rather than addressing it just through generic illegal-content rules. The Rules define "synthetically generated information" broadly to include audio, visual, or audio-visual content created, generated, modified, or altered

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

using computer resources in such a way that it appears real, authentic, or true and may be perceived as representing a natural person or real-world event. This definition is particularly applicable to deepfakes. The regulatory worry is not merely whether AI was employed, but whether synthetic information might deceive people about the legitimacy of a person or event. The Information Technology Act of 2000 has multiple clauses that can handle various types of deepfake-related misconduct. Section 66C targets identity theft, whereas Section 66D addresses cheating by personation via a communication device or computer resource, making it applicable to AI-enabled voice cloning and impersonation fraud. Section 66E protects against some abuses of bodily privacy, whereas Sections 67 and 67A may apply if the deepfake material is offensive or sexually explicit. Thus, although the IT Act does not contain a unique offense labelled "deepfake," its current laws can address numerous detrimental repercussions of AI-generated impersonation.

Bharatiya Nyaya Sanhita (2023)

The Bharatiya Nyaya Sanhita, 2023 (BNS) may also apply to deepfake actions, depending on the nature, motive, and repercussions of the behaviour. Deepfakes can aid in cheating, personation, forgeries, intimidation, sexual exploitation, financial fraud, and reputational injury. Section 356[vi], relating to defamation, is especially important when false audio-visual or other representations impair a person's reputation. As a result, criminal culpability should be established by the underlying unlawful action, intention, knowledge, deceit, and subsequent injury, rather than the employment of AI technology itself.

Suggetions

Recognize digital personality rights** to safeguard a person's face, voice, name, image, and likeness against unauthorized use.

Establish a specific deepfake framework** to define harmful synthetic content and provide appropriate civil and criminal sanctions.

Strengthen provenance and labelling** to distinguish between AI-generated or altered information.

Provide prompt victim redress** through easily accessible and time-bound grievance and takedown procedures.

Obtain recompense for significant harm to reputation, privacy, dignity, and financial interests.
Preserve digital evidence such as metadata, source information, and records that are needed for an inquiry.

Protect legitimate expression such as satire, parody, journalism, education, research, and artistic innovation.

Give police, judges, lawyers, prosecutors, and forensic professionals specialized training on AI-generated evidence.

Promote digital literacy so that citizens can detect and verify questionable AI-generated information.

Increase international cooperation for investigating and prosecuting cross-border deepfake crimes.

Conclusion

AI deepfakes and digital impersonation pose a substantial threat to the interaction between technology, personal identity, and the law. Artificial intelligence's ability to accurately recreate a person's face, voice, picture, gestures, and behaviour might have major consequences for reputation, privacy, dignity, liberty, autonomy, and digital identity. Deepfakes can be used to commit financial fraud, defamation, political misinformation, sexual exploitation, identity theft, and non-consensual intimate images. The Information Technology Rules, 2026, are thus a crucial step forward in India's legislative response, notably in terms of the acknowledgment of synthetically generated information and increased intermediary obligations for identification, labelling, prevention, and due diligence. However, IT Rules alone cannot give a comprehensive answer. Effective protection necessitates the coordinated implementation of the Information Technology Act, 2000, Bharatiya Nyaya Sanhita, 2023, constitutional safeguards under Articles 19 and 21, data-protection principles, personality rights, and civil and criminal remedies. At the same time, regulation should not limit legitimate uses of AI in journalism, satire, education, research, cinema, art, and creative expression. India requires a legal framework that is balanced, proportionate, victim-cantered, and technologically informed, combining stronger intermediary accountability, effective detection and labelling, rapid grievance redressal, evidence preservation, compensation, digital literacy, and international cooperation. Finally, the law must ensure that technological innovation does not become a tool for undermining an individual's identity, while also protecting the right to utilize AI responsibly for creative and societal growth.

Acknowledgement

I would like to express my sincere gratitude to all those who supported and encouraged me in completing this research paper entitled **"From** Innovation to Enterprise: The Role of Patent Law in Promoting Entrepreneurship and Start-ups in India."

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

I am deeply thankful to my institution, colleagues, and well-wishers for their valuable support, guidance, and encouragement throughout the course of this research. I also acknowledge the contribution of the various legislative, governmental, and academic sources that provided the necessary information and helped me develop a better understanding of patent law, intellectual property rights, innovation, and entrepreneurship in India.

Financial support and sponsorship

Abstract

Climate change is creating serious problems for agriculture by increasing drought, soil salinity, and extreme temperatures. These stresses affect plant growth, development, crop yield, and global food security. Traditional methods used to study plant responses to stress are often time-consuming, labour-intensive, and difficult to use for large numbers of plants. Artificial intelligence (AI) is becoming an important tool for studying and predicting plant responses to changing environmental conditions. AI can analyse large amounts of data collected through plant phenotyping, remote sensing, environmental sensors, and molecular studies. This review focuses on recent AI approaches used to predict plant responses to drought, salinity, and temperature stress from 2016 to 2026. Machine learning, deep learning, computer vision, thermal imaging, and hyperspectral imaging can help in early detection and prediction of plant stress. Recent developments are moving beyond simple stress identification towards predicting crop performance and stress tolerance. The combination of AI with high-throughput phenotyping and multi-omics can help identify stress-tolerant crop varieties and support climate-resilient breeding. However, challenges related to data quality, limited field validation, unclear model predictions, and poor performance across different environments still remain. Future research should develop reliable and explainable AI models for sustainable agriculture and improved crop production under climate change.

Keywords: *Artificial intelligence, Climate resilience, Abiotic stress, Plant phenotyping, Sustainable agriculture, Machine learning*

Introduction

Agricultural production is increasingly affected by drought, soil salinity and extreme temperatures. These abiotic stresses disturb plant water relations, photosynthesis, membrane stability, nutrient uptake, metabolism and reproductive development, resulting in reduced growth and yield. Their effects become more complex when multiple stresses occur together or vary across locations and developmental stages (Zandalinas et al., 2020). Traditional plant-stress assessment involves morphological, physiological, biochemical and molecular measurements, including relative water content, chlorophyll content, photosynthetic efficiency, electrolyte leakage, ion accumulation and antioxidant activity. Although these measurements provide valuable information, they are often labour-intensive and may require destructive sampling. Consequently, rapid evaluation of large numbers of plants and genotypes under field conditions remains difficult (Singh et al., 2018; Sharma et al., 2026). Artificial intelligence (AI) has emerged as an important tool for analysing complex biological and environmental datasets. Machine learning (ML) identifies relationships among variables, whereas deep learning (DL) can automatically extract features from images and high-dimensional data.

Quick Response Code:

Website: https://bnir.us

AI is increasingly combined with RGB, thermal and hyperspectral imaging, remote sensing, Internet of Things (IoT) sensors and multi-omics information for rapid and non-destructive plant-stress assessment (Kamilaris and Prenafeta-Boldú, 2018) Recent research is moving beyond simple stress identification towards predictive phenotyping, crop-performance estimation and decision support. Multimodal AI systems that combine different sensing methods can improve the assessment of complex plant responses, while AI-assisted breeding may help prioritize stress-tolerant genotypes (Patil et al., 2026; Aggarwal et al., 2026). However, reliable application requires standardized datasets, field validation and biologically meaningful interpretation (Tsaftaris and Scharr, 2019). AI can integrate environmental information, such as temperature, humidity, rainfall, soil moisture and electrical conductivity, with plant data obtained from imaging, physiological measurements, biochemical traits, genomic information and yield records. Algorithms including Random Forest, Support Vector Machines, Artificial Neural Networks, Convolutional Neural Networks and transformers can be used for stress classification, severity estimation, tolerance prediction and crop-performance forecasting (Kamilaris and Prenafeta-Boldú, 2018, Patil et al., 2026).The major advantage of AI is its ability to model complex and nonlinear relationships among genotype, phenotype and environment. This is particularly important for climate-resilient agriculture because plant performance depends on interactions among stress intensity, developmental stage, genotype and management conditions. AI-based integration of phenotypic and molecular data may therefore support improved genotype selection and stress-tolerance prediction (Zandalinas et al., 2020, Aggarwal et al., 2026).

Material and Methods-

The present study was designed as a critical narrative review of research on artificial intelligence and plant responses to major climate-associated abiotic stresses. The review focused on drought, salinity and temperature stress, with emphasis on AI-assisted plant phenotyping and predictive agriculture. Scientific literature published between 2016 and 2026 was examined to identify recent developments, emerging applications, research gaps and future opportunities in this field.

Objectives of the study are-

- To review the evolution of AI applications in plant abiotic-stress research from 2016 to 2026.
- To evaluate AI approaches for predicting drought, salinity and temperature responses.
- To examine emerging multimodal AI and high-throughput phenotyping systems.
- To discuss the integration of AI with multi-omics and climate-resilient crop breeding.
- To identify major limitations and research gaps.
- To propose future directions for AI-assisted sustainable agriculture.

Results and Discussion

Evolution of AI in plant abiotic-stress research:

The use of Artificial Intelligence in plant science has expanded substantially over the last decade. Early investigations mainly used in supervising machine-learning algorithms, such as Random Forest, Support Vector Machines, decision trees and Artificial Neural Networks, for classification and prediction based on manually selected plant traits. The development of deep learning improved this process by allowing computers to extract relevant features directly from plant images. Convolutional Neural Networks became especially useful for image classification, plant segmentation and the identification of visible stress symptoms (Singh et al., 2018; Tsaftaris and Scharr, 2019). Recent research has moved towards multimodal AI, transformer-based models, hyperspectral analysis, remote sensing, AI-assisted multi-omics, foundation models, vision-language models, edge AI and digital agricultural systems (Table 1). AI is increasingly being combined with hyperspectral cameras, thermal sensors, Internet of Things devices, wearable plant sensors, drones and satellite platforms. These technologies support the development of multimodal data fusion, digital twins and AI-assisted crop breeding (Sharma et al., 2026). This development represents a gradual shift from observing stress symptoms to detecting, classifying, quantifying and predicting plant responses. The final stage involves decision support for irrigation, crop management and the selection of stress-tolerant genotypes (Fig.1)

Stage	Key components	Expected output
Stress characterization	Drought, salinity, heat and combined stresses	Defined stress conditions and plant response indicators
Data collection	Imaging, sensors, environmental data and omics	Integrated multi-source dataset
Data processing	Quality control, normalization, feature extraction and data fusion	AI-ready dataset
AI modelling	ML, DL, multimodal AI and emerging foundation models	Predictive models of plant stress response
Validation	Controlled experiments, field trials and external datasets	Reliable and transferable predictions
Breeding and management	Genotype prioritization and precision management	Climate-resilient varieties and improved resource use
Sustainable outcomes	Reduced losses, efficient water/resource use and resilient production	Sustainable and climate-resilient agriculture

AI for predicting drought stress

Drought is a major environmental limitation that reduces crop productivity by affecting stomatal activity, photosynthesis, cell expansion, nutrient movement and reproductive development. AI-based drought prediction can combine soil moisture, weather conditions, evapotranspiration, vegetation indices, canopy temperature, thermal signals, UAV images, satellite observations, morphological traits and yield-related information (Table 2)**.**Machine-learning methods, including Random Forest, Gradient Boosting and Support Vector Machines, are increasingly used with deep-learning models such as Convolutional Neural Networks and Long Short-Term Memory networks to predict crop performance under water-limited conditions. Recent research emphasizes that drought prediction should support irrigation and water-management decisions rather than remain limited to stress classification (Agricultural Water Management, 2026). The integration of environmental, physiological and remote-sensing data can improve the early identification of drought responses and support more efficient water use (Fig. 2).

Image-based drought phenotyping

Drought stress produces several visible changes, including leaf rolling, wilting, reduced leaf expansion, canopy colour variation, altered plant architecture and lower biomass accumulation.AI-based image analysis can quickly and consistently measure these traits, reducing errors and subjectivity in manual scoring.

Leaf wilting is receiving increasing attention because it reflects changes in plant water relations and can be monitored through images, drones and machine-learning systems. Recent research has highlighted the value of automated wilting assessment for large-scale screening of heat and drought-stressed crops (Vennam et al., 2026).

Emerging drought prediction

Recent studies are integrating multi-omics, machine learning and single-cell technologies to investigate the molecular basis of drought resilience. These approaches may help identify molecular signatures linked with water use efficiency, stress adaptation and recovery (Table 3)**.**

AI can therefore support drought research beyond visible symptoms by connecting molecular responses with physiological traits and whole plant performance.

AI for predicting salinity stress

Salinity is an important agricultural problem, particularly in irrigated, arid and coastal regions. Excess salts cause osmotic stress, ion toxicity, nutrient imbalance and disturbances in cellular metabolism. Traditional salinity assessment commonly includes measurements of sodium concentration, potassium concentration, the sodium to potassium ratio, chlorophyll content, photosynthesis, relative water content, biomass and antioxidant activity. AI can combine these physiological measurements with spectral, imaging and environmental information to provide a more comprehensive assessment of salt-stress responses (Table 3).Recent studies have combined AI with multi-omics, high-throughput phenotyping, satellite observations and hyperspectral imaging to investigate salinity tolerance. Transformer based and sequence based models may further assist in analysing molecular responses associated with salt adaptation (Artificial Intelligence in plant salt stress research, 2026). AI-based salinity models may be used to estimate stress severity, identify tolerant genotypes, detect soil salinization, predict biomass and yield, integrate physiological and omics data, and support salt-tolerance breeding.However, many salinity related AI models have limited external validation. Their practical use requires standardized metadata, independent datasets and confirmation through physiological experiments. AI predictions should therefore be interpreted together with established mechanisms of salt tolerance rather than treated as direct evidence of biological causation (Table 5).

AI for Predicting Temperature Stress

Increasing temperatures and frequent heat events pose serious risks to crop productivity. Heat stress affects photosynthesis, protein stability, membrane structure, reproductive development and grain or fruit formation (Table 3).AI-assisted temperature stress prediction can integrate air temperature, canopy temperature, relative humidity, vapour pressure deficit, thermal images, chlorophyll fluorescence, growth traits and reproductive performance.The use of these datasets can improve the identification of heat- sensitive and heat-tolerant plants under field and controlled environment conditions. Recent research emphasizes the importance of sensors, remote sensing and advanced phenotyping for studying plant responses to heat stress (Heat Stress Phenotyping, 2025).

Thermal Imaging and AI

Thermal imaging provides a non-destructive method for measuring canopy temperature. Water-stressed plants may show changes in transpiration and leaf temperature, making thermal signals useful for detecting stress.AI can analyse thermal images to detect early temperature changes in plants, even before visible signs of stress appear.

Multimodal AI-An Emerging Approach

Multimodal AI is an important recent development in plant-stress research. Unlike traditional systems that depend on a single data source, multimodal models combine information from images, sensors and physiological measurements.Plant stress is a complex biological response, and one type of data may not fully represent its development. Multimodal AI can therefore combine RGB images, thermal images, hyperspectral data, environmental measurements and physiological traits (Table 3). A 2026 study demonstrated the potential of multimodal AI for classifying stress responses across different plant species (Patil et al., 2026). The integration of different data types may improve stress detection, distinguish between similar symptoms and support the prediction of plant responses under changing environmental conditions (Fig.1). The main challenge is the lack of large, standardized datasets with clear biological information. Differences in plant species, growth stages, sensor types and environmental conditions can reduce model reliability.

AI and High-Throughput Plant Phenotyping

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

High-throughput phenotyping is one of the most promising applications of AI in climate-resilient crop research. AI can automatically measure plant height, leaf area, canopy cover, growth rate, biomass, leaf angle, wilting, leaf colour, canopy temperature and spectral characteristics (Table 1).The use of drones, hyperspectral cameras and remote-sensing platforms allows plant responses to be monitored at multiple levels, from individual leaves and plants to plots, fields and landscapes. AI-assisted digital phenotyping provides a connection between plant genotype and environmental performance. It can accelerate the screening of large plant populations and help identify traits associated with drought, salinity and temperature tolerance (Aggarwal et al., 2026).

AI, Multi-Omics and Climate-Resilient Crop Breeding

Climate resilience depends on interactions among genes, regulatory networks, proteins, metabolites and plant phenotypes. Multi-omics technologies generate large datasets from genomics, transcriptomics, proteomics, metabolomics and epigenomics.AI can integrate these datasets to identify patterns associated with stress tolerance and to predict plant responses under different environmental conditions (Table 3).The relationship between genotype, molecular response, physiological response and phenotype can be analysed using AI-based models. These models may assist in genotype selection, stress-tolerance prediction, genotype by environment analysis, candidate gene identification and breeding value estimation.Supervised machine-learning approaches are increasingly being used to investigate gene functions, molecular activities and genotype responses under abiotic stress. AI-assisted breeding can improve the prioritization of promising genotypes and reduce the time required for screening large populations. However, high predictive accuracy does not necessarily establish biological causality. Functional experiments are required to confirm the mechanisms responsible for stress tolerance.Recent research on combined drought and heat stress indicates that AI is most useful when prediction is supported by molecular, physiological and field-based validation (Xu et al., 2026).

Combined Stress Prediction

Plants commonly experience more than one environmental stress at the same time. Important combinations include drought with heat, salinity with heat, and drought with salinity.Drought reduces water availability, heat increases evaporative demand, and salinity produces osmotic and ionic stress. These factors may interact and generate plant responses that differ from those caused by individual stresses.Combined drought and heat stress should not be considered a simple addition of separate drought and heat responses. Plant age, genotype, stress intensity, stress duration and environmental conditions strongly influence the final response (Zandalinas et al., 2020; Xu et al., 2026). AI can help identify relationships among environmental variables, physiological traits and stress outcomes. It may also support the prediction of plant performance under complex field conditions (Table 5). However, combined-stress datasets are still limited. Reliable prediction requires factorial experiments, standardized stress treatments, diverse genotypes and independent validation under field conditions.The integration of AI with multi-omics, high-throughput phenotyping and environmental monitoring may provide a stronger framework for understanding complex stress interactions and developing climate-resilient crops.

AI and Sustainable Development

Artificial intelligence can advance sustainable development by raising agricultural productivity while lowering the overuse of water, fertilizers, pesticides and other natural resources, because AI systems can process large environmental, physiological and farm datasets to support timely, site-specific decisions (Kamilaris and Prenafeta-Boldú, 2018). AI-assisted crop monitoring can detect subtle, early changes in plant health before severe symptoms appear, enabling farmers to apply suitable management practices at the correct time and thereby reduce crop losses and unnecessary chemical applications (Sharma et al., 2026). Smart irrigation systems that combine soil moisture data, weather forecasts, crop condition and plant water requirements can improve irrigation scheduling and reduce water wastage in fields, while AI-based nutrient management can estimate soil nutrient status and recommend the appropriate timing and quantity of fertilizer to improve nutrient use efficiency and limit nutrient losses (Agricultural Water Management, 2026).AI can further support sustainable crop protection by identifying plant diseases, pests and abiotic stress through image analysis, remote sensing and sensor-based monitoring, which helps reduce routine, excessive pesticide use and promotes more environmentally responsible crop management (Rajbongshi et al., 2026). Integrating AI with Internet of Things devices, drones, remote sensing and cloud computing provides continuous information on crop and environmental conditions, improving resource management and enabling

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

real-time decision-making in precision agriculture (Mittal and Bhushan, 2026). AI-based yield prediction models help farmers and planners estimate crop performance under different environmental scenarios, supporting crop planning, food-supply management and strategies to reduce production risks, while AI-assisted phenotyping and breeding can identify tolerant genotypes to develop varieties that perform better under drought, salinity and temperature stress (Karkikatti et al., 2026). To ensure these contributions align with Sustainable Development Goals such as Zero Hunger, Clean Water and Sanitation, Responsible Consumption and Production, Climate Action, and Life on Land, AI technologies must be affordable, transparent and validated in the field, with training for farmers and integration of local agricultural knowledge so that AI acts as a decision-support tool alongside scientists and practitioners rather than replacing human expertise (Dutta et al., 2026).

Table 5. Major Research Gaps and proposed future solutions

Research gap	Current limitation	Proposed future solution
Data quality and quantity	Small, uneven or poorly standardized datasets	Develop large, standardized and diverse datasets with clear metadata
Limited field validation	Many models are tested under controlled conditions	Increase multi-location and multi-season field validation
Model interpretability	Some AI models provide predictions without clear biological explanation	Use explainable AI and biologically meaningful features
Cross-environment performance	Models may perform poorly in new environments or genotypes	Use transfer learning, domain adaptation and external validation
Compound stress prediction	Most studies focus on single stresses	Develop models using realistic combined-stress experiments
Multimodal data integration	Different data types are difficult to combine	Develop robust data-fusion and multimodal AI frameworks
AI-assisted breeding	Prediction is not always connected to breeding decisions	Integrate AI with genomics, phenotyping and genotype, environment analysis
Real-time deployment	High computational requirements can limit field use	Develop edge AI, low-cost sensors and efficient models

Conclusion

This review presents an AI-driven approach for understanding and predicting plant responses to climate-related stresses.The proposed framework combines environmental data with plant phenotypic, physiological and molecular information.It uses advanced AI techniques to analyse complex data collected from different sources. Such integration can help identify early changes in plants exposed to drought, salinity and temperature stress. The approach goes beyond the conventional identification of stress symptoms. It focuses on predicting plant growth, performance and responses under changing environmental conditions. It also considers the interaction between plant genetic characteristics and environmental factors. Overall, this framework can assist in developing climate-resilient crops and promoting sustainable agricultural practices.

Abstract

India's Viksit Bharat @2047 vision requires a knowledge-driven digital economy powered by artificial intelligence, inclusive entrepreneurship, FinTech, e-commerce and sustainable practices. Library and Information Science (LIS) institutions remain under-utilised as active intermediaries between knowledge resources and the competencies demanded by the future of work. This paper coins the Knowledge-Commerce Bridge (KCB) Framework—an original, multi-layered LIS model that positions academic and public libraries as AI-enabled hubs for digital-commerce literacy, ethical information services and sustainable innovation. The study adopts a conceptual-constructive design that synthesises LIS theory, digital-economy literature, AI-ethics guidelines and national policy documents (NEP-2020, Digital India, Startup India). The KCB Framework comprises four interdependent layers: (1) Infrastructure and Multilingual Access, (2) AI Knowledge Processing, (3) User-Centric Commerce Services and (4) Ethical-Sustainable Governance. Expected outcomes include reduced information asymmetry for gig workers and micro-entrepreneurs, strengthened academia–industry–startup linkages, and measurable contributions to inclusive growth and the Sustainable Development Goals. The framework is offered as a replicable, emulable blueprint that other institutions can adapt, pilot and scale, thereby leaving a durable mark on both scholarship and practice.

Keywords: *Knowledge-Commerce Bridge (KCB) Framework; Library and Information Science; Artificial Intelligence; Digital Economy; FinTech Literacy; Gig Economy; Sustainable Innovation; Entrepreneurship; Viksit Bharat @2047; Information Literacy; NEP-2020*

Introduction

The national aspiration of Viksit Bharat @2047 envisions a developed, inclusive, innovative and globally competitive India driven by knowledge, technology, entrepreneurship and sustainable economic growth. Rapid advances in Artificial Intelligence, Industry 5.0, FinTech, e-commerce, digital finance and the gig economy are reshaping employment, business practices and educational needs. These transformations demand future-ready professionals equipped with multidisciplinary knowledge, digital competencies and ethical values. The scale and speed of this transformation place unprecedented responsibility on knowledge institutions. While technology and policy frameworks are advancing rapidly, the human and informational capacity to utilise these developments inclusively remains uneven. Libraries, with their long-standing tradition of equitable access, trusted information provision and community engagement, are uniquely positioned to address this imbalance. However, their potential contribution to the digital economy has not yet been systematically conceptualised or operationalised. While policy initiatives such as Digital India, Startup India, Skill India and NEP-2020 provide the enabling environment, the critical knowledge-intermediation role of libraries has received limited systematic attention in the digital-commerce domain.

Website: https://bnir.us

Existing scholarship has examined smart libraries, AI-driven knowledge management and libraries as entrepreneurship hubs, yet a tightly integrated, operational LIS framework that explicitly bridges libraries with digital commerce, FinTech literacy, gig-work support and sustainable business practices remains absent. This paper fills that gap by coining the Knowledge-Commerce Bridge (KCB) Framework. The framework is designed to be practical, scalable and emulable, enabling libraries of varying resource levels—especially those in semi-urban and rural settings—to contribute directly to the digital-economy and sustainability pillars of Viksit Bharat @2047. By repositioning libraries as active bridges between knowledge resources and economic opportunity, the KCB Framework aims to strengthen the foundational knowledge infrastructure required for an inclusive and sustainable digital future.

Literature Review and Research Gap

Recent Indian LIS literature has proposed intelligent library architectures (for example, the Vidya-Grid Architecture), explored AI applications in cataloguing and reference services, and documented libraries functioning as makerspaces or entrepreneurship support centres. Parallel streams examine digital literacy for employment, open-access knowledge democratisation, and the role of public libraries in bridging the rural–urban divide. International work highlights libraries as collaborators in local innovation ecosystems and the potential of generative AI for personalised knowledge services. These contributions have significantly advanced the understanding of how libraries can adopt emerging technologies and support broader developmental goals. Intelligent library models have demonstrated the value of AI in improving discovery, personalisation and operational efficiency. Entrepreneurship-oriented initiatives have shown that libraries can serve as physical and social spaces for innovation. Digital literacy programmes have highlighted the continuing importance of libraries in addressing skill gaps, particularly among first-generation learners and rural populations. However, these contributions remain largely siloed. Models of intelligent libraries tend to prioritise general knowledge access and system efficiency. Entrepreneurship-hub literature focuses primarily on makerspaces, mentoring and incubation support, with limited attention to the specific informational needs of digital commerce, FinTech compliance, ESG reporting or platform-based work. Digital literacy initiatives often address foundational skills without systematically connecting them to the rapidly evolving requirements of the gig economy and sustainable business practices. No existing framework comprehensively integrates domain-specific AI knowledge processing for commerce and finance, user-centric services designed for gig workers and micro-entrepreneurs, and ethical-sustainable governance as a core architectural layer, while simultaneously aligning these elements with the commerce, innovation and sustainability pillars of Viksit Bharat @2047.

The Knowledge-Commerce Bridge (KCB) Framework is proposed to address this precise conceptual and practical gap.

Theoretical Foundations

The framework draws upon information literacy and metaliteracy theories that emphasise critical evaluation and ethical use of information in AI-rich environments. These theories recognise that users must not only access information but also understand how AI systems shape, filter and generate knowledge. Community informatics and knowledge organisation principles further inform the design of inclusive, structured and contextually relevant information services. Responsible AI and algorithmic accountability guidelines provide the ethical foundation for the deployment of AI tools within library settings, stressing transparency, fairness, privacy and human oversight. Sustainable development and green library concepts contribute an environmental and social responsibility dimension, ensuring that technological advancement does not occur at the expense of ecological or social well-being. At the national level, the framework is anchored in NEP-2020's emphasis on multidisciplinary education, Digital Public Infrastructure, and the vision of Atmanirbhar Bharat. Together, these theoretical strands provide a robust and coherent foundation for the KCB Framework.

The Knowledge-Commerce Bridge (KCB) Framework

Differentiation from Existing Frameworks

Existing models such as the Vidya-Grid Architecture focus primarily on intelligent library systems for general knowledge access, multilingual search and cultural preservation. Entrepreneurship-hub literature emphasises makerspaces and incubation support. Digital-literacy initiatives target broad employability. The KCB Framework is distinct in three respects: (a) it centres digital-commerce, FinTech, ESG and gig-economy information needs as core service domains; (b) it embeds ethical-sustainable governance as an architectural layer rather than an afterthought; and (c) it explicitly maps library services onto the commerce, innovation and sustainability pillars of

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Viksit Bharat @2047. This focused bridging function constitutes its original contribution and offers a clearer pathway for libraries to demonstrate measurable relevance in the emerging digital economy.

The Four Layers

Layer 1 – Infrastructure and Multilingual Access

Hybrid cloud-edge architecture leveraging national digital infrastructure (NDLI, e-Granthalaya and Bhashini). It provides inclusive interfaces supporting major Indian languages, low-bandwidth modes and assistive technologies to ensure last-mile reach for rural and peri-urban users. A concrete service example is a low-bandwidth mobile-first portal offering voice-search in Marathi, Hindi and English for commerce students and local micro-entrepreneurs. This layer recognises that technological sophistication is meaningful only when it remains accessible to users with varying levels of connectivity, language proficiency and digital familiarity.

Layer 2 – AI Knowledge Processing

Domain-tuned retrieval-augmented generation for FinTech regulations, digital payment systems, e-commerce platforms, ESG and green-business reporting, and open educational resources. It includes smart metadata generation, predictive collection development and fact-checked market-intelligence dashboards, supported by multilingual NLP and voice interfaces. A concrete service example is a "Market and Compliance Brief" chatbot that generates verified, cited summaries of UPI guidelines, ONDC seller onboarding or green-business tax incentives within sixty seconds. By focusing AI capabilities on high-value commerce and sustainability domains, this layer transforms generic information retrieval into targeted decision support.

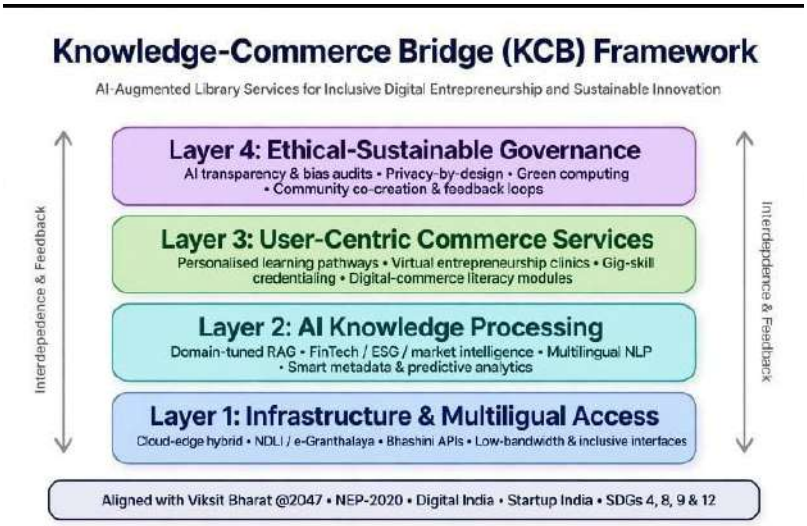
Layer 3 – User-Centric Commerce Services

Personalised learning pathways for digital-commerce competencies, virtual entrepreneurship clinics and gig-skill modules, AI-assisted business-plan and compliance support, and portable digital credentials aligned with the National Credit Framework. Community co-creation spaces link students, startups and local enterprises. Concrete service examples include modular micro-courses on digital payments, online marketplace operations and basic ESG reporting; an AI-assisted business-plan template linked to open datasets; and gig-skill credentialing support. This layer shifts the library from a passive information provider to an active facilitator of economic capability.

Layer 4 – Ethical-Sustainable Governance

Transparent AI usage policies, privacy-by-design, algorithmic-bias audits, green computing practices and continuous community feedback loops. This layer aligns library operations with SDG 4, 8, 9 and 12 while safeguarding academic integrity and user trust. A concrete mechanism is a quarterly community feedback forum together with a public transparency dashboard showing AI tool usage statistics and energy footprint. Embedding governance as a structural layer rather than a compliance checklist ensures that technological advancement remains responsible and socially legitimate.

The overall architecture of the Knowledge-Commerce Bridge (KCB) Framework, showing the four interdependent layers and their alignment with national priorities, is illustrated in Figure 1.



© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Figure 1
The Knowledge-Commerce Bridge (KCB) Framework – four interdependent layers linking library infrastructure, AI processing, user-centric commerce services, and ethical-sustainable governance for Viksit Bharat @2047.

Adoption Rationale and Expected Impact

Libraries should adopt the KCB Framework because it converts existing digital infrastructure and staff expertise into measurable contributions to institutional NEP-2020 goals, Startup India linkages and the digital-economy agenda of Viksit Bharat @2047. Paramount benefits include direct enhancement of digital-commerce and FinTech literacy among students and local economic actors; reduced information asymmetry for gig workers and micro-enterprises; strengthened positioning of the library as a strategic partner in entrepreneurship and industry cells; alignment with accreditation and ranking parameters that value innovation, inclusion and sustainability; and a modular design that permits phased implementation with modest incremental cost, enabling even resource-constrained college libraries to generate visible impact and publishable case evidence.

At the institutional level, adoption of the framework can enhance the library's visibility and relevance within the college or university ecosystem, particularly in institutions offering commerce, management and vocational programmes. At the national level, widespread adoption would strengthen the knowledge infrastructure supporting inclusive digital economic participation and responsible innovation — both essential components of the Viksit Bharat vision.

Implementation Roadmap and Sample Pilot KPIs

Phase	Duration	Focus	Sample Key Performance Indicators
1	0–6 months	Baseline & capacity	Staff trained (target ≥ 80 %); baseline literacy scores recorded
2	6–18 months	Core services (Layers 1–3)	≥ 300 unique users from target segments; ≥ 40 % improvement in post-test digital-commerce literacy; ≥ 5 co-created startup or skill outputs
3	18–36 months	Full governance & scale	Transparency dashboard live; energy and AI-audit reports published; toolkit shared with ≥ 3 peer libraries

Phase 1 (0–6 months) focuses on baseline assessment and capacity building, with sample key performance indicators of staff trained (target ≥ 80 per cent) and baseline literacy scores recorded. Phase 2 (6–18 months) focuses on core services (Layers 1–3), with sample key performance indicators of at least 300 unique users from target segments, at least 40 per cent improvement in post-test digital-commerce literacy, and at least five co-created startup or skill outputs. Phase 3 (18–36 months) focuses on full governance and scale, with sample key performance indicators of a live transparency dashboard, published energy and AI-audit reports, and toolkit shared with at least three peer libraries. Critical success factors include active partnership with Commerce and Economics departments, visible senior management support, and continuous user co-design. Successful implementation also requires clear role definition among library staff, faculty collaborators and student volunteers, as well as regular monitoring and adaptive refinement of services based on user feedback.

Potential Challenges and Mitigation

The digital divide and infrastructure gaps in semi-urban and rural settings can limit reach; these are mitigated by prioritising low-bandwidth design and leveraging already-available national platforms such as NDLI, e-Granthalaya and Bhashini. Staff skill gaps in AI tools and digital-commerce domains among LIS professionals are addressed through targeted continuous professional development programmes and formal partnerships with Commerce, Economics and Computer Science departments. Algorithmic risk, including bias and privacy concerns, is managed by mandatory ethics audits, human-in-the-loop oversight and transparent disclosure of AI usage. Funding constraints are overcome by the modular, phased adoption approach that begins with free or low-cost open-source tools and expands only after demonstrated impact, supplemented by public–private–academia collaboration. Anticipating these challenges and embedding mitigation strategies from the outset increases the likelihood of sustainable and equitable implementation.

Limitations and Future Research

This is a conceptual framework. Empirical validation through multi-site pilots is required.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Future work should include comparative studies across library types, longitudinal impact tracking, and refinement of AI models trained on Indian-language commerce and sustainability corpora. Further research may also examine the framework's adaptability in different regional and linguistic contexts and its potential contribution to national digital public infrastructure initiatives.

Conclusion

By coining the Knowledge-Commerce Bridge (KCB) Framework, this paper offers a virgin, actionable and emulable contribution that positions LIS at the heart of India's digital-economy and sustainability ambitions. Libraries cease to be passive repositories and become active bridges connecting knowledge, AI capabilities, entrepreneurial opportunity and ethical progress. Systematic adoption and further research on the KCB Framework can leave a lasting scholarly and practical mark on the journey to Viksit Bharat @2047. In doing so, the framework not only advances the professional and academic discourse within Library and Information Science but also contributes a concrete pathway through which knowledge institutions can support the creation of a more inclusive, innovative and sustainable India.

Abstract

India's developmental trajectory inevitably encounters the dual challenge of balancing poverty alleviation for one of the world's largest populations while avoiding the environmental consequences that have beset many industrialised nations. This paper explores how India's environmental policy architecture — from early conservation statutes to the recent suite of climate missions, the Panchamrit commitments, and the Lifestyle for Environment (LiFE) movement — has evolved into an instrument of sustainable development rather than a constraint upon growth. The paper situates this policy architecture in India's long-term development blueprint, Viksit Bharat @2047, which envisions India as a fully developed nation by the hundredth anniversary of its independence. The paper argues that environmental sustainability is not a peripheral concern within Viksit Bharat 2047 but one of its structural pillars, since climate risk, resource security, and green industrial competitiveness will substantially determine whether India's growth is durable. The paper also identifies the principal obstacles — continued coal dependence, uneven state-level enforcement, financing gaps, and the need for a just transition for workers in carbon-intensive sectors — and closes with policy recommendations for aligning India's environmental governance more tightly with its 2047 ambitions.

Keywords: *Sustainable development; environmental policy; Viksit Bharat 2047; Panchamrit; green growth; climate governance; India.*

Introduction

Sustainable development is conventionally understood as development that meets present needs without compromising the ability of future generations to meet their own — a definition first popularised by the Brundtland Commission in 1987. For India, a country of over 1.4 billion people undergoing rapid urbanisation and industrial expansion, this balancing act carries particular weight. India is simultaneously among the countries most vulnerable to climate change impacts and among the fastest-growing large economies with an accompanying rise in energy demand, resource consumption, and waste generation. Over the past five decades, India's approach to the environment has shifted from a narrow focus on pollution control and wildlife protection to an integrated framework that treats ecological stewardship as inseparable from economic and social policy. This shift has accelerated markedly in the last decade, coinciding with the government's articulation of a long-term national vision — Viksit Bharat @2047, or 'Developed India by 2047' — timed to the centenary of India's independence. This paper explores the substantive content of India's environmental policies, evaluates the extent to which they embody the principles of sustainable development, and analyses their role in enabling the broader Viksit Bharat 2047 agenda. **Evolution of India's Environmental Policy Framework**

India's formal engagement with environmental governance can be traced to its participation in the 1972 UN Conference on the Human Environment in Stockholm, after which the country enacted foundational legislation such as the Wildlife Protection Act (1972), the Water (Prevention and Control of Pollution) Act (1974), the Forest (Conservation) Act (1980), and the umbrella Environment (Protection) Act (1986), passed in the aftermath of the Bhopal gas tragedy.

Website: https://bnir.us

These early laws were largely regulatory in character, designed to control specific pollutants or protect specific ecosystems. A more integrated approach emerged with the National Environment Policy of 2006, which explicitly linked environmental conservation to poverty reduction and livelihood security, and with the National Action Plan on Climate Change (NAPCC) of 2008, which organised climate action into eight thematic national missions covering solar energy, energy efficiency, sustainable habitats, water, the Himalayan ecosystem, forestry, sustainable agriculture, and strategic knowledge for climate change. This period marked the transition of Indian environmental policy from a compliance-oriented model to a development-oriented one, in which ecological goals were pursued alongside, rather than in opposition to, economic objectives. The most recent phase, beginning roughly in the mid-2010s, has been characterised by mission-mode, technology-driven programmes and binding international commitments, discussed in the following section.

Key Contemporary Policies and Missions

1. The Panchamrit Commitments

At the 26th Conference of the Parties (COP26) in Glasgow in November 2021, India announced five climate pledges collectively termed Panchamrit ('five nectars'): reaching 500 gigawatts of non-fossil energy capacity by 2030; meeting fifty per cent of energy requirements from renewable sources by 2030; cutting projected cumulative carbon emissions by one billion tonnes by 2030; reducing the emissions intensity of GDP by forty-five per cent from 2005 levels by 2030; and achieving net-zero emissions by 2070. These targets have since been formally reflected in India's updated Nationally Determined Contributions under the Paris Agreement and now anchor most subsequent energy and industrial policy.

2. Renewable Energy and Green Hydrogen

The National Solar Mission and successive Production-Linked Incentive schemes for solar modules and advanced battery chemistry have driven a substantial expansion of renewable capacity, with India's installed non-fossil generation capacity having crossed the halfway mark toward the 500 GW target. The National Green Hydrogen Mission, approved in January 2023 with an outlay of roughly ₹19,744 crore, aims to position India as a global hub for the production and export of green hydrogen, targeting at least five million tonnes of annual production capacity by 2030 and a substantial reduction in production cost.

3. Electric Mobility and Industrial Decarbonisation

The FAME (Faster Adoption and Manufacturing of Electric Vehicles) scheme and state-level EV incentive programmes seek to raise the share of electric vehicles in new sales, while the Carbon Credit Trading Scheme, now entering compliance for several hundred large industrial entities across multiple sectors, introduces a domestic market mechanism for pricing industrial emissions.

4. Mission LiFE (Lifestyle for Environment)

Launched in 2022, Mission LiFE complements supply-side policy with a demand-side behavioural approach, encouraging individuals and communities to adopt resource-conserving lifestyles — reducing waste, conserving water and energy, and favouring sustainable consumption — on the premise that durable environmental outcomes require mass behavioural change alongside technological and regulatory reform.

5. Conservation, Water, and Waste Management

Programmes such as Namami Gange (river rejuvenation), the Green India Mission (afforestation and forest quality improvement), the Jal Jeevan Mission (rural water security), and Swachh Bharat Mission (sanitation and solid waste management) address the ecological foundations on which broader sustainability depends. These programmes are increasingly designed around circular-economy principles, particularly in waste management and water reuse.

Linking Environmental Policy to Sustainable Development

India's environmental policy suite maps closely onto the United Nations Sustainable Development Goals (SDGs), particularly SDG 7 (affordable and clean energy), SDG 9 (industry, innovation, and infrastructure), SDG 11 (sustainable cities), SDG 12 (responsible consumption and production), and SDG 13 (climate action). What distinguishes the Indian approach is its explicit framing of environmental action as a source of economic opportunity rather than solely a cost. Renewable energy manufacturing, green hydrogen, electric mobility, and related value chains are treated as emerging industrial sectors capable of generating employment and export revenue, an approach often described in Indian policy discourse as 'green growth'. Analysts have estimated that India's green economy could unlock a market of the order of one trillion US dollars and sustain tens of millions of jobs by 2047 if investment and institutional capacity scale as planned, underscoring the extent to which environmental and economic objectives have become intertwined in policy design.

Viksit Bharat @2047: Vision and Pillars

Viksit Bharat @2047 is the government's overarching vision for transforming India into a fully developed nation by 2047, the hundredth year of independence. While the vision is most commonly discussed in terms of economic scale — aspirations toward a multi-trillion-dollar economy, expanded manufacturing capacity, and technological self-reliance — its official framing rests on four broad pillars: economic growth and competitiveness, social progress and inclusion, good governance, and environmental sustainability. Under this framing, environmental sustainability is not treated as an afterthought but as one of the structural conditions for a 'developed' status that is meaningful and durable. The explicit inclusion of environmental sustainability within the Viksit Bharat framework reflects an underlying recognition: a nation cannot credibly be called developed if its growth model degrades the ecological systems, air quality, water security, and climate stability on which its population depends. This represents a departure from earlier development paradigms that treated environmental protection and economic growth as sequential.

The Role of Environmental Policy in Achieving Viksit Bharat 2047

1. Managing Climate Risk to Growth

Unmanaged climate change poses a direct threat to the economic ambitions embedded in Viksit Bharat 2047. Analyses of climate-related economic risk suggest that extreme heat alone could shave several percentage points off India's GDP by 2030, while losses potentially compounding substantially by mid-century, and labour productivity losses from heat stress could run into hundreds of billions of dollars. Environmental policy — through climate adaptation planning, heat-action plans, and resilient infrastructure standards — therefore functions as a form of economic risk management essential to keeping the 2047 growth trajectory on track.

2. Building New Engines of Growth

Beyond risk mitigation, environmental policy is being positioned as a direct contributor to the economic scale that Viksit Bharat 2047 envisions. Renewable energy manufacturing, battery and green hydrogen value chains, electric vehicle production, and energy-efficiency services are emerging as new industrial sectors, supported by production-linked incentives and mission-mode public investment. To the extent these sectors mature, they can reduce India's reliance on imported fossil fuels — improving both energy security and the trade balance — while creating employment in manufacturing and services.

3. Urban and Infrastructure Sustainability

Because a large share of India's future economic activity and population growth will be urban, the sustainability of India's cities is central to Viksit Bharat 2047. Compact, transit-oriented, and energy-efficient urban development can simultaneously reduce emissions, ease congestion, and improve air quality and public health, generating what analysts describe as parallel dividends in productivity and quality of life. Programmes for urban water and sanitation, waste management, and public transit expansion are accordingly framed as core Viksit Bharat infrastructure rather than purely environmental initiatives.

4. Global Positioning and Climate Diplomacy

Meeting the Panchamrit commitments also carries diplomatic and trade significance. As major economies introduce carbon border adjustment mechanisms and sustainability-linked trade conditions, credible progress on emissions intensity and renewable energy strengthens India's negotiating position and helps insulate its exporters from future trade barriers. In this sense, environmental compliance is becoming a determinant of continued market access for Indian industry.

Challenges and Constraints

Despite considerable policy ambition, several structural constraints could slow the translation of environmental policy into the outcomes Viksit Bharat 2047 requires.

- Continued coal dependence: Coal still supplies more than half of India's electricity generation, and the pace of its phase-down remains constrained by energy security needs, employment in coal-producing regions, and the intermittency of renewable sources.
- Financing gaps: The scale of investment required for renewable energy, green hydrogen, and climate-resilient infrastructure substantially exceeds current public spending, making the mobilisation of private and green finance essential yet underdeveloped.
- Uneven enforcement and environmental federalism: Because land, water, and many aspects of environmental regulation fall partly under state jurisdiction, implementation capacity and enforcement rigor vary considerably across states, weakening the consistency of national policy.
- Just transition concerns: Workers and communities dependent on fossil-fuel industries and carbon-intensive agriculture face displacement risk as the economy decarbonises, and robust social protection and reskilling mechanisms for this transition remain at an early stage.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

• Slow uptake of new instruments: Mechanisms such as the Carbon Credit Trading Scheme and the National Green Hydrogen Mission remain in comparatively early stages relative to their 2030 targets, indicating a gap between policy design and on-the-ground implementation.

Policy Recommendations

• Align fiscal incentives, taxation, and public procurement more systematically with net-zero and renewable-energy goals, so that market signals reinforce mission-mode programmes.

• Institutionalise just-transition planning at the state level, particularly in coal-dependent regions, including dedicated funding for worker reskilling and economic diversification.

• Strengthen environmental enforcement capacity and monitoring at the state and municipal level, supported by digital compliance and reporting tools.

• Expand blended and green finance instruments to close the investment gap in renewable energy, green hydrogen, and climate-resilient infrastructure.

• Accelerate the shift from reactive regulation to anticipatory, technology-inclusive policy design, particularly for emerging sectors such as green hydrogen, energy storage, and circular waste management.

• Continue scaling behavioural programmes such as Mission LiFE alongside supply-side investment, recognising that sustainable consumption patterns are as important as clean production.

Conclusion

India's environmental policy framework has evolved substantially from its origins in pollution control and species protection to encompass renewable energy, green industry, urban safety, and behavioural change. This evolution is not incidental to Viksit Bharat @2047 but central to it: the vision explicitly treats environmental sustainability as one of the pillars of a developed India, alongside economic growth, social progress, and governance reform. Whether India can realise this vision by 2047 will depend substantially on how effectively it manages the risks that climate change poses to its growth, how successfully it builds new green industries at scale, and how equitably it manages the transition away from carbon-intensive livelihoods. If pursued with sustained investment, stronger institutional capacity, and a genuine commitment to a just transition, India's environmental policies can serve not merely as a safeguard against ecological harm but as one of the principal engines of the developed, resilient, and equitable nation that Viksit Bharat 2047 envisions.

Abstract

India's aspiration to become a Viksit Bharat, a developed nation, by the centenary of its independence in 2047 rests on the premise of a secure, resilient and self-reliant State. Among the non-traditional security threats that could derail this trajectory, bioterrorism occupies a uniquely dangerous position because of its capacity for silent, borderless and exponential harm. This paper undertakes a critical examination of India's existing legal, constitutional and institutional architecture for biosecurity governance and asks whether it is adequate to the demands of the Viksit Bharat vision. It begins by situating bioterrorism and biosecurity within a conceptual framework that distinguishes deliberate biological attacks from natural epidemics and accidental laboratory releases. It then traces the constitutional foundations of public health and security governance under Articles 21, 47, 246 and 253 and the relevant entries of the Seventh Schedule, before undertaking a systematic audit of the statutory landscape, including the colonial-era Epidemic Diseases Act, 1897, the Disaster Management Act, 2005, the Environment (Protection) Act, 1986, the Biological Diversity Act, 2003, and the Weapons of Mass Destruction Act, 2005. The paper maps the institutional architecture spanning the National Disaster Management Authority, the Department of Biotechnology, the National Centre for Disease Control and allied defence agencies, and evaluates India's compliance with the Biological Weapons Convention and allied international regimes. Drawing on comparative material from China, Australia, the United Kingdom and the European Union, the paper identifies structural gaps, including fragmented jurisdiction, the absence of a dedicated biosecurity statute, weak dual-use research oversight and inadequate civil-military-scientific coordination. It concludes by proposing a reform roadmap, anchored in a unified Biosecurity Act, a National Biosecurity Authority and a One Health approach, as a precondition for realising the security dimension of Viksit Bharat @2047.

Keywords: *Bioterrorism; Biosecurity; Viksit Bharat @2047; Biological Weapons Convention; National Disaster Management Authority.*

Introduction

India's declared ambition to transform itself into a Viksit Bharat, or developed nation, by 2047 is built on four pillars identified by the government's own strategic planning apparatus: economic competitiveness, national security and stability, global partnerships, and legal and institutional reform.[1]

[1] NITI Aayog, Vision for Viksit Bharat @2047: An Approach Paper, https://www.niti.gov.in/node/1630 (last visited Sept. 2, 2026).

These pillars are explicitly interdependent, and the Prime Minister's own articulation of the vision has repeatedly linked India's developmental trajectory to its capacity for self-reliance and strategic resilience in the face of both conventional and non-traditional threats.[2] Bioterrorism, the deliberate use of pathogens or toxins to cause death, disease or panic for political or ideological ends, is among the most consequential of these non-traditional threats precisely because it does not respect the ordinary logic of deterrence, borders or proportionality that governs conventional security threats. The COVID-19 pandemic demonstrated, even where the origin of the outbreak was natural rather than deliberate, how a biological event can paralyse an economy of India's scale, overwhelm its health infrastructure and expose the fragility of a legal regime that still relies, in substantial part, on a public health statute drafted in 1897 to control the plague in colonial Bombay.[3] If a naturally occurring pathogen could inflict such disruption, the deliberate, engineered release of a biological agent by a State or non-State actor poses a qualitatively graver risk, one compounded by the rapid diffusion of dual-use biotechnology, gene-editing tools and synthetic biology capabilities that lower the technical threshold for malicious actors.[4] India has, in fact, already witnessed instances of attempted misuse of biological toxins, including reported efforts to weaponize ricin derived from castor oil for a terrorist attack, underscoring that the threat is not merely theoretical.[5]

This paper proceeds from the premise that biosecurity, understood as the set of measures designed to prevent the deliberate, accidental or natural misuse of biological agents, is not a peripheral concern for a nation pursuing developed-country status but a foundational precondition for it. A State that cannot guarantee the biological safety of its population, its agriculture and its scientific infrastructure cannot credibly present itself as economically competitive, strategically autonomous or globally influential. The central research question addressed here is whether India's current legal, constitutional and institutional framework for governing bioterrorism is structurally capable of meeting this precondition, or whether it remains a patchwork of colonial-era, environmental and disaster-management statutes never designed with deliberate biological attacks in mind.

The paper is organised into eleven parts. Following this introduction, Part II develops a conceptual vocabulary distinguishing bioterrorism from biosafety and biosecurity failures more broadly. Part III situates the biosecurity question within the Viksit Bharat @2047 framework. Parts IV to VII examine, respectively, the constitutional foundations, the statutory landscape, the institutional architecture and India's international obligations. Part VIII critically evaluates the gaps in this framework, Part IX draws comparative lessons from other jurisdictions, Part X proposes reforms, and Part XI concludes.

Conceptualising Bioterrorism And Biosecurity

Bioterrorism is generally understood, following the working definition used by international policing agencies, as the intentional release of biological agents or toxins to harm or kill humans, animals or plants for the purpose of intimidating or coercing a government or civilian population in furtherance of political or social objectives.[6] This definition contains three constitutive elements that are of legal significance: first, an act of deliberate release or threatened release of a biological agent; second, an intent to cause harm, whether to human, animal or plant life, or economic disruption; and third, a coercive or ideological motive directed at a government or population. Each of these elements distinguishes bioterrorism from two adjacent but analytically distinct phenomena that Indian law tends to conflate: natural epidemics, which lack the element of deliberate human agency, and laboratory biosafety failures, which lack the element of malicious intent even though they may result from negligence in handling pathogens. Biosecurity, as a governance concept, is broader than the narrow prevention of bioterrorism. It encompasses the full suite of measures directed at preventing the misuse, theft, diversion or accidental

release of pathogens and toxins that could threaten public health, agriculture, biodiversity or national security, and is frequently distinguished from biosafety, which concerns the containment of dangerous biological agents to protect laboratory personnel and the environment from accidental exposure rather than deliberate misuse.[7] A comprehensive biosecurity framework must therefore address dual-use research of concern, that is, legitimate scientific research whose findings or techniques could be repurposed for hostile use, the physical and cyber security of pathogen repositories and genomic databases, the surveillance systems necessary for early detection of unusual disease patterns, and the legal and institutional capacity to attribute, investigate and prosecute deliberate biological attacks. For the purposes of this paper, bioterrorism governance is treated as the specific subset of the broader biosecurity project concerned with deterring, detecting, attributing and responding to intentional biological attacks, while recognising that the legal instruments and institutions relevant to this task substantially overlap with those governing biosafety, disaster management and public health more generally. This overlap, as the analysis in Parts V and VI demonstrates, is itself a principal source of the fragmentation that characterises the Indian framework.

Viksit Bharat @2047: Situating Biosecurity Within The Developmental Vision

The NITI Aayog's approach paper on Viksit Bharat @2047 envisions India achieving a gross domestic product in the range of thirty to forty trillion United States dollars, a substantial rise in per capita income, and the elimination of extreme poverty by the centenary of independence, alongside net-zero carbon commitments and universal access to quality healthcare.[8] National security and stability are identified as one of the four pillars underpinning this vision, alongside economic competitiveness, global partnerships and legal and institutional reform, with an explicit recognition that these pillars are mutually reinforcing rather than independent tracks of development.[9]

This developmental vision has an implicit biosecurity dimension that has received comparatively little attention in mainstream policy discourse, which tends to focus on cyber security, border security and conventional defence modernisation. Yet the achievement of a thirty-trillion-dollar economy presupposes an uninterrupted trajectory of production, trade and human capital formation that a large-scale biological event, whether natural or deliberate, is capable of derailing for years at a time, as the post-pandemic recovery period illustrated globally. Universal healthcare access, one of the explicit social objectives of Viksit Bharat, is meaningless without a health security architecture capable of detecting and containing biological threats before they escalate into epidemics. Similarly, India's ambition to become a global hub for biotechnology, pharmaceuticals and vaccine manufacturing, often cited as a comparative advantage in the Viksit Bharat framework, simultaneously expands the country's dual-use research footprint and, correspondingly, the biosecurity risks that must be managed if that advantage is not to become a vulnerability.

Biosecurity should therefore be read into the 'national security and stability' pillar as a distinct governance imperative, not merely as an adjunct to conventional disaster management. A Viksit Bharat that has not internalised these imperative risks building economic and technological capacity on a foundation that a single well-executed or even poorly contained biological event could substantially erode.

Constitutional Foundations Of Biosecurity Governance

The Constitution of India does not use the word 'biosecurity' or 'bioterrorism', but it furnishes several textual anchors from which a constitutional obligation to govern biological threats can be derived. Article 21 guarantees the right to life and personal liberty, and Indian constitutional jurisprudence has long read into this guarantee a right to public health and a right to a threat-free environment, both of which are directly implicated by the risk of a deliberate or accidental biological release.[10] Article 47 places upon the State a directive obligation to raise the level of nutrition and public health, situating biosecurity preparedness within the broader constitutional commitment to welfare governance even though directive principles remain non-justiciable.[11] On the distribution of legislative competence, entries 26 and 29 of List I of the Seventh Schedule assign to Parliament the fields of legal, medical and other professions insofar as they are federally regulated, and matters concerning quarantine, the prevention of the extension of infectious or contagious diseases from one State to

another, and the seas and boundaries of the Union relevant to external biological threats. Public health and sanitation, hospitals and dispensaries fall instead under List II as a State subject, while the prevention of the extension of infectious or contagious diseases from one State to another is placed in the Concurrent List, permitting both Parliament and State legislatures to legislate, subject to the primacy of Union law under Article 254 in case of conflict.[12][13] This bifurcated competence, sensible for the ordinary regulation of public health, creates a structural weakness for bioterrorism governance specifically, because a deliberate biological attack does not respect the neat separation of federal 'defence and external affairs' concerns from State-level 'public health' administration; it implicates both simultaneously and often instantaneously. Article 253 empowers Parliament to make laws for implementing India's international treaty obligations, including those arising from the Biological Weapons Convention, notwithstanding the ordinary distribution of legislative powers between the Union and the States.[14] This provision is of particular significance because it removes any federal-structure obstacle to Parliament enacting a comprehensive, unified biosecurity statute of the kind recommended in Part X below, since such a statute could be justified as implementing India's Convention obligations even where its subject matter might otherwise touch upon State List entries.

The Statutory Landscape

A. The Epidemic Diseases Act, 1897

The Epidemic Diseases Act, 1897, enacted originally to contain the bubonic plague in colonial Bombay, remains, more than a century later, the principal statute invoked by Union and State governments to impose special measures during disease outbreaks, including quarantine, travel restrictions and inspection powers.[15][16] The Act was amended in 2020, during the COVID-19 pandemic, to penalise violence against healthcare workers and to bring hospital infrastructure damage within its ambit, but this amendment left untouched the Act's fundamental orientation towards natural epidemics rather than deliberately engineered biological attacks.[17] The Act contains no provisions addressing the attribution of a deliberate biological release, no framework for coordinating with defence or intelligence agencies, and no meaningful safeguards for individual liberty, privacy or property during its enforcement, a gap that has long been flagged by policy analysts as inconsistent with contemporary constitutional expectations of proportionality and due process.[18]

B. The Disaster Management Act, 2005

The Disaster Management Act, 2005 defines 'disaster' broadly enough to encompass biological disasters, and empowers the National Disaster Management Authority to lay down policies, plans and guidelines for disaster management, including Chemical, Biological, Radiological and Nuclear emergencies.[19] Pursuant to this mandate, the National Disaster Management Authority issued detailed guidelines in 2008 on the management of biological disasters, covering preparedness, biosafety and biosecurity measures, capacity development, and the strengthening of the legislative and regulatory framework, and explicitly contemplating both biological warfare operations and incidents of bioterrorism as within its scope.[20] These guidelines, however, are advisory rather than binding, and their implementation depends heavily on inter-State and inter-agency coordination that the Act itself does not adequately mandate or resource, leaving a persistent gap between guideline and ground-level capability.[21]

C. Environmental and Biosafety Regulation

The Environment (Protection) Act, 1986 and the rules framed under it in 1989 regulate the manufacture, use, import, export and storage of hazardous micro-organisms and genetically engineered organisms, and constitute India's primary biosafety, as opposed to biosecurity, regulatory regime.[22][23] The Department of

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Biotechnology supplemented this framework in 2017 with guidelines specifically addressing recombinant DNA research and biocontainment, aimed at laboratory-level risk management.[24] The Biological Diversity Act, 2003, meanwhile, is oriented towards the conservation of biological resources and the equitable sharing of benefits arising from their use, and bears only an indirect and limited relationship to biosecurity or bioterrorism as such.[25] None of these instruments was designed with the deliberate weaponisation of pathogens in view, and their enforcement architecture, built around environmental compliance and research ethics committees, is structurally distinct from the security and intelligence apparatus that a bioterrorism-specific response would require.

D. Security Legislation

The Weapons of Mass Destruction and Their Delivery Systems (Prohibition of Unlawful Activities) Act, 2005 is the closest India has to a dedicated counter-bioterrorism statute, criminalising the manufacture, acquisition, possession, development or transfer of biological, chemical or nuclear weapons and their delivery systems by unauthorised persons, in fulfilment of India's obligations under United Nations Security Council Resolution 1540.[26] While the 2005 Act addresses the proliferation dimension of the biological weapons threat, it does not establish a dedicated investigative, surveillance or public health response mechanism for an actual bioterrorist attack, a gap that must instead be filled, imperfectly, by the Unlawful Activities (Prevention) Act, 1967 for terrorism-related offences generally, and by the general criminal law, including the Bharatiya Nyaya Sanhita's provisions on the adulteration of food and endangerment of life, none of which were drafted with biological agents specifically in contemplation.[27][28]

Institutional Architecture

India's institutional response to biological threats is distributed across at least half a dozen ministries and agencies without a single nodal authority possessing overarching command. The National Disaster Management Authority, operating under the Disaster Management Act, 2005, is formally responsible for biological disaster guidelines but lacks operational control over the health, defence or intelligence agencies whose cooperation any real bioterrorism response would require.[29][30] The Department of Biotechnology oversees research governance and laboratory safety frameworks, the National Centre for Disease Control manages outbreak surveillance and epidemiological response through the Integrated Disease Surveillance Programme, and the Department of Animal Husbandry and Dairying separately monitors livestock biosecurity and transboundary animal diseases, reflecting a sectoral, rather than unified, approach to what is in substance a single, cross-cutting risk.[31] On the defence side, agencies such as the Defence Research and Development Organisation possess relevant technical capability in detection, decontamination and medical countermeasures, but institutional linkages between this defence-scientific capacity and the civilian public health and disaster management architecture remain limited, with joint simulation exercises involving health, defence and law enforcement agencies reported to be rare rather than routine. India has, as yet, no single central nodal agency charged with coordinating the biosecurity functions currently dispersed across the Ministry of Health and Family Welfare, the Department of Biotechnology, the Ministry of Home Affairs, the Ministry of Defence and State governments, despite policy recommendations that such coordination is essential to an effective response capability.

India And The International Biosecurity Regime

India signed the Biological Weapons Convention in 1972 and ratified it in 1974, becoming an early

adherent to the first multilateral treaty to prohibit an entire category of weapons of mass destruction and to require the destruction of existing stockpiles.[32] India has continued to participate actively in Convention review conferences, consistently advocating for non-discriminatory implementation and capacity-building support for developing countries, and for the Convention to keep pace with rapid advances in biotechnology that raise new dual-use and biosecurity concerns. Notwithstanding this engagement, India has not enacted a single, dedicated statute to implement its Convention obligations domestically, relying instead on the multi-legislative patchwork described in Part V, administered through a network of regulatory bodies including the Department of Biotechnology, the Ministry of Health and Family Welfare and the Defence Research and Development Organisation.[33] India is also associated, in varying degrees, with the Australia Group's informal export control arrangements aimed at preventing the proliferation of chemical and biological weapons, though India is not a formal member of the Group itself. Commentators have suggested that India could strengthen both its domestic compliance posture and its international credibility by establishing a National Biological Weapons Convention Authority and institutionalising annual confidence-building measure reporting through a streamlined national mechanism, steps that would simultaneously address the domestic coordination deficit identified in Part VI and enhance India's standing as a responsible biotechnology power.

Critical Gaps In The Existing Framework

Four structural deficiencies emerge from the preceding analysis. First, jurisdictional fragmentation: biosecurity functions are split across the Union and State Lists, and within the Union, across at least five ministries, with no statute clearly allocating primary responsibility for a deliberate biological attack as opposed to a natural epidemic or an environmental hazard. Second, doctrinal obsolescence: the Epidemic Diseases Act, 1897 remains the default legal instrument for outbreak response despite being conceived for an entirely different threat model, and its 2020 amendment addressed the symptom of violence against healthcare workers rather than the underlying architecture.

Third, the absence of a dedicated biosecurity statute: unlike the position in several comparator jurisdictions discussed in Part IX, India has no single law that defines biosecurity, establishes a unified regulatory authority, and integrates human, animal, plant and environmental health risks within a common framework; the closest analogue, the Weapons of Mass Destruction Act, 2005, addresses proliferation and possession but not detection, response or public health coordination. Fourth, weak dual-use research governance and civil-military-scientific coordination: the 2017 recombinant DNA guidelines and the 1989 Biosafety Rules regulate laboratory conduct but do not extend to a systematic, government-wide assessment of dual-use research of concern, and joint exercises between health, defence and law enforcement agencies remain the exception rather than the rule.

A fifth, cross-cutting concern is constitutional and rights-based: none of the existing statutes adequately specifies the circumstances in which liberty, privacy and property rights may be curtailed in responding to a biological emergency, an omission that risks either an inadequate response, for fear of legal challenge, or an excessive and rights-violative response, for want of statutory guidance, in the event of an actual bioterrorist incident.

Comparative Lessons

A brief comparative survey illustrates the range of institutional choices available to India. China's Biosecurity Law of 2021 treats biotechnology and genetic data as matters of national security, mandating centralised State control over research and material transfers, an approach that maximises State oversight but raises separate concerns regarding scientific openness and international collaboration.[34] Australia's Biosecurity Act of 2015 provides a unified legal framework spanning human, animal and plant sectors, and has been extended to address emerging risks from synthetic biology, offering a model of cross-sectoral integration under a single statute that India conspicuously lacks. The United Kingdom's Biological Security Strategy of 2023 emphasises bio surveillance and rapid response capability, while the European Union's Health Security Framework of 2022, together with Horizon Europe's dual-use research guidelines, embeds biosecurity considerations within a broader 'One Health' model

[32]Convention on the Prohibition of the Development, Production and Stockpiling of Bacteriological (Biological) and Toxin Weapons and on Their Destruction art. I, Apr. 10, 1972, 1015 U.N.T.S. 163.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

that treats human, animal and environmental health as interdependent.

None of these models can be transplanted wholesale into the Indian context, given India's federal structure, its scale and its distinct developmental priorities, but each offers a transferable design principle: unified statutory coverage across sectors, as in Australia; centralised coordination without necessarily sacrificing scientific openness, as China's model illustrates in the negative; and a 'One Health' integration of surveillance systems, as in the European Union, that treats biosecurity as a whole-of-government function rather than a siloed public health, environmental or defence concern.

Towards A Robust Biosecurity Framework: Recommendations

First, Parliament should enact a comprehensive Public Health and Biosecurity Act, relying where necessary on its Article 253 power to implement India's Biological Weapons Convention obligations, to replace the Epidemic Diseases Act, 1897 and to consolidate, within a single instrument, definitions of biosecurity and bioterrorism, graded emergency powers subject to explicit proportionality and due process safeguards, and clear triggers distinguishing a natural outbreak from a suspected deliberate release. Second, the government should establish a dedicated National Biosecurity Authority, or alternatively a National Biological Weapons Convention Authority, to serve as the single nodal agency coordinating the currently dispersed functions of the National Disaster Management Authority, the Department of Biotechnology, the National Centre for Disease Control, the Department of Animal Husbandry and Dairying, and relevant defence and intelligence agencies, with statutory authority to direct joint simulation exercises and to institutionalise India's confidence-building measure reporting under the Biological Weapons Convention.[3536] Third, India should adopt a 'One Health' integration model, following the European Union example, embedding biosecurity risk assessment across human, animal, plant and environmental health intelligence networks, and extending this integration to a nationwide task force examining the emerging convergence of artificial intelligence and biotechnology as a distinct category of biosecurity risk.

Fourth, dual-use research oversight should be strengthened by extending the 2017 recombinant DNA guidelines into a statutory, rather than administrative, regime, with mandatory government-wide review of research that could plausibly be repurposed for hostile use, modelled on but adapted from the Australian and European approaches surveyed in Part IX.[3738]

Fifth, any reform must be anchored in constitutional discipline: emergency powers exercised under a new biosecurity statute should be made explicitly subject to judicial review, sunset clauses and parliamentary oversight, so that the pursuit of biosecurity does not itself become a vector for the erosion of the very Constitutional Guarantees, Under Article 21, That A Viksit Bharat Is Meant To Secure For Its Citizens.

Conclusion

India's pursuit of Viksit Bharat @2047 is premised on a vision of self-reliant economic strength, technological leadership and global influence, but this vision is only as secure as the weakest link in the country's risk-governance architecture. This paper has shown that, on the specific question of bioterrorism and biosecurity, that link remains structurally weak: a colonial-era public health statute, a disaster management framework whose biological guidelines are advisory rather than binding, environmental and biosafety rules never designed for deliberate misuse, a proliferation-focused security statute with no operational response mechanism, and an institutional landscape split across at least half a dozen agencies with no single body in overall command. India's continued and constructive engagement with the Biological Weapons Convention demonstrates the political will to be recognised as a responsible biotechnology power, but political will has not yet translated into the unified domestic legal and institutional architecture that such recognition ultimately requires. The comparative experience of jurisdictions such as Australia, China, the United Kingdom and the European Union demonstrates that unified, cross-sectoral biosecurity statutes and dedicated coordinating authorities are neither unusual nor infeasible; they are, increasingly, the international norm for States that treat biological risk as a first-order security concern. If Viksit Bharat @2047 is to be more than an economic aspiration, and to encompass the resilience and stability that its own architects have identified as one of its four pillars, India must treat the enactment of a comprehensive Public Health and Biosecurity Act and the establishment of a National Biosecurity

Authority not as a distant reform to be revisited after other developmental priorities are met, but as an integral and time-bound component of the journey to 2047 itself.

Abstract

Agro-tourism has increasingly been recognised as a means of diversifying rural livelihoods by connecting agricultural environments, local food systems, rural lifestyles and tourism experiences. In regions with strong indigenous and tribal cultural traditions, festivals can add a distinctive cultural dimension to such tourism by bringing together traditional knowledge, agricultural practices, food, music, dance, crafts and community participation. Palghar district of Maharashtra offers an important setting for examining this relationship because of its agricultural landscape, tribal communities and distinctive cultural heritage, particularly that associated with the Warli community. This paper examines the potential role of tribal festivals in the development of agro-tourism in Palghar district, with particular attention to Tarpa, tribal Diwali and harvest-related celebrations, Holi, Waghbaras, and Warli art-related activities associated with festive periods. The study adopts a descriptive and analytical secondary-data approach, drawing on government publications, tourism-policy documents, academic literature and institutional sources relating to agro-tourism, festival tourism, tribal tourism and community-based tourism. Rather than assuming that all tribal cultural attractions constitute agro-tourism, the paper distinguishes general cultural tourism from tourism activities that carry a direct agricultural connection. The analysis suggests that harvest-linked celebrations hold the strongest potential for integration with agro-tourism, while Tarpa, Holi, Waghbaras and Warli art function as complementary cultural components within a broader rural tourism experience. The paper identifies potential opportunities in local employment, farm-based experiences, traditional food, agricultural-product marketing, handicrafts, guiding and community-based enterprises. At the same time, inadequate infrastructure, accessibility constraints, limited promotion, capacity gaps, uneven benefit distribution, environmental pressure and cultural commodification may restrict sustainable development. A conceptual framework linking cultural resources, tourism experiences, local economic activity and sustainable rural development is proposed. The paper argues that festival-based agro-tourism in Palghar should be community-led, culturally sensitive and agriculturally grounded rather than externally designed as a conventional tourist attraction.

Keywords: *Agro-tourism; Tribal Tourism; Festival Tourism; Palghar; Warli; Rural Development; Cultural Tourism; Community-Based Tourism; Sustainable Tourism*

Introduction

Tourism has become an important component of rural economic diversification and regional development. Rural destinations increasingly draw on agricultural landscapes, local traditions, food systems, crafts and cultural practices to build tourism experiences that complement conventional tourism products. Such approaches are particularly relevant in areas where agriculture remains a central livelihood activity and where cultural heritage is embedded within everyday community life. Agro-tourism represents one such approach. Although the terms agro-tourism, agritourism and rural tourism are sometimes used interchangeably, the literature suggests that agro-tourism should be understood more specifically as tourism associated with agricultural environments and activities.

Website: https://bnir.us

Phillip, Hunter and Blackstock (2010) proposed a typology that distinguishes agritourism according to the relationship between visitors and agricultural activity, including whether the activity takes place on a working farm and whether visitor contact with agriculture is passive, indirect, staged or direct. This distinction is important for the present study. Tribal festivals may hold considerable tourism value, but a festival does not automatically constitute agro-tourism. Its relevance to agro-tourism becomes stronger when the festival is connected to agricultural cycles, harvest practices, farm-based experiences, traditional food systems or agricultural products. Festival tourism offers another useful perspective. Festivals concentrate cultural activities within particular periods and can create opportunities for visitor spending, local entrepreneurship and destination identity. However, festival-related economic benefits are not automatically distributed throughout a community and may be difficult to measure accurately. O'Sullivan and Jackson (2002), for example, examine festival tourism specifically in relation to sustainable local economic development and highlight the complexity of assessing the actual economic value generated by visitor spending. The intersection of these two forms of tourism becomes particularly significant in tribal regions. Tribal festivals often incorporate traditional music, dance, food, crafts, agricultural knowledge and community practices. Such resources may create distinctive visitor experiences while also providing opportunities for local economic participation. However, tourism based on indigenous culture also raises questions of cultural ownership, authenticity, representation and commercialisation. Community-based tourism literature increasingly emphasises local participation, decision-making and control as important conditions for culturally responsible tourism development (Salazar, 2012). Palghar district provides a relevant setting for examining these issues. The district was created on 1 August 2014 through the bifurcation of Thane district and comprises eight talukas: Palghar, Vasai, Dahanu, Talasari, Jawhar, Mokhada, Vikramgad and Wada. Government sources describe the district as combining coastal, rural and hilly/forested environments, while its tribal cultural heritage includes Warli painting and Tarpa dance (Zilla Parishad Palghar, Government of Maharashtra, 2018). The central argument of this paper is that tribal festivals can contribute to agro-tourism development in Palghar, but their contribution depends on the nature of their relationship with agriculture, the participation of local communities, the distribution of tourism benefits and the protection of cultural integrity.

1. Research Problem

Palghar's tribal heritage has received attention in the broader context of tribal and rural tourism. However, the specific relationship between tribal festivals and agro-tourism requires further examination. In particular, there is a need to distinguish cultural tourism based on tribal heritage from agro-tourism that is directly connected to agriculture.

The research problem addressed by this paper is therefore:

How can Palghar's tribal festivals contribute to agriculture-linked tourism and rural livelihood opportunities while maintaining cultural authenticity and community control?

2. Research Gap

Existing literature establishes three relevant areas of knowledge. First, agro-tourism can provide opportunities for agricultural diversification and rural development. Second, festivals can create tourism attractions and local economic activity. Third, indigenous and community-based tourism can contribute to cultural preservation and livelihoods when communities retain meaningful participation and control. Palghar-specific studies have also examined tribal tourism and the district's cultural resources. For example, recent work has discussed opportunities and challenges associated with tribal tourism development in Palghar (Shrimante, Harpale, & Harane, 2024; Telang, 2019). However, the intersection between tribal festivals, agriculture and agro-tourism remains comparatively underdeveloped as a specific analytical theme. This paper addresses that gap by systematically examining the relationship between selected tribal festivals and cultural activities and the development of agriculture-linked tourism in Palghar.

3. Research Objectives

1. To study the tribal festivals of Palghar district and their relevance to tourism.
2. To examine the relationship between tribal festivals and agro-tourism development in Palghar district.
3. To analyse the potential economic opportunities associated with festival-based tourism in the district.
4. To identify the challenges and opportunities for sustainable agro-tourism development based on tribal festivals in Palghar.

4. Research Questions

1. What tribal festivals and cultural practices of Palghar are relevant to tourism?
2. How can tribal festivals contribute to agro-tourism development?
3. What economic opportunities may arise for local and tribal communities?

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

4. What challenges could restrict festival-based agro-tourism development?
5. What strategies can support sustainable and culturally sensitive development?

5. Significance of the Study

The study is relevant to tourism planners, rural-development institutions, farmers, artisans, community organisations and policymakers. It provides a framework through which tribal festivals can be viewed not simply as cultural attractions but as potential components of integrated rural tourism systems. For communities, the approach emphasises participation and benefit-sharing. For farmers, it identifies opportunities to connect agricultural activity and local products with tourism. For artisans, it identifies cultural-product opportunities. For policymakers, it provides a framework for considering cultural heritage, agriculture and tourism together.

Study Area: Palghar District

1. Geographical and Administrative Profile

Palghar district is located in the northern part of Maharashtra's Konkan region. It extends from the Arabian Sea in the west toward the Sahyadri ranges in the east and shares boundaries with Gujarat and neighbouring Maharashtra districts. Government sources report an approximately 112-kilometre coastline and describe the district as having diverse coastal, rural and hilly landscapes (District Palghar, Government of Maharashtra, n.d.). The district was officially created on 1 August 2014 following the separation of eight talukas from Thane district: Palghar, Vasai, Dahanu, Talasari, Jawhar, Mokhada, Vikramgad and Wada (Zilla Parishad Palghar, Government of Maharashtra, 2018). This administrative and geographical diversity is important for tourism planning because coastal areas, agricultural villages, forested landscapes and tribal settlements occur within the same district.

Source- https://commons.wikimedia.org/w/index.php?curid=100831509

Source - https://www.mapsofindia.com/maps/maharashtra/tehsil/palghar-tehsil-map.jpg

2. Agriculture

Agriculture constitutes an important component of the rural landscape of Palghar. The district's geographical diversity supports a range of agricultural and horticultural activities. Government tourism information identifies

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Gholwad in Dahanu taluka as being particularly associated with chikoo (sapodilla) production (District Palghar, Government of Maharashtra, n.d.). For agro-tourism development, agricultural activity is significant not merely as an economic sector but as a potential tourism resource. Farms, orchards, harvesting activities, traditional food preparation and agricultural landscapes can become components of visitor experiences when appropriately managed.

3. Tribal Communities and Cultural Heritage

Palghar has a significant tribal presence, particularly in its interior and northern areas. Government tourism sources identify Warli, Katkari and Malhar Koli among the district's communities, while other institutional sources document the presence of Warli and Konkana communities in the region (Maharashtra Tourism Development Corporation, n.d.). Warli cultural heritage is particularly prominent. Warli painting represents aspects of community life, nature and everyday activities, while Tarpa dance is an important cultural expression associated with the Warli community. The Ministry of Tribal Affairs' Adi Kalakar portal specifically identifies Tarpa dance as a Warli tradition and documents its association with harvest and community life in Palghar (Ministry of Tribal Affairs, Government of India, 2023). The combination of agriculture, tribal settlement patterns and cultural heritage provides a potentially important foundation for community-based agro-tourism.

Review of Literature

1. Agro-Tourism and Rural Development

Agro-tourism connects tourism activity with agricultural environments and farm-related experiences. Phillip, Hunter and Blackstock (2010) emphasise the importance of clearly identifying the degree of visitor interaction with agricultural activity when defining agritourism. This conceptual distinction is particularly relevant to Palghar. A visitor attending a tribal dance performance is participating primarily in cultural tourism. A visitor who attends a harvest celebration, visits a farm, participates in agricultural activity, consumes locally produced food and purchases farm products is participating in an experience with a stronger agro-tourism dimension. Maharashtra has also developed a formal policy framework for agro-tourism. The state's 2020 Agri-Tourism Policy describes agro-tourism as an agriculture-related business opportunity and promotes rural development through activities associated with agriculture and allied sectors (Government of Maharashtra, 2020).

The state's more recent tourism policy also recognises agro-tourism as an agri-business activity and provides for agricultural-product and handicraft sales to tourists, training and other forms of support (Government of Maharashtra, Directorate of Tourism, 2025).

2. Festival Tourism

Festivals can create temporary concentrations of cultural activity, visitors and local expenditure. O'Sullivan and Jackson (2002) argue that festival tourism can contribute to local economic development, while also noting the difficulty of measuring the actual value of visitor expenditure. For rural communities, festivals may create opportunities for food vendors, artisans, accommodation providers, transport operators and local guides. However, because festivals are usually seasonal, they cannot necessarily provide stable year-round income by themselves. Consequently, the development of festival-based agro-tourism should connect festival periods with complementary rural experiences before and after the festival.

3. Indigenous and Community-Based Tourism

Indigenous tourism can contribute to cultural visibility and economic diversification, but it may also create risks of commodification and cultural appropriation. Recent research on community-based indigenous tourism emphasises the importance of indigenous voices, traditional institutions, cultural memory and self-determination in tourism development (Shrestha, L'Espoir Decosta, & Whitford, 2025). Community-based cultural tourism research similarly highlights issues relating to local participation, guide training, quality control and power relationships between communities and external tourism actors (Salazar, 2012).

These findings suggest that tribal tourism should not simply use culture as a tourism commodity. Instead, local communities should participate in determining which cultural elements are shared, how they are represented and how economic benefits are distributed.

4. Cultural Preservation and Commercialisation

Tourism can contribute to the preservation of cultural practices by creating economic and social incentives for their continuation. At the same time, tourism can transform cultural practices when performances are modified primarily to meet tourist expectations. Research on indigenous tourism has demonstrated that tourism projects can produce unequal benefits and reinforce existing social inequalities when governance mechanisms are weak (Taylor, 2017). Therefore, cultural preservation should be treated as an active

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

component of tourism planning rather than as an automatic outcome of tourism development.

5. Palghar and Tribal Tourism

Recent research on Palghar identifies opportunities for tribal tourism based on the district's cultural heritage and natural environment while also identifying challenges associated with infrastructure, accessibility, awareness and development (Shrimante, Harpale, & Harane, 2024; Telang, 2019). Government tourism sources similarly identify Warli painting and Tarpa dance as important cultural resources and describe Jawhar and other parts of the district as locations where visitors can experience tribal culture (Maharashtra Tourism Development Corporation, n.d.).

The existing evidence establishes Palghar as a relevant setting for tribal and rural tourism. The present study narrows the focus further to the relationship between festivals, agricultural experiences and agro-tourism.

Research Methodology

1. Research Design

The study adopts a descriptive and analytical research design based primarily on secondary data.

The descriptive component identifies and characterises selected tribal festivals and cultural practices relevant to tourism in Palghar. The analytical component examines their potential relationship with agro-tourism, rural livelihoods, cultural preservation and sustainable development.

The study does not claim statistically measured economic or tourism impacts because verified visitor, income or employment datasets specific to these festival activities were not available within the evidence base examined.

2. Sources of Data

1. Government of Maharashtra tourism and policy documents;
2. District Palghar government publications;
3. Ministry of Tribal Affairs cultural documentation;
4. Census-related demographic information;
5. Academic journal articles;
6. Conference papers;
7. Research on agro-tourism, rural tourism, festival tourism and indigenous tourism;
8. Institutional publications relating to tribal development and tourism.

3. Analytical Approach

The analytical approach provides a systematic framework for examining the role of tribal festivals and cultural activities in the development of agro-tourism. Since festivals are not only cultural events but are also connected with agriculture, local livelihoods, traditional knowledge, handicrafts, food, and rural landscapes, each selected festival or cultural activity should be assessed from multiple perspectives. For the present study, the selected festivals and cultural activities were analysed using six major dimensions.

1. Cultural importance;
2. Connection with agriculture;
3. Tourism relevance;
4. Potential local economic opportunities;
5. Cultural-preservation potential;
6. Sustainability risks.

Tribal Festivals and Cultural Practices Relevant to Agro-Tourism

Table 1. Festival and Cultural Resource Mapping

Festival / Cultural Activity	Primary Cultural Association	Agricultural / Rural Connection	Tourism Relevance	Potential Local Opportunity	Key Sustainability Concern
Tarpa	Warli	Strong association with community and harvest traditions	Dance, music and cultural experience	Performances, local guiding, instrument-making	Staging and cultural commodification
Diwali / Harvest Celebrations	Warli, Kokna/Konkana and other rural communities	Direct relationship with seasonal agricultural life where locally practised	Farm and harvest experiences	Farm stays, food, agricultural products	Seasonality
Holi	Multiple tribal communities	Seasonal and rural-community context	Participatory cultural experience	Hospitality, food and craft sales	Uncontrolled visitor pressure
Waghbaras	Tribal communities associated with forest/nature	Forest, livestock and rural environmental interface	Eco-cultural experience	Guiding and interpretation	Ritual sensitivity and carrying capacity

Festival / Cultural Activity	Primary Cultural Association	Agricultural / Rural Connection	Tourism Relevance	Potential Local Opportunity	Key Sustainability Concern
	traditions				
Warli Art Activities	Warli	Agricultural and communal themes represented in visual art	Cultural and handicraft tourism	Artwork and craft sales, demonstrations	Commercial reproduction and design dilution

1. Tarpa

Tarpa is one of the most recognisable cultural expressions associated with the Warli community. It involves a circular community dance accompanied by the Tarpa wind instrument. Government and Ministry of Tribal Affairs cultural documentation identifies Tarpa as a Warli tradition and explicitly connects its performance with harvest and agricultural community life (Ministry of Tribal Affairs, Government of India, 2023). Its tourism relevance lies in its combination of music, movement, community participation and distinctive cultural identity. Tarpa therefore provides an important cultural component for a rural tourism experience. From an agro-tourism perspective, however, its strongest value emerges when the dance is presented within its agricultural and community context rather than as an isolated stage performance.

Source - https://www.indianetzone.com/images/Dance_of Dadra and_Nagar_Haveli.jpg

2. Diwali and Harvest-Related Celebrations

Harvest-related celebrations provide the most direct conceptual connection between tribal festivals and agro-tourism.Where local traditions associate Diwali celebrations with agricultural prosperity and the completion of an agricultural cycle, festival periods could be connected with farm visits, traditional food, harvesting activities and agricultural-product markets. This approach would transform the festival from a single cultural attraction into a broader rural experience:

Festival → Farm → Harvest → Traditional Food → Local Products → Community Experience

The agricultural connection should nevertheless be understood as community-specific rather than assumed to be identical across all tribal communities in Palghar.

3. Holi

Holi is celebrated widely across India, but tribal communities may incorporate distinctive local forms of music, dance, social participation and ritual. Its relevance to tourism lies primarily in cultural participation rather than in a clearly established agricultural function. Within the framework of this study, Holi is therefore better regarded as a complementary cultural-tourism resource that can be integrated into a larger agro-tourism circuit where appropriate. Any tourism development around the festival should avoid excessive visitor concentration or changes to community practices solely for tourist consumption.

4. Waghbaras

Waghbaras is also known as Vasubaras and it included in the original study framework as a tribal cultural practice associated with nature, animals

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

and forests. Its potential tourism relevance lies more strongly in eco-cultural tourism than in agro-tourism. It could therefore complement agricultural tourism through interpretation of the relationships between forests, livestock, land and community life. Because ritual practices can carry meanings not intended for public or commercial presentation, tourism planning should involve community representatives in determining which aspects can appropriately be interpreted for visitors.

5. Warli Art and Festival-Related Cultural Activities

Warli painting is not a festival itself and should therefore be treated as a festival-associated cultural activity rather than categorised as a festival. Government tourism sources identify Warli painting as a major element of Palghar's cultural heritage (Maharashtra Tourism Development Corporation, n.d.). The visual language of Warli art includes representations of everyday activities, community life, nature and agricultural themes. This creates an important link with rural tourism and provides opportunities for demonstrations, workshops and direct purchase of artwork. However, tourism promotion should avoid uncontrolled reproduction of Warli designs that reduces cultural meaning to a generic commercial pattern.

Role of Tribal Festivals in Agro-Tourism Development

1. Cultural Attraction

Tribal festivals can provide tourism experiences based on music, dance, food, crafts, traditional knowledge and community interaction. Unlike constructed tourist attractions, such experiences are embedded in local culture. Their distinctiveness may therefore contribute to destination identity and diversify Palghar's tourism offering. However, the cultural attraction should not be separated from its community context. The value of a festival is not simply its visual appeal to visitors but its significance to the people who practise it.

2. Integration with Agricultural Experiences

The distinction between cultural tourism and agro-tourism is central to this study. A visitor attending a Tarpa performance is primarily engaging in cultural tourism. A visitor attending a harvest celebration and subsequently participating in harvesting, visiting a farm, consuming locally produced food and purchasing agricultural products is engaging with agro-tourism more directly.

This suggests a two-level model:

Primary agro-tourism resources:

Agriculture → Farm visits → Harvesting → Local food → Agricultural products

Complementary cultural resources:

Festivals → Dance → Music → Art → Traditional knowledge → Community interaction

The strongest development opportunity lies in combining these two systems without incorrectly labelling every cultural activity as agro-tourism.

3. Employment Opportunities

Festival-linked agro-tourism has considerable potential to generate direct, indirect, and seasonal employment opportunities for rural communities. Tribal festivals and cultural events attract visitors who require accommodation, food, transportation, guiding, entertainment, local products, and other tourism-related services. As a result, tourism expenditure can circulate within the local economy and provide supplementary sources of livelihood to farmers, tribal households, women, youth, artisans, performers, and small entrepreneurs.

4. Promotion of Local Products

Tourism can create a direct connection between local production and visitor consumption. A possible value chain is:

Farmer / Artisan → Festival or Farm Experience → Tourist Interaction → Product Purchase → Local Revenue

Agricultural produce, traditional food and Warli artwork could therefore become part of an integrated tourism offering. Maharashtra's tourism policy framework explicitly recognises the potential for farmers involved in agro-tourism to sell agricultural produce, local products and handicrafts to visitors (Government of Maharashtra, Directorate of Tourism, 2025).

5. Local Entrepreneurship

Festival-based tourism could support small-scale entrepreneurship among farmers, artisans, food producers, guides, transport providers and accommodation operators.

6. Cultural Preservation

Young community members may gain economic and social reasons to continue learning traditional art, music, dance and craft practices.

However, preservation should not mean freezing culture in an artificial form for tourists. Cultural practices naturally evolve, and communities should retain the right to determine how their traditions are represented.

7. Sustainable Rural Development

Festival-based agro-tourism can contribute to sustainable rural development only when economic, social, cultural and environmental dimensions are considered together. Economic development without cultural protection may result in commodification. Cultural promotion without local economic benefit may provide little livelihood value. Tourism growth without environmental management may create waste and resource

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

pressure. Therefore, sustainability requires an integrated approach.

Challenges to Festival-Based Agro-Tourism Development

1. Infrastructure

Accommodation, sanitation, visitor facilities, signage, waste management and basic tourism infrastructure are important requirements for developing rural tourism. Interior tribal villages may face greater infrastructure constraints than established tourist centres.

2. Transport and Accessibility

Poor accessibility can restrict tourism demand even when a destination possesses significant cultural resources. Roads and last-mile connectivity are particularly important for villages that may be incorporated into festival-based tourism circuits.

3. Marketing and Awareness

Palghar is already promoted for beaches, forts, waterfalls, hill destinations and other attractions. Its tribal festivals and agriculture-linked cultural experiences could be promoted more systematically as part of the district's rural tourism identity. Government tourism information already highlights Tarpa, Warli painting and tribal cultural experiences as elements of the district's heritage (Maharashtra Tourism Development Corporation, n.d.).

4. Community Capacity

Community participation requires skills in hospitality, tourism management, guiding, hygiene, entrepreneurship, accounting and digital marketing. Capacity building is therefore not an optional addition but an important requirement for ensuring that local communities can capture a meaningful share of tourism value.

5. Institutional Support

Maharashtra already has a policy framework supporting agro-tourism. The state's Agri-Tourism Policy identifies rural development and agricultural diversification as important objectives (Government of Maharashtra, 2020). The challenge is to translate this broader policy framework into locally appropriate models that connect agriculture with tribal cultural heritage while respecting community priorities.

6. Commercialisation and Cultural Authenticity

Commercialisation represents one of the most significant risks.

If external tourism operators determine what cultural activities should be performed, when they should occur and how they should be presented, the community may gradually lose control over its cultural representation. Research on community-based and indigenous tourism demonstrates that tourism can reproduce unequal power relationships when local communities do not have meaningful control (Taylor, 2017).

7. Environmental Pressure

Festival tourism can generate concentrated visitor pressure over a short period. Potential impacts include waste generation, traffic, water consumption and disturbance of agricultural or forest environments. Consequently, visitor capacity, waste management and environmental safeguards should be assessed before tourism numbers are deliberately increased.

Opportunities and Sustainable Development Strategies

1. Community-Based Tourism

The most appropriate development model for Palghar is a community-based approach in which tribal communities participate in planning, management and benefit distribution.

Recent indigenous-tourism research similarly emphasises community voice, cultural empowerment and self-determination (Shrestha, L'Espoir Decosta, & Whitford, 2025).

2. Festival-Based Agro-Tourism Circuits

A potential conceptual circuit is:

Festival → Tribal Village → Farm → Harvest Experience → Traditional Food → Warli Art → Local Products → Nature/Cultural Experience

The proposed circuit should not be understood as an existing tourism route. It represents a development model that could be tested through future field research.

3. Local Product Development

Local product development is an important component of agro-tourism and rural tourism. Tourism packages can promote locally available products by creating opportunities for tourists to experience, purchase, and learn about the unique agricultural, cultural, and traditional products of the region. This can generate additional income and employment for local communities.

4. Capacity Building

Capacity building is an essential component for the successful development and management of agro-tourism and rural tourism. Capacity building through systematic training programmes can strengthen the skills and confidence of local communities and improve the quality of tourism services. The participation of local communities is necessary for providing quality tourism services and ensuring that tourism activities generate sustainable economic and social benefits. Therefore, farmers, local residents, women, youth, artisans, homestay owners, and tourism service providers should be provided with appropriate training and skill development programmes like Hospitality, Homestay management Entrepreneurship, Waste management etc.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

5. Cultural Safeguarding

Cultural safeguarding refers to the protection, preservation, and respectful promotion of the cultural heritage, traditions, beliefs, customs, art forms, and knowledge systems of local and indigenous communities. In the context agro-tourism development, cultural safeguarding is essential to ensure that tourism does not lead to the exploitation, misrepresentation, commercialization, or loss of traditional culture.

A cultural-safeguarding framework should establish:

1. Community approval for tourism activities;
2. Identification of sacred or restricted practices;
3. Rules for photography and recording;
4. Community control over cultural interpretation;

6. Infrastructure Development

Infrastructure development is an essential component of sustainable rural and agro-tourism development. However, infrastructure in rural tourism destinations should be developed carefully in ways that support local communities and tourism activities without transforming the original character of rural settlements. Large-scale construction, excessive commercialization, and inappropriate urban-style development may negatively affect the natural environment, agricultural land, traditional architecture, and cultural identity of rural areas. Therefore, infrastructure development should focus on improving basic facilities, accessibility, safety, cleanliness, and visitor convenience while maintaining the authenticity and sustainability of rural settlements.

Conceptual Framework

The study proposes the following conceptual framework for festival-based agro-tourism development in Palghar:

Cultural and Agricultural Resources

Tribal festivals + Traditional knowledge + Agricultural practices + Local food + Warli art + Agricultural products

↓

Tourism Experiences

Cultural participation + Farm experience + Harvest experience + Food experience + Art/craft experience

↓

Tourism Activities

Visitor attraction + Local spending + Community participation + Product sales

↓

Potential Outcomes

Employment opportunities + Local entrepreneurship + Agricultural-product promotion + Cultural visibility + Knowledge transmission

↓

Sustainable Rural Development

Economic diversification + Social inclusion + Cultural conservation + Environmental responsibility

Cross-Cutting Conditions:

Community participation | Infrastructure | Government support | Responsible marketing | Cultural safeguarding | Environmental management

The framework is conceptual and has not been statistically tested. Its purpose is to provide a structure for future empirical research.

Discussion

1. Tribal Festivals as Tourism Resources

The analysis demonstrates that Palghar possesses a diverse set of cultural resources that can potentially contribute to tourism. Tarpa provides a performance-oriented cultural experience, harvest celebrations provide a stronger agricultural connection, Holi provides a community-based cultural experience, Wagh baras provides an eco-cultural dimension, and Warli art provides a craft and visual-heritage component. This diversity is valuable because it reduces dependence on a single cultural attraction.

2. The Festival–Agriculture–Tourism Relationship

The analysis also indicates that not every tribal festival should automatically be classified as agro-tourism.This distinction is one of the principal contributions of the paper. Agro-tourism requires a meaningful relationship with agricultural activity (Phillip, Hunter, & Blackstock, 2010). Consequently, harvest-linked celebrations represent the most direct opportunity, while Tarpa, Holi, Waghbaras and Warli art can strengthen a wider rural tourism circuit. This conceptual distinction can help prevent the overuse of the term 'agro-tourism' for tourism products that are primarily cultural.

3. Economic Opportunities

Festival-based tourism may create opportunities for local employment and entrepreneurship through accommodation, food, guiding, transportation, cultural performances, crafts and agricultural-product sales. However, these should be regarded as potential economic pathways rather than measured impacts. The actual distribution of tourism income can only be established through household surveys, visitor expenditure studies and enterprise-level research. Festival tourism research also suggests that measuring visitor expenditure and its local economic value can be complex (O'Sullivan & Jackson, 2002).

4. Cultural Preservation

Tourism can support cultural continuity when cultural knowledge becomes valued by both community members and visitors. Warli painting and Tarpa already demonstrate how cultural

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

practices can represent community identity while also functioning as tourism resources (Ministry of Tribal Affairs, Government of India, 2023). Nevertheless, cultural preservation should not be treated as an automatic consequence of tourism. The form of tourism governance is critical.

5. Community Participation

The literature strongly supports the importance of community participation and control in indigenous tourism. Community-based indigenous tourism research highlights cultural empowerment, self-determination and the role of indigenous knowledge in shaping tourism development (Shrestha, L'Espoir Decosta, & Whitford, 2025).

For Palghar, this suggests that the central question is not simply whether tribal festivals can attract tourists, but who controls the tourism experience and who receives the resulting benefits.

6. Sustainability

Sustainability is a fundamental principle for the successful development of festival-based agro-tourism. A sustainable festival-agro-tourism model should not focus only on attracting a large number of tourists or generating short-term economic benefits. Instead, it should create a balanced relationship between economic development, social well-being, cultural preservation, and environmental protection. Festival-agro-tourism brings together agriculture, rural traditions, local festivals, cultural practices, food, handicrafts, and tourism activities. Therefore, its development should ensure that tourism benefits local communities while protecting the natural environment and preserving the cultural identity of the region.

7. Commercialisation Risk

The development of tribal tourism creates a tension between economic opportunity and cultural integrity. Commercialisation can provide income for artists and performers, but uncontrolled commercialisation can also alter cultural meaning. Indigenous tourism research documents both the potential of tourism to empower communities and the possibility of commodification and unequal control (Shrestha, L'Espoir Decosta, & Whitford, 2025).

For Palghar, community-defined cultural boundaries should therefore be treated as a prerequisite for responsible tourism development.

Policy and Development Implications

1. For Government

Government agencies should consider integrating tribal cultural resources into rural and agro-tourism planning while maintaining community participation. Possible interventions include infrastructure development, community training, festival documentation, support for registered agro-tourism enterprises, local-product promotion, cultural-safeguarding guidelines etc.

Maharashtra's existing agro-tourism policy provides an institutional basis for linking agricultural activities with tourism (Government of Maharashtra, 2020).

2. For Tribal Communities

For the sustainable development of tribal and agro-tourism, tribal communities should be positioned as decision-makers rather than merely as performers, workers, or tourism labourers. Since tribal communities are the custodians of their culture, traditions, festivals, natural resources, and sacred places, they should have the authority to participate actively in planning, managing, and regulating tourism activities. Community organisations, village committees, tribal associations, and local self-help groups can establish rules and guidelines regarding some important aspects like visitor access, photography, cultural performances, sacred practices, pricing, revenue sharing, environmental management etc.

3. For Farmers

Farmers could potentially connect festival periods with farm-based experiences, particularly during harvest-related periods. Possible products include farm visits, harvesting demonstrations, traditional food experiences and direct agricultural-product sales.

4. For Artisans

Warli artists and other artisans may benefit from direct tourism markets through demonstrations, workshops and authentic product sales.

At the same time, systems should discourage unauthorised reproduction and excessive commercial simplification of traditional designs.

5. For Tourism Operators

Tour operators should develop experiences in partnership with communities rather than simply packaging cultural practices for external consumption.

Local sourcing, transparent revenue-sharing and culturally responsible interpretation should be incorporated into tourism operations.

Limitations of the Study

The study has several limitations.

First, it is primarily a descriptive and analytical secondary-data study and does not provide statistically verified primary evidence from tribal households or tourists. Second, no quantitative estimates of festival-related visitor expenditure, employment generation or household income are presented. Third, the cultural and agricultural meanings of festivals may vary between communities and localities within Palghar.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Generalisation across all tribal communities should therefore be avoided. Fourth, the study focuses on the festivals and cultural activities identified in the original research framework and does not attempt to provide a complete inventory of Palghar's tribal cultural heritage. Finally, the proposed conceptual framework has not yet been empirically tested.
These limitations do not invalidate the study's conceptual contribution but indicate the need for primary field research.

Conclusion

This paper examined the potential relationship between tribal festivals and agro-tourism development in Palghar district, Maharashtra. The analysis demonstrates that the district's tribal cultural heritage, agricultural landscape and rural communities provide a potentially valuable foundation for an integrated tourism model. The central finding is that tribal festivals should not automatically be treated as agro-tourism activities. Their relevance to agro-tourism depends on the extent to which they are connected to agricultural environments, seasonal farming activities, local food systems, farm-based experiences and agricultural products. Among the cultural resources examined, harvest-related celebrations provide the most direct conceptual connection to agro-tourism. Tarpa, Holi, Waghbaras and Warli art can provide complementary cultural, experiential and ecological dimensions within a broader rural tourism circuit. The potential economic contribution of festival-based agro-tourism lies in diversified livelihood opportunities involving farmers, artisans, performers, food producers, guides, transport providers and homestay operators. However, these opportunities should not be interpreted as demonstrated economic impacts without primary data. The sustainability of such tourism depends fundamentally on community participation and cultural governance. Tourism should not transform tribal culture into a product designed primarily around external visitor expectations. Instead, communities should retain meaningful authority over cultural representation, visitor access, benefit distribution and the protection of sacred or sensitive practices. The proposed festival–agriculture–tourism framework therefore positions tribal festivals not as isolated attractions but as potential components of a wider rural development system:

Culture + Agriculture + Community + Tourism → Local Economic Opportunities → Sustainable Rural Development

For Palghar, the objective should not simply be to increase tourist numbers. The more appropriate objective is to develop a community-based, agriculture-linked and culturally responsible tourism model in which tourism strengthens existing rural livelihoods and cultural traditions rather than replacing or exploiting them.

Acknowledgement

I would like to express my sincere gratitude to all those who supported and encouraged me in completing this research paper entitled "Tribal Festivals and Agro-Tourism Development in Palghar District, Maharashtra: Opportunities and Challenges." I am deeply thankful to my institution and colleagues for their valuable guidance, encouragement, and academic support throughout the preparation of this study.

Financial support and Sponsorship

Abstract

The intertidal zones of the western Indian coast are ecologically rich habitats where macroalgae serve as key structural elements, supporting diverse faunal assemblages. This study aimed to assess the diversity and abundance of macroalgae-associated fauna along the rocky intertidal stretch of Bhuigaon Beach, located in Vasai, Palghar District, Maharashtra. Field surveys were conducted during the lowest low tides of April, May, and June 2025, using a 1 m² quadrat sampling method across vertical tidal gradients. A total of 18 faunal species were recorded, predominantly from the phyla Mollusca, Arthropoda, and Cnidaria. Species such as Nerita, Clibanarius infraspinatus, and Pennaria disticha were the most abundant, while others like Doriospella and Amphipods were limited in occurrence. The associated macroalgae observed at the site—Sargassum, Ulva, and Enteromorpha—appear to influence faunal composition by offering food, substrate, and shelter, aligning with earlier findings on the role of macroalgae in enhancing intertidal biodiversity (Azhagu et al., 2017; Apte et al., 2010). One-way ANOVA revealed significant differences in species abundance across taxa ($F(17,36) = 4.61$, $p < 0.001$), indicating non-random distribution patterns. Abundance declined notably in June, likely due to early monsoon conditions, reduced visibility, and seasonal breeding behavior among decapods and gastropods (Bhave & Apte, 2011; Datta et al., 2010). These temporal shifts highlight the need for seasonally distributed biodiversity assessments to account for phenological variation. This study not only documents the underexplored faunal richness of Bhuigaon Beach but also emphasizes the ecological importance of macroalgal habitats in supporting intertidal biodiversity. The baseline information generated through this study can contribute to future ecological monitoring, conservation and sustainable management of coastal ecosystems. Sustainable coastal development requires the conservation of biodiversity and ecological functions of such habitats, making localized biodiversity assessments important for long-term coastal planning and management.

Introduction

Marine and freshwater ecosystems are complex webs of life, where primary producers such as algae form the foundation of aquatic food webs. Algae, ranging from microscopic phytoplankton to macroscopic seaweeds, play important roles in carbon fixation, oxygen production, and habitat provision (Falkowski et al., 2003). Beyond their role as primary producers, algae create microenvironments that support diverse associated fauna and contribute to nutrient cycling, energy flow, and biodiversity. Macroalgae, in particular, form complex three-dimensional structures that provide shelter, food, and breeding grounds for a wide range of invertebrates and fish (Mann, 1973). These highly productive habitats support diverse faunal communities, with the structural complexity, surface area, and morphology of macroalgae influencing the diversity and abundance of associated organisms (Graham et al., 2007; Beck, 2000). Different algal species also provide varying food resources and microhabitats, thereby influencing the composition of associated faunal communities.

Website: https://bnir.us

The fauna associated with algae encompass a broad range of organisms, particularly crustaceans, mollusks, polychaetes, bryozoans, and other invertebrates (Giere, 2009). These organisms contribute to grazing, predation, decomposition, nutrient cycling, and energy transfer within aquatic ecosystems. The interactions between algae and their associated fauna are therefore complex and include trophic, competitive, and symbiotic relationships. While moderate grazing can contribute to nutrient turnover and algal community dynamics, excessive grazing and other ecological pressures may affect algal biomass and associated communities (Carpenter et al., 2001; Connell, 1983).

The study of algae-associated fauna is important for understanding aquatic ecosystem functioning, biodiversity maintenance, and ecosystem health. Their diversity and abundance can provide useful information about environmental conditions and habitat changes. Associated fauna also contribute to commercially important resources, including shellfish and fish used for human consumption and aquaculture (FAO, 2022). Therefore, understanding and documenting algal-associated communities is important not only for biodiversity conservation but also for sustainable management of coastal resources. Establishing baseline information on species diversity and abundance can provide a foundation for future ecological monitoring, conservation planning, and sustainable development of coastal areas. Some coastal regions have attracted considerably more research attention than others, often leaving lesser-known or less accessible areas underrepresented in biodiversity studies (Mantri et al., 2020). One such area is the picturesque and relatively undisturbed Bhuigaon Beach, located in the Palghar district near Mumbai's urban coastline. This small rocky shoreline remains largely unexplored, particularly in terms of macroalgal diversity. The region is also home to several freshwater bodies, and a previous investigation recorded 23 species of microalgae from this locale (Pandey & Kejariwal, 2019). The present study focuses on this site to assess the diversity of fauna associated with the macroalgae and to establish baseline information that can contribute to future conservation and sustainable management of the coastal habitat. Bhuigaon is situated in Vasai Taluka of Palghar District, Maharashtra, along the western coast of India. It is located approximately 80 kilometers from Churchgate and about 50 kilometers from the international airport. Geographically, it lies at coordinates 19.380469° N and 72.757434° E. The beach primarily features sandy terrain and forms a coastal link between the Vasai and Virar regions. A notable feature is a small rocky segment on the beach.

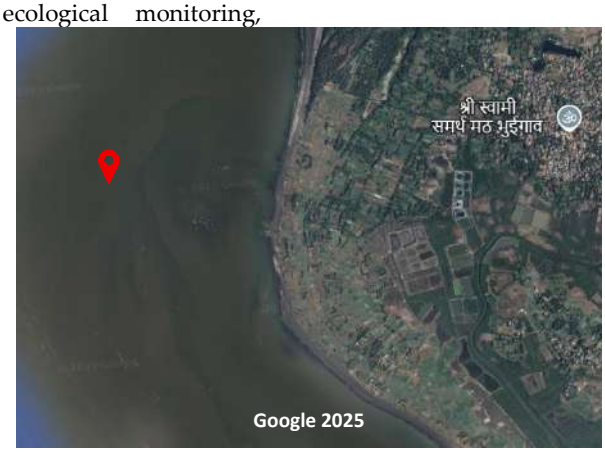

Fig. 1 Bhuigaon beach: Red location mark indicating the rocky intertidal patch. Source: Google earth.

Aim

To understand the structure and functioning of intertidal community and contribute baseline data for future ecological monitoring, conservation and sustainable management efforts.

Objective

To understand the structure and functioning of intertidal community and contribute baseline data for future ecological monitoring and conservation efforts.

To identify and document the species diversity of algae and fauna associated with the algal communities present at Bhuigaon Beach.

To analyze the distribution patterns of algae and associated fauna along the intertidal zone.

To assess the relationship between algal community structure and the associated faunal assemblages.

To highlight the importance of macroalgal-associated biodiversity in supporting sustainable management and conservation of coastal ecosystems.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Review of Literature

Marine macroalgae, particularly in intertidal ecosystems, are recognized as key habitat-forming species that enhance biodiversity by providing substrate, shelter, and food to a wide array of associated fauna. The structural complexity and spatial distribution of macroalgal beds influence the composition and abundance of invertebrates and other marine organisms, making them critical components of coastal ecological networks (Falkowski et al., 2003; Carpenter et al., 2001). Studies across different coastal regions of India have highlighted the ecological importance of macroalgae in supporting diverse faunal assemblages. Azhagu et al. (2017), in their study of Chaetomorpha aerea in the Pulicat estuary, observed a rich diversity of associated invertebrates, including crustaceans, mollusks, and polychaetes. Their findings emphasized that the type of algal species and the nature of the substrate significantly affect the distribution and abundance of associated fauna. Similarly, macrofaunal communities associated with macroalgae in Arctic fjords, such as those studied in Kongsfjord (Spitsbergen), further support the role of algae in structuring benthic communities even under extreme climatic conditions (Polar Biology, 2001). In the Indian context, Bhave, Apte, and colleagues have extensively documented the macrofaunal biodiversity of the western coastline. A notable study by Patel et al. (2021) reported the endemic heterobranch Sakuraeolis gujaratica from the Gujarat coast, underscoring the specificity of algal-invertebrate associations and the significance of region-specific biodiversity assessments. Closer to the study area, Datta et al. (2010) conducted comparative assessments of intertidal fauna along various Mumbai beaches, including Bandstand and Versova. These studies highlighted that rocky intertidal zones with algal cover harbored higher faunal richness compared to sandy or polluted areas. In particular, the presence of species such as crabs, gastropods, and amphipods was strongly correlated with algal mats and microhabitats formed by macroalgal growth (Datta et al., 2010a; 2010b). Chhapgar (1957) provided early baseline data on marine crabs of the Bombay region, cataloging species that are still frequently encountered in algal-dominated shorelines. These foundational works have since been built upon by newer ecological surveys that incorporate environmental stressors and anthropogenic influences, such as eutrophication and nutrient runoff (Carpenter et al., 2001). Globally, the importance of macroalgae-associated communities extends to ecosystem services such as fisheries enhancement, carbon sequestration, and nutrient cycling. The Food and Agriculture Organization (FAO, 2022) recognizes macroalgae habitats as essential nursery grounds for juvenile stages of many commercial species, further supporting their conservation relevance. Moreover, bivalves and filter feeders such as oysters and mussels — often associated with macroalgae-covered zones — contribute to water purification and ecological balance (Dame, 2011). Taken together, the literature strongly supports the view that macroalgae are indispensable ecological engineers in intertidal ecosystems, particularly in tropical and subtropical coastal habitats like the western Indian coastline. However, despite extensive work on the broader regional scale, specific locations such as Bhuigaon Beach remain underexplored. This gap underscores the need for localized studies to document biodiversity, understand faunal-algal associations, and assess environmental health in these transitional habitats.

Materials and Methods

A preliminary survey of the site was done before actually starting with the collection and statistical analysis. Tide time were analyzed and the lowest low tide during the daytime was selected as the preferred time of sample collection.

Study Area

The site selected is a rocky patch of Bhuigaon beach, Palghar district about 9 km from Vasai Road railway station which is a closest railway station on western railway. The site shows various rocky patches spread between Bhuigaon and Rangaon village area of Vasai Taluka.

Fieldwork was conducted during periods of the lowest low tide to ensure maximum exposure of the intertidal zone for sampling. The location of the rocky area is marked with a red location symbol in Fig. 1. Tide timings were selected based on median values to capture the lowest tidal phase, as referenced from Tide Times and Tide Chart for Mumbai.

Table 1: Date of site visit

B Quadrat Analysis

The quadrat method was employed to systematically assess the diversity and distribution of macroalgae and their associated fauna along the intertidal zone. A quadrat frame measuring 1 × 1 meters (i.e., 1 m² in area) was used, constructed from durable PVC to maintain shape (Azhagu et al., 2017; Magurran, 2004). This size is commonly used in intertidal ecological studies as it provides a balance between manageable sampling effort and adequate spatial resolution for detecting small-scale variability in benthic communities (Clarke & Warwick, 2001). Quadrats were placed randomly across the vertical stretch of the rocky intertidal zone during the lowest low tide period. A total of 5 replicate quadrats were sampled during each field visit. Within each quadrat, all visible macroalgae were identified, and associated fauna were collected using gentle brushing, sieving, and visual inspection techniques. The collected specimens were preserved in 4% formalin and transported to the laboratory for further taxonomic identification.

C. Collection of sample

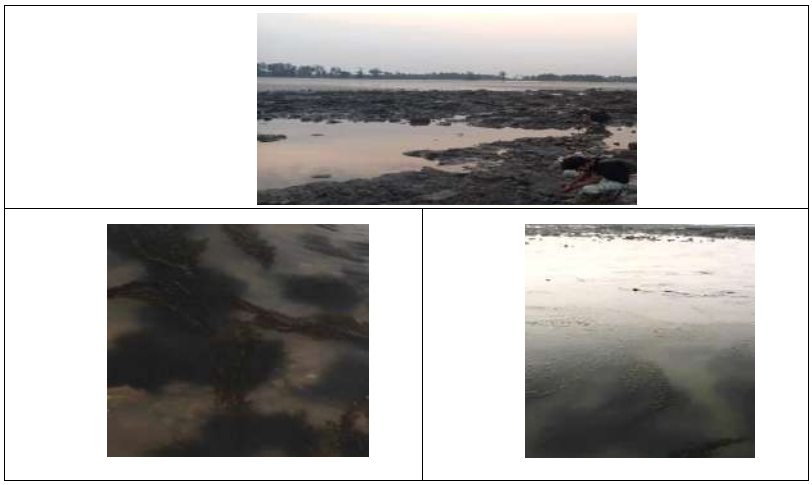

Fig. 2. Site visits for field data collection were conducted during low tide events of each month.

Statistical Analysis

The data collected on macroalgae and associated fauna over the three-month period (April–June 2025) was subjected to quantitative analysis to assess patterns of species diversity, abundance, and along the intertidal zone of Bhuigaon Beach. Sampling data were organized month-wise and species-wise into a structured matrix using Google sheets. Descriptive statistics including mean, variance, and standard deviation were computed to understand the basic distribution characteristics of species abundance across different months. Species with extreme variation were identified using their coefficient of variation to detect seasonal spikes or inconsistencies.

To evaluate the differences in species abundance among multiple taxonomic groups, a one-way Analysis of Variance (ANOVA) was applied. This test was selected to determine whether the observed differences between species means were statistically significant. The ANOVA output included Sum of Squares (SS), degrees of freedom (df), Mean Square (MS), F-statistic, and p-values, as recommended by Zar (2010) and Magurran (2004) for ecological data sets. A critical F value was also calculated at a 95% confidence level to test the null hypothesis of no difference among group means. Graphical representations such as stacked bar charts were used to visualize temporal distribution patterns of species across April, May, and June. These figures aided in illustrating monthly trends and inter-species variability, helping to interpret the ecological relevance of observed patterns. The methodology and interpretation were informed by

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

previous studies on intertidal and algal-associated biodiversity in Indian coastal zones, particularly the works of Bhave & Apte (2007, 2011) and Hussain (2015, 2018), who highlighted the use of quadrat-based monitoring and statistical ecology to investigate marine invertebrate distributions. Additionally, the approach aligns with sampling protocols used in studies of Chaetomorpha and Sargassum-associated fauna (Azhagu et al., 2017; Marcel & Fosca, 2003).

Result & Discussion

A total of 18 faunal species were recorded across the six field visits conducted during April, May and June 2025 at the rocky intertidal zone of Bhuigaon Beach, Vasai. The study revealed distinct patterns of faunal abundance and diversity associated with common macroalgal species such as Sargassum, Ulva, and Enteromorpha.

Sr.No	Faunal Species	Likely Associated Algae
	Pennaria disticha (Cnidaria)	Sargassum, Ulva
	Branchiomma (Annelida – Polychaete)	Ulva, Enteromorpha
	Ischnochiton (Mollusca – Polyplacophora)	Sargassum, Ulva
	Nerita (Gastropod – Prosobranch)	Ulva, Enteromorpha
	Bakawan rotunda (Gastropod – assumed)	Ulva, Enteromorpha
	Bubble snail (Gastropod – Cephalaspidean)	Ulva, Enteromorpha
	Aplysia. sea hare (Opisthobranch)	Ulva, Enteromorpha
	Thecacera, (Nudibranchs)	Enteromorpha
	Atalodoris (Nudibranchs)	Enteromorpha
	Doriospella (Nudibranchs)	Enteromorpha
	Amphipod (Arthropoda – Amphipoda)	Sargassum, Ulva
	Macrophthalmus sulcatus (Crab)	Sargassum
	Decorator crab	Sargassum
	Porcelain crab (Anomura)	Sargassum
	Clibanarius infraspinatus (Hermit crab)	Sargassum, Ulva
	Penaeus monodon (Prawn)	Sargassum
	Lysmata rauli (Shrimp)	Ulva, Sargassum
	Sea urchin	Ulva, Sargassum

Table 2. Fauna species associated with algae

Sr. No	Group	Species
	Cnidaria	Pennaria disticha
	Annelida	Branchiomma
	Mollusca (Polyplacophora)	Ischnochiton
	Mollusca (Gastropoda - shelled)	Nerita, Bakawan rotunda, Bubble snail
	Mollusca (Gastropoda - opisthobranchs)	Aplysia, Thecacera, Atalodoris, Doriospella
	Arthropoda (Amphipoda)	Amphipod
	Arthropoda (Decapoda & Anomura)	Penaeus monodon, Macrophthalmus, Clibanarius, Porcelain crab, Decorator crab, Lysmata rauli
	Echinodermata	Sea urchin

Table 3. Species of fauna and their groups from Bhuigaon beach

Species were sampled using 1 m² quadrats during the lowest low tide to ensure maximum intertidal exposure. The highest abundance was observed for Nerita spp. (62 individuals), followed by Clibanarius infraspinatus (42 individuals), and

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Pennaria disticha (29 individuals) over the study period. Least abundant species included Amphipods, Doriospella, and Macrophthalmus sulcatus, each with ≤2 individuals observed over three months.

Sr. No	Species	April	May	June	Total
	Pennaria disticha (Cnidaria)	10	17	2	29
	Branchiomma (Annelida)	5	2	0	7
	Ischnochiton (Mollusca – Polyplacophora)	7	2	2	11
	Nerita (Mollusca – Gastropod: prosobranch)	20	32	10	62
	Bakawan rotunda (Mollusca – Gastropod: assumed)	0	0	10	10
	Bubble snail (Mollusca – Gastropod: cephalaspidean)	6	0	0	6
	Aplysia. sea hare (Mollusca – Gastropod: opisthobranch)	5	1	0	6
	Thecacera (Mollusca – Gastropod: nudibranch)	0	15	0	15
	Atalodoris (Mollusca – Gastropod: nudibranch)	2	1	0	3
	Doriospella (Mollusca – Gastropod: nudibranch)	0	2	0	2
	Amphipod (Arthropoda – Amphipoda)	1	0	0	1
	Macrophthalmus sulcatus (Arthropoda – Crab)	2	0	0	2
	Decorator crab (Arthropoda – Crab)	1	1	0	2
	Porcelain crab (Arthropoda – Anomura)	2	2	0	4
	Clibanarius infraspinatus (Arthropoda – Hermit crab)	10	17	15	42
	Penaeus monodon (Arthropoda – Prawn)	2	2	2	6
	Lysmata rauli (Arthropoda – Shrimp)	4	2	0	6
	Sea urchin (Echinodermata)	1	3	0	4

Table 4. Species observed in evolutionary order with total number of species.

Fig 3. Complete graphical representation of species counts in month- April, May & June.

Month-wise analysis revealed that May exhibited the greatest overall abundance, particularly due to spikes in Nerita (32) and Thecacera (15) Table 4. In contrast, June showed a notable decline in abundance across most species. This can be attributed to the onset of the southwest monsoon, which begins in early June on the western coast of India. The increased turbidity, rough sea conditions, and potential migratory or reproductive behavior of several intertidal organisms during this period may result in lower observable counts (Bhave & Apte, 2011; Hussain, 2015).

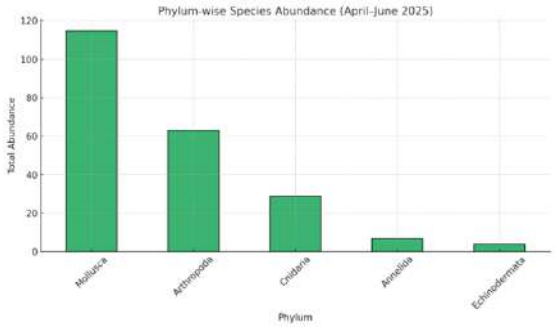

Fig 4. Phylum wise species abundance

Many intertidal invertebrates, including gastropods and decapods, enter reproductive or brooding phases during the early monsoon, often leading to changes in their microhabitat preference, reduced mobility, or temporary retreat into crevices and burrows. These behavioral patterns likely contributed to the decreased detectability and overall reduced abundance recorded in June. This seasonal variation is ecologically important and suggests that biodiversity assessments should be temporally distributed to account for phenological shifts. From a sustainability perspective, the observed temporal variation emphasizes the importance of repeated and seasonally distributed biodiversity monitoring. A single observation may not adequately represent the ecological condition of an intertidal habitat. Continued monitoring using standardized methods can provide a more reliable understanding of natural variation and help identify future changes in the ecosystem. To evaluate the variability and significance of species abundance across the sampling period, descriptive statistics and inferential analysis were performed. Table 5 presents the summary statistics, including the mean, variance, and standard deviation for each recorded species. Species such as Nerita, Clibanarius infraspinatus, and Pennaria disticha showed relatively higher means and greater variability, whereas species like Penaeus monodon and Amphipods had low and consistent counts, reflecting their limited presence or uniform occurrence across months.

Species	**Mean**	**Variance**	**Standard Deviation**
Pennaria disticha (Cnidaria)	9.67	56.33	7.50
Branchiomma (Annelida)	2.33	6.33	2.52
Ischnochiton (Mollusca – Polyplacophora)	3.67	8.33	2.89
Nerita (Gastropod – Prosobranch)	20.67	121.33	11.01
Bakawan rotunda (Gastropod – assumed)	3.33	33.33	5.77
Bubble snail (Gastropod – Cephalaspidean)	2.00	12.00	3.46
Aplysia. sea hare (Gastropod – Opisthobranch)	2.00	7.00	2.65
Thecacera (Gastropod –	5.00	75.00	8.66

Nudibranch)			
Atalodoris (Gastropod – Nudibranch)	1.00	1.00	1.00
Doriospella (Gastropod – Nudibranch)	0.67	1.33	1.15
Amphipod (Arthropoda – Amphipoda)	0.33	0.33	0.58
Macrophthalmus sulcatus (Crab)	0.67	1.33	1.15
Decorator crab (Crab)	0.67	0.33	0.58
Porcelain crab (Anomura)	1.33	1.33	1.15
Clibanarius infraspinatus (Hermit crab)	14.00	13.00	3.61
Penaeus monodon (Prawn)	2.00	0.00	0.00
Lysmata rauli (Shrimp)	2.00	4.00	2.00
Sea urchin (Echinodermata)	1.33	2.33	1.53

Table 5: Mean, Variance & Standard Deviation on species abundance.

To determine whether the differences in mean abundance among the species were statistically significant, a one-way ANOVA was conducted. The results are presented in Table 6. The analysis revealed a significant variation in abundance across species:

$F(17, 36) = 4.61$, $p < 0.001$, $F_{crit} = 1.915$

These results indicate that the differences in observed species abundance were not due to random chance. The p-value being well below 0.05 confirms that at least some species differed significantly in their abundance when compared to others (Table 6). This statistical outcome supports the ecological interpretation that certain species are more dominant and consistently abundant in this intertidal ecosystem, likely influenced by algal associations, habitat preferences, and seasonal behavior.

Innovative Ideas for Sustainable Coastal Management

Based on the observations made during the present study, the following approaches can be considered for future sustainable management and monitoring of intertidal biodiversity.

1. Long-Term Bhuigaon Biodiversity Monitoring Programme

The present study can serve as the baseline for repeated biodiversity assessments at Bhuigaon Beach. The same 1 m^2 quadrat methodology can be used during subsequent years to compare changes in species abundance and composition. This would allow the development of a long-term record of the intertidal ecosystem.

2. Student Participation in Coastal Monitoring

Educational institutions can involve students in periodic biodiversity surveys. Students can record species, photograph organisms, document macroalgal cover and maintain standardized field records.Such participation can combine scientific education with conservation awareness.

3. Digital Biodiversity Documentation

Photographs of recorded species can be systematically maintained along with information regarding date, tide, location and associated macroalgae. Over time, this can develop into a digital biodiversity database for Bhuigaon Beach.

4. QR-Based Biodiversity Awareness

A QR-based educational resource could be developed containing photographs and basic information about the organisms recorded from the site. This could help communicate local biodiversity

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

to students and visitors and encourage responsible use of coastal habitats.

Conclusion

The present study documented the diversity and abundance of macroalgae-associated fauna from the rocky intertidal zone of Bhuigaon Beach, Vasai, Maharashtra. A total of 18 faunal species representing Cnidaria, Annelida, Mollusca, Arthropoda and Echinodermata were recorded during the April–June 2025 sampling period. The associated macroalgae, primarily Sargassum, Ulva, and Enteromorpha, provided important habitat conditions for the recorded fauna. Nerita showed the highest abundance with 62 individuals, followed by Clibanarius infraspinatus with 42 individuals and Pennaria disticha with 29 individuals. Considerable variation was observed among species and across the sampling months. May showed the greatest overall abundance, whereas abundance declined during June, possibly due to early monsoon conditions and associated behavioural and environmental changes. The one-way ANOVA demonstrated significant differences in species abundance, with $F(17,36) = 4.61$ and $p < 0.001$. These findings indicate that the observed intertidal community is characterized by differences in species abundance and distribution. The study emphasizes that macroalgae are important ecological components of the intertidal ecosystem and contribute to the maintenance of associated faunal diversity. The documentation of this biodiversity at Bhuigaon Beach provides baseline information for future ecological monitoring and conservation. From the perspective of sustainable development, the importance of the present study lies in establishing scientific information that can support the long-term conservation and responsible management of coastal ecosystems. Sustainable development of coastal regions requires an understanding of existing biodiversity and ecological functions so that development and conservation can be appropriately balanced. The present baseline can therefore serve as a starting point for future monitoring programmes involving repeated biodiversity surveys, environmental measurements, digital documentation and student participation. Such approaches can help generate long-term ecological information and contribute to evidence-based sustainable coastal management.

Acknowledgement

I would like to express my sincere gratitude to all those who supported and encouraged me throughout the completion of this study entitled "Macroalgae and Associated Fauna Diversity at Bhuigaon Beach, Vasai, MH, India: A Baseline for Sustainable Coastal Management." I am deeply thankful to Annasaheb Vartak College, Vasai, for providing the necessary academic support and facilities required to carry out this study.

Abstract

The ease with which firms can establish themselves, operate, scale, and exit a market is closely linked to the quality of its legal and administrative institutions. Ease of Doing Business (EDB) has become a focal point of India's economic policy in recent years. The reform agenda has moved beyond the removal of licensing hurdles and now includes digitalization, regulatory simplification, compliance reduction, insolvency reforms, taxation, single-window governance, and the rationalization of petty offenses. This paper attempts to assess India's EDB reforms through the lens of legal and policy analysis. Reforming procedural bureaucracy is not the end goal – the emphasis is on whether legal and administrative changes have led to a significant improvement in terms of accessibility, predictability, efficiency, and cost reduction. The study tries to understand the constitutional underpinnings of economic freedoms, examines the laws and policies relating to corporate regulations, insolvency, taxation, digitalization, competitive federalism, and compliance reduction. It also analyses the reforms such as National Single Window System in terms of institutional mechanisms. The paper employs a doctrinal and qualitative research design. It focuses on the law, policy, and institutional mechanisms rather than quantifying the reform impact. Legal texts, policy documents, and scholarly literature are analysed to identify connections between procedural reforms and actual governance outcomes. The paper finds that India has made significant strides in reforming its regulatory framework but faces challenges in harmonizing diverse jurisdictions, reducing overlapping oversight, and removing protracted litigation. Digitalization reduces transaction costs, insolvency laws facilitate faster resolution of business closures, and compliance reduction initiatives target regulatory hurdles. However, inconsistent implementation, judicial delays, regulatory complexities, and disproportionate cost-benefit for small-scale enterprises remain pertinent issues.

The paper concludes that India needs to shift from the EDB paradigm and focus on Ease of Complying, Competing, and Resolving Disputes. While deregulation is important, India needs a balanced approach that targets transaction costs while maintaining the rule of law.

Keywords: *Ease of Doing Business; Legal Reform; Public Policy; Regulatory Governance; Business Regulation; Compliance Burden; National Single Window System; Corporate law; Insolvency; MSMEs; digitalization; Regulatory Reform.*

Introduction

Economic development depends not only on the availability of capital, labour, and technology but also on the legal institutions that govern economic relations. A firm needs stable and predictable legislation to make long-term investments, hire personnel, organize production, and scale its operations. Regulation that is inaccessible, irrational, excessive, or inconsistent with the needs of businesses increases the transaction costs of legitimate economic activity. By contrast, streamlined and transparent regulation reduces uncertainty and facilitates enterprise. The concept of Ease of Doing Business (EDB) emerged from the need to ensure that regulation is not an impediment to economic development. It captures the idea of how businesses interact with the state and what procedural and administrative challenges they encounter in their operations. India's reform process has been evolutionary but does not always build synergies between different aspects of regulation.

Quick Response Code:

Website: https://bnir.us

The economic liberalization of 1991 created a regulatory framework that allowed greater private-sector participation and removed many licensing and ownership restrictions. At the same The National Single Window System (NSWS) is one of the essential initiatives that aim to reduce the procedural and transaction costs of doing business in India. According to DPIIT, it allows firms to discover investment opportunities, apply for, and track the progress of approvals. It is designed to reduce the search burden of identifying the relevant authorities to approach for permits and licenses. India has witnessed significant legal reforms in the corporate law, insolvency, and tax domains. The Companies Act, 2013, Insolvency and Bankruptcy Code, 2016, and the Goods and Services Tax (GST) have transformed the legal and regulatory framework for corporations and indirect taxation, respectively. The current study, therefore, attempts to analyze the EDB reforms from the angle of legal and policy change. It explores the tripartite connection between legal rules, administrative procedures, and compliance costs. The paper argues that reforms to regulatory governance require not only legislative changes but also procedural and administrative tweaks that improve the implementation process.

Statement Of Problem

Although India has been implementing various Ease of Doing Business reforms, enterprises continue to encounter complexities in regulation, approvals, licensing, compliance, and administration. The problem is multifaceted, but the paper focuses on whether these challenges are a result of the lack of legal and administrative reform. In other words, it explores if procedural and regulatory changes have reduced the transaction costs of doing business in India.

Hypothesis

A) Null Hypothesis (H_0)

India's Ease of Doing Business reforms have not resulted in meaningful changes to the regulatory and procedural environment, reducing complexity, compliance costs, and transaction costs for businesses.

B) Alternative Hypothesis (H_1)

time, the reforms did not remove complexities in clearances and approvals needed for starting and operating businesses.

India's Ease of Doing Business reforms have resulted in meaningful changes to the regulatory and procedural environment, thus reducing complexity, compliance costs, and transaction costs for businesses.

Research Methodology

1. Research Design

The research design is doctrinal and qualitative. The paper focuses on statutory and policy provisions rather than relying on primary data collection. It uses legal texts, policy documents, and scholarly literature to identify connections between Ease of Doing Business reforms and the changes in legal and policy environments.

2. Doctrinal Legal Research

The doctrinal component of the paper focuses on the following laws:

- Constitution of India
- Companies Act, 2013
- Insolvency and Bankruptcy Code, 2016
- Taxation Laws (GST)
- Consumer Protection Act, 2019
- Labour laws
- Regulatory Notifications
- Public Policy Analysis

The policy analysis component examines the following:

- National Single Window System
- Reducing Compliance Burden
- Measurement of Regulatory Costs

India's Ease of Doing Business reforms cut across multiple sectors and require a comprehensive analysis of legal, policy, and technological dimensions. DPIIT's initiatives cut across multiple areas, including reforms to ease of doing business, reducing regulatory costs, and compliance reduction. The paper utilizes the following analytical framework:

Legal Rules → Administrative Procedures → Implementation → Compliance Cost → Business Outcome

Fig 1 – Compliance Outcome
Source **– "www.alamy.com"**

Sources

The paper uses primary and secondary sources of information. Statutes, regulations, and policy documents are considered primary sources, whereas scholarly literature is used as secondary sources. The World Bank's B-READY indicator is used as a reference for comparing Ease of Doing Business reforms in India and abroad.

Research Gap

There is an extensive body of literature that examines specific reforms, such as GST, IBC, corporate laws, and the National Single Window System. However, few studies attempt to demonstrate the connection between Ease of Doing Business reforms and broader themes of regulatory governance.

Limitations

The paper focuses on doctrinal and policy analysis rather than relying on primary surveys and statistical data. Therefore, it is not possible to generalize the findings for all enterprises in India.

Literature Review

1. Literature on Regulatory Quality

The extant literature on regulatory governance mainly focuses on the impact of regulation on economic performance. Scholars argue that excessive regulation increases the transaction costs of legitimate economic activity, while insufficient oversight leads to market failures.

This is an important consideration for reforms in India, since regulation is not an end but a means to achieve economic objectives.

2. World Bank Literature

World Bank's Ease of Doing Business indicator was one of the most discussed topics in the public policy literature of the last decade. The Bank's indicator analyzed regulatory practices in 190 economies and ranked them according to the ease with which a fictional enterprise can open and operate a business there. The Doing Business project was discontinued in September 2021 and replaced with the Business Regulation and Economic Development (B-READY) indicator. The new indicator attempts to balance the analysis of regulation and public administration. ([World Bank][3])

3. Indian Policy Literature

The DPIIT policy literature is an essential source for understanding the evolution of Ease of Doing Business reforms in India. The reforms have evolved from deregulation to managing compliance and reducing transaction costs.

4. Corporate Law Literature

One of the central themes of corporate law literature is the tension between easing corporate processes and ensuring accountability. Scholars note that reforming corporate law requires balancing the need for flexibility with the need for transparency.

5. Insolvency Literature

The Insolvency and Bankruptcy Code, 2016, is regarded as a transformative piece of legislation. However, the insolvency literature reveals that effective resolution of financial distress requires judicial and institutional capacity-building measures.

Research Gap

One of the key research gaps in the existing literature is the relationship between Ease of Doing Business reforms and the broader reform agenda. Most scholars focus on individual laws, such as the Companies Act or GST, without attempting to identify synergies between different reforms.

Main Analysis

Fig 2 – National Single Window
Source – "Infographics: National Single Window brings about real outcomes"

1. Constitutional Foundation of Business Regulation

The Indian Constitution lays down the broad principles of regulation. Article 19(1)(g) guarantees the right to carry on any trade or business. At the same time, the right is subject to reasonable restrictions under Article 19(6). Similarly, Article 14 ensures that regulation is not capricious or irrational.

Therefore, any regulation must be grounded in a reasonable objective, must be necessary to achieve this objective, and must not impose a burden disproportionate to the objective. This is a crucial constitutional consideration when designing Ease of Doing Business reforms.

2 From Liberalisation to Regulatory Governance

The reforms that began in 1991 reduced many of the entry barriers created by Licence Raj. However, liberalization addressed the question of "can the state allow enterprises to operate?" While deregulation was an important step, the new reforms have addressed the question of "can the state regulate efficiently?" Ease of Doing Business reforms, therefore, reflect a shift from liberalization to regulatory governance.

3. Insolvency and the Right to Exit

Business regulation is not limited to entering the market – it also includes exiting it. An analysis of just one aspect of regulation (entry) provides an incomplete picture. One of the objectives of liberalization was to allow more enterprises to emerge. However, if the state creates barriers to exiting, it discourages entrepreneurship.

The Insolvency and Bankruptcy Code recognizes the need for an orderly process for closing businesses. Resolution professionals and appropriate judicial oversight are essential to ensure that distress sales do not cause losses to stakeholders.

4 GST and the Question of Regulatory Simplification

GST was introduced to address the challenges created by multiple indirect taxes. It is a significant reform measure, but the focus on indirect taxes is misplaced because indirect taxes comprise only 11% of total revenue. The new tax regime aims to bring a more simplified structure and reduce the cascading effect.

However, the experience with GST highlights the difference between indirect tax harmonization and overall regulatory reform. Simplification of indirect taxation is desirable, but a comprehensive indirect tax reform should also consider frequency of payment, ease of computation, consensus on interpretation, dispute resolution, and timing of refunds.

5 National Single Window System

The National Single Window System (NSWS) is intended to address the difficulties caused by multiple government departments with disparate processes. The problem is not the number of authorities but the information asymmetry that causes search costs for enterprises trying to navigate the system.

The NSWS aims to remove this information asymmetry by providing a digital platform where an enterprise can identify the relevant authorities and apply for approvals. DPIIT describes it as "a discovery portal for investment promotion and facilitation of approvals." In effect, NSWS is the first step toward a unified system of approvals. The paper suggests that further reforms should focus on interoperability of different government systems, standardized data formats, and fixed timelines for processing applications.

6 Reducing Compliance Burden

One of the key areas of reform has been reducing the compliance burden. Regulation creates transaction costs, but some of these costs are

excessive and should be removed. Over time, new laws add to the existing rules, creating regulatory inflation. In effect, a law that was necessary at the time of its introduction becomes obsolete later. According to DPIIT, the main methods for reducing the compliance burden include simplification, rationalization, digitization, and decriminalization. The report notes that there has been significant progress in the digitization and rationalization of regulations. Reducing unnecessary paperwork and paperwork-related penalties is an important reform measure.

However, there is a need to adopt a life-cycle approach to compliance. Regulatory costs should be analysed not only from the perspective of enterprises but also of the government.

7 Cost of Regulation

One of the most promising developments in India's reform process is the attempt to understand the cost of regulation. Regulation creates transaction costs for businesses, but measuring these costs is challenging because many costs are neither direct (such as fees) nor visible.

According to DPIIT, the main components of the cost of regulation are time cost, substantive cost, intermediary cost, delay cost, and statutory cost. This is an important contribution to the reform process since it allows for identifying which regulations impose the heaviest burden on businesses.

8 MSMEs and Unequal Compliance Capacity

The reforms related to reducing the compliance burden have focused on removing unnecessary regulations. However, a critical analysis of the cost of regulation is needed, particularly from the perspective of MSMEs. Large enterprises have greater capacity to fulfil legal requirements, whereas small-scale enterprises may find even routine compliances prohibitively expensive.

Therefore, in addition to reducing the absolute cost of regulation, there is a need to address its differential impact on different enterprises.

9. Dispute Resolution

Unless commercial disputes are resolved efficiently, an enterprise will continue to incur costs associated with litigation. Dispute resolution, therefore, should be an integral part of regulatory reform. The World Bank's B-READY indicator explicitly aims at understanding "dispute resolution and institutional and digital infrastructure, time, cost, and enforceability." ([World Bank][1])

India's judicial reforms, including those related to commercial courts and alternative dispute resolution (ADR), are, therefore, crucial to improving the Ease of Doing Business. Enterprises need to be assured of the enforceability of commercial contracts, including the execution of judgments and alternative mechanisms for dispute resolution. Courts, arbitration, and mediation are essential dispute-resolution mechanisms.

10. From Ease of Doing Business to Ease of Living with Regulation

India's reform agenda should be aimed at creating a conducive environment where businesses can operate smoothly, expand, compete, and exit without disruptions. It is not enough to make it easy to start a business a regulatory framework needs to facilitate a continuum of activities that comprise a business's life cycle.

The B-READY indicator attempts to capture this vision by focusing on ease of establishing, locating, sourcing, hiring, financing, transacting, taxing, and adjudicating. It also explicitly mentions competition law, dispute resolution, and insolvency as essential aspects of a sustainable business environment.

Challenges

1 Fragmented Regulation: Businesses face multiple regulatory authorities.

2 Implementation Deficit: Legal reforms may not lead to commensurate administrative improvements.

3 Compliance Accumulation: New requirements may arise faster than old ones are removed.

4 MSME Burden: Small enterprises may bear disproportionate compliance costs.

5 Judicial Delay: Commercial disputes can persist for long periods.

6 Regulatory Uncertainty: Frequent amendments may complicate planning.

7 Uneven State Performance: Implementation quality varies between jurisdictions.

8 Local-Level Barriers: Municipal and district procedures are still significant.

9 Digital Exclusion: Technology may cause difficulties for businesses without digital capacity.

10 Public-Interest Conflicts: Regulatory simplification must remain compatible with environmental, labour, consumer and investor protection.

Findings

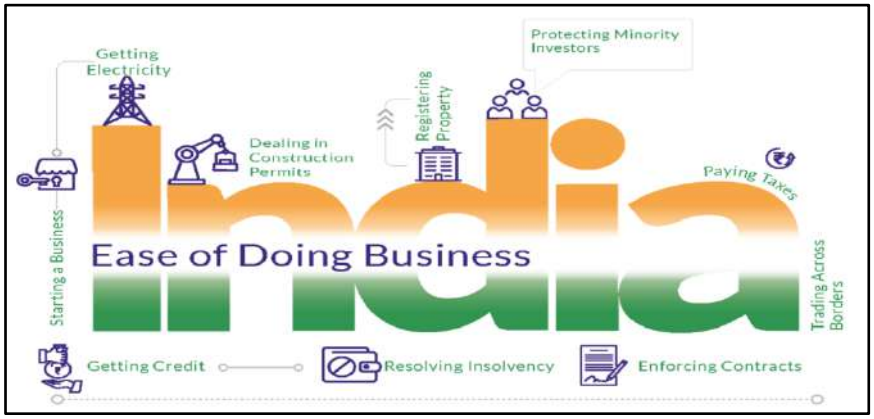

Fig 3 – Ease of Doing Business

Source – "Ease of Doing Business in India | Affluence Advisory Pvt Ltd"

The research produces the following findings:

1. India's Ease of Doing Business reforms represent a significant transformation in regulatory governance.
2. The reform agenda has broadened from deregulation to administrative simplification.
3. Digital governance has profoundly changed the interaction between businesses and government.
4. The National Single Window System addresses an important information and coordination problem.
5. Compliance reduction has become an institutional policy objective rather than an isolated reform.
6. The IBC has strengthened the legal architecture relating to business distress and exit.
7. GST has advanced tax integration but exposes the limitations of digital systems alone.
8. Competitive federalism has driven State-level regulatory reform.
9. MSMEs remain especially vulnerable to regulatory complexity.
10. Judicial capacity is an essential factor in Ease of Doing Business.

Hypothesis Testing

Research Indicator	Observation	Effect on Hypothesis
Digital government services	Increased online access and reduced physical procedures	Supports H_1
NSWS	Centralised mechanism for identifying and tracking approvals	Supports H_1
Compliance reduction	Simplification and elimination of burdensome requirements	Supports H_1
IBC	Structured insolvency framework	Supports H_1
GST	Greater tax integration	Supports H_1
Regulatory fragmentation	Multiple authorities remain	Weakens full effect
Judicial delays	Dispute resolution remains an institutional concern	Weakens full effect
MSME burden	Compliance costs remain significant	Weakens full effect
Local implementation	Reform quality varies by jurisdiction	Weakens full effect

Since the present study is doctrinal and qualitative, hypothesis testing involves legal and policy evidence rather than statistical testing.

Local implementation Reform quality varies by jurisdiction Weakens full effect

Analysis

The available legal and policy evidence demonstrates that India has not remained stagnant in its regulatory framework. The government has established multiple mechanisms specifically designed to reduce regulatory friction. DPIIT's current policy framework identifies compliance reduction, NSWS and regulatory-cost measurement as ongoing reform priorities. The NSWS demonstrates additional evidence of institutional change by attempting to consolidate approval-related information and services into a common digital platform.

However, the evidence is insufficient to support the conclusion that India's business environment is devoid of regulatory difficulty.

Hypothesis Result

The Null Hypothesis (H_0) is **rejected**.

The Alternative Hypothesis (H_1) is **accepted.**

India's Ease of Doing Business reforms have delivered a meaningful improvement in the legal and administrative environment for business activity.

However, this conclusion is qualified rather than absolute. The reforms have diminished several barriers but have not resolved the structural issues presented by fragmented regulation, implementation capacity, judicial delay and unequal compliance burdens.

Recommendations

1.Introduce Mandatory Regulatory Impact Assessment - Major new business regulations should be preceded by an assessment of their likely economic and administrative impacts.

The assessment should examine Compliance cost; impact on MSMEs; administrative capacity; alternatives; expected benefits; and Unintended consequences.

2. Establish Periodic Regulatory Review - Regulations should not remain in force indefinitely without review. Every major business regulation should be periodically assessed to determine whether it continues to serve its original purpose.

3.Strengthen NSWS Integration - NSWS should develop from a common interface into a genuinely integrated administrative system. The principle should be: One Application, One Data Submission, Multiple Departments.

4. Create a National Compliance Map - Businesses should be able to enter their sector, location and enterprise size and obtain a personalised list of applicable Central, State and local compliances.

5. Introduce MSME-Proportionate Compliance - Regulatory obligations should be calibrated according to business size and risk wherever appropriate.

6. Strengthen Local Governance - Reform should extend from ministries and State governments to municipalities, districts and local authorities.

7. Improve Commercial Dispute Resolution - Commercial courts, mediation, arbitration and digital judicial infrastructure should be strengthened.

8. Improve Regulatory Predictability - Major reforms should generally provide reasonable transition periods and clear implementation guidance.

9. Strengthen Digital Grievance Mechanisms - Businesses should be able to challenge technical errors, unexplained rejections and unreasonable administrative delays through accessible online mechanisms.

Conclusion

Ease of Doing Business has changed significantly in India. What seemed to be primarily an economic liberalisation objective has evolved into a wider programme of legal, administrative and technological reform.

The central finding of this research is that India's regulatory transformation is real but incomplete. The country has introduced important institutional changes. The Companies Act has modernised corporate regulation. The IBC has created a structured framework for business distress and insolvency. GST has transformed the architecture of indirect taxation. NSWS represents an attempt to diminish the fragmentation of business approvals. The compliance-reduction programme is particularly important because it acknowledges a problem that traditional deregulation sometimes neglects regulatory burden can build up even if no individual regulation seems unreasonable. A business experiences regulation through forms, portals, inspections, approvals, officials, deadlines, taxes and courts. Therefore, the true measure of regulatory success should be whether these interactions have become easier, faster, cheaper and more predictable. This is consistent with the logic underpinning B-READY. The World Bank's current methodology deliberately separates the regulatory framework from public services and operational efficiency and considers both formal and practical aspects of the business environment. ([World Bank][1]. The research supports the Alternative Hypothesis because India's reforms have changed materially the legal and administrative environment in which businesses operate. However, the conclusion must be qualified because significant barriers remain. The future reform agenda should concentrate particularly on four areas. First, integration: Central, State and local systems should become interoperable. Second, proportionality: compliance requirements should match the actual risk created by business activity. Third, accountability: businesses should have meaningful mechanisms to challenge administrative decisions. Fourth, measurement: reforms should be judged by actual time, cost and business experience. The ultimate objective should not be to create an environment where businesses are free from regulation. The future of Indian regulatory policy should therefore move beyond the traditional question of whether it is easy to start a business. The more important questions are whether it is easy to comply, operate, expand, compete, obtain justice and exit lawfully.

Acknowledgement
I would like to express my sincere gratitude to everyone who supported and guided me in the completion of this research paper titled "Ease of Doing Business Reforms in India: A Legal and Public Analysis." I am deeply thankful to my institution, Bhagubai Changu Thakur College of Law, Panvel, and the Department of Law, University of Mumbai, for providing the academic environment and resources necessary for undertaking this study.

Abstract

Academic libraries are expected to provide open, equitable and user-friendly access to information resources, yet inappropriate user behaviour can compromise the preservation, availability and effective use of library collections. This paper re-examines the problem of deviant behaviour in academic libraries from the broader perspective of user behaviour management, collection security and preventive control. The paper is developed as a conceptual review based on the themes, observations and literature represented in the source study. It does not claim a new statistical survey and therefore avoids presenting invented numerical findings. The discussion identifies major forms of problematic behaviour, including theft, mutilation, defacement, concealment or misplacement of materials, overdue retention, noise, misuse of facilities, disruptive mobile-phone use and other violations of library rules. It argues that effective control should not depend only on punishment. A balanced framework combining user education, orientation, socialization, staff supervision, surveillance, electronic security, stock verification, clear policies, fair sanctions and increased use of digital resources can provide stronger protection while maintaining a welcoming learning environment. The paper proposes an integrated library user behaviour management framework and highlights practical challenges such as limited budgets, staff shortages and weak awareness programmes. The framework can support academic libraries in reducing resource abuse and improving the sustainability of library services.

Keywords: *Academic libraries; user behavior; library security; collection protection; user education; surveillance; deviant behaviour; information resources; preventive control; library management.*

Introduction

The academic library is a major learning and information-support environment in which students, teachers, researchers and other users interact with collections, technology, services and library staff. The effectiveness of a library depends not only on the size of its collection but also on the responsible use, preservation and continued availability of its resources. When users violate established rules, the consequences may include damage to materials, loss of information resources, disruption of other users, additional expenditure and reduced service quality. The source study identifies deviant behaviour as behaviour that departs from accepted rules and norms of library use. Examples include theft, mutilation, defacement, hiding books, retaining overdue materials, excessive noise, eating or drinking in restricted areas, littering, vandalism, disruptive phone calls, harassment and misuse of computers or other facilities. Such behaviour affects both the physical collection and the learning environment. A contemporary approach to the problem should move beyond a narrow punishment-oriented model. Libraries need preventive systems that explain expected behaviour, make rules visible, strengthen supervision, secure collections and provide proportionate disciplinary responses. The central argument of this paper is that user behaviour management is most effective when educational, technological, administrative and disciplinary measures operate together.

Website: https://bnir.us

Background of the Study

Library resources are shared assets. A damaged or missing book is not merely a loss to one user; it can reduce access for many future users. The source literature describes theft and mutilation as significant forms of library malpractice and emphasizes the importance of collection security. Security weaknesses may create opportunities for inappropriate behaviour, while ineffective orientation may leave users unaware of acceptable

Problem Statement

Academic libraries attempt to balance two objectives: providing convenient access to information and protecting shared resources. Excessive control can make the library unfriendly, while inadequate control can expose collections and facilities to abuse. The practical problem is therefore to establish a system that discourages misconduct without unnecessarily restricting legitimate library use.

The source study associates recurring deviant behaviour with weaknesses in security, user education, supervision, staffing and resource-protection mechanisms. It also identifies financial constraints and the 'no man's property' attitude as challenges. These observations indicate the need for an integrated rather than isolated approach.

Objectives of the Study

1. To identify major forms of inappropriate and deviant behaviour encountered in academic library environments.
2. To examine the organizational and situational factors associated with misuse of library resources and facilities.
3. To examine the role of user education and socialization in promoting responsible library use.
4. To examine technological and administrative measures for protecting library collections.
5. To propose an integrated framework for managing user behaviour while preserving an open learning environment.
6. To suggest practical recommendations suitable for academic libraries with limited resources.

Research Methodology

This paper adopts a conceptual and literature-based review approach. The framework is developed from the source paper's discussion of deviant behaviour, user education, security measures, discipline, challenges and prospects, together with the references cited in that paper. The source study itself describes the use of librarian interviews and library observation in examining common deviant acts in selected academic libraries practices and the consequences of violations. The problem is particularly important in academic libraries because students may use high-demand materials during examinations and assignment periods. The source paper notes that limited copies of heavily used materials can create situations in which pages may be removed or materials may be concealed to gain exclusive access. This reinforces the need for adequate copies, digital alternatives, user education and systematic monitoring.

in Gondia; the present paper does not reproduce or claim those observations as a new empirical dataset. Instead, the available evidence is reorganized into a broader user-behaviour-management framework.

Thematic analysis is used to organize the material into five dimensions: behavioural problems, causes and risk factors, educational interventions, technological and physical security, and administrative/disciplinary responses. Because no new questionnaire, sample or statistical dataset has been supplied, no new percentages, inferential tests or numerical findings are fabricated.

Major Forms of Problematic User Behaviour

Theft and Unauthorized Removal

Theft directly reduces collection availability and may deprive other users of essential information. The source literature identifies different motivations for book theft, including personal possession, opportunistic behaviour and profit.

Mutilation of Library Materials

Mutilation includes tearing pages or otherwise damaging printed resources. It may occur when demand for a limited number of copies is high, especially around examinations or major assignments.

Defacement and Contamination

Writing on pages, painting over text or images, and spilling food or liquids can reduce the usefulness and physical life of printed resources. Food residue may also create additional preservation problems.

Concealment and Misplacement

Hiding materials between shelves or intentionally placing them where they cannot be found undermines equitable access and creates additional work for library staff.

Overdue Retention

Failure to return borrowed materials on time restricts access for other users and weakens the effectiveness of circulation management.

Disruptive Behaviour

Noise, inappropriate mobile-phone use, loitering and other disturbances can negatively affect the study environment.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Misuse of Technology and Facilities

Improper use of computers, networks or other facilities can affect service availability and may expose the library to security or operational risks.

Factors Contributing to Inappropriate Behaviour

1. Insufficient user orientation and weak awareness of library rules.
2. Weak supervision and gaps in collection-security procedures.
3. High demand for limited copies of frequently used materials.
4. Inadequate staffing and excessive workload on available staff.
5. Limited budgets for surveillance and electronic security devices.
6. Weak ownership or responsibility toward shared library property.
7. Peer influence and situational opportunities for misconduct.
8. Poorly communicated or inconsistently enforced circulation and disciplinary policies.

User Education as a Preventive Strategy

User education should be treated as a continuous preventive service rather than a one-time orientation. New users should receive clear information about borrowing, returning, handling, preservation, acceptable conduct, digital-resource use and consequences of violations. Existing users should receive periodic reminders through notices, signage, newsletters, demonstrations and short awareness programmes.

The source paper cites literature recommending orientation and awareness programmes, visible notices and demonstrations of damaged materials. Such approaches can make the consequences of misuse concrete and can help users understand that library rules protect collective access rather than merely restricting individual freedom.

Library Security and Technology

Physical and technological security should support, rather than replace, professional supervision. The source study identifies surveillance cameras, improved supervision, effective user-search procedures, electronic theft detectors and regular stock-taking as possible measures. In technology-enabled libraries, access-control systems, electronic surveillance and systematic circulation records can also strengthen accountability.

Security measures should be selected according to the library's size, budget, collection profile and risk level. A small college library may prioritize trained staff supervision, clear circulation procedures, stock verification and strategically placed cameras before investing in expensive integrated systems. The key principle is risk-based implementation rather than technology for its own sake.

Discipline and Fair Sanctions

Disciplinary action is an important component of behaviour management, but it should be transparent, proportionate and consistently applied. The source study discusses restitution for damaged materials, temporary suspension, disciplinary review, restrictions on library access and other measures. The objective of discipline should include deterrence, rehabilitation and protection of the library community. Libraries should publish a clear policy that distinguishes accidental damage from intentional misconduct and specifies an appeal or review mechanism where appropriate. Staff should also be covered by the same accountability framework when they participate in or facilitate misuse. Consistency is essential because selective enforcement can reduce trust in library management.

Proposed Integrated User Behaviors Management Framework

Stage	*Key Action*	*Purpose*	*Expected Outcome*
1. Educate	Orientation, signage, demonstrations, reminders	Create awareness	Better rule compliance
2. Prevent	Supervision, collection arrangement, adequate copies	Reduce opportunities	Lower risk of misuse
3. Detect	CCTV, electronic security, stock verification	Identify incidents	Faster response
4. Respond	Document incidents and apply fair sanctions	Ensure accountability	Deterrence and rehabilitation
5. Review	Analyze incidents and revise procedures	Continuous improvement	Stronger library security

Discussion

The integrated framework demonstrates that user behaviour is not controlled effectively by a single intervention. Education can establish expectations, but education alone may not prevent deliberate misconduct.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Security devices can detect unauthorized removal, but they cannot address poor circulation practices or disrespectful conduct. Punishment can deter some behaviour, but excessive or inconsistent punishment can damage the library's relationship with users. A balanced system therefore combines prevention, detection, response and review. The source study also highlights the importance of electronic resources because they may be less susceptible to some forms of physical abuse. Digital collections, however, introduce their own access, licensing, authentication and cybersecurity considerations. Therefore, migration toward electronic resources should complement—not replace—sound management of print collections.

Challenges in Implementation

1. Limited financial resources for surveillance and electronic security.
2. Insufficient staffing for continuous supervision.
3. Difficulty maintaining consistent user education programmes.
4. Concern that strict controls may discourage library use.
5. Weak reporting and documentation of incidents.
6. Large and diverse user populations with different expectations.
7. Need for regular maintenance, training and review of security systems.

Recommendations

1. Conduct structured library orientation for every new batch of students and provide periodic refresher programmes.
2. Display concise, multilingual and user-friendly rules at entry points, circulation areas and high-risk locations.
3. Introduce routine stock verification and maintain records of missing, damaged and recovered materials.
4. Use CCTV and electronic security systems according to institutional risk and budget.
5. Improve supervision at circulation points, reading rooms and collection areas.
6. Develop a written incident-reporting and disciplinary procedure with proportionate sanctions.
7. Promote responsibility for shared resources through campaigns, exhibitions and preservation awareness activities.
8. Increase access to high-demand electronic resources and provide legal digital alternatives where feasible.
9. Train library staff in conflict management, incident documentation, preservation and security procedures.
10. Review behavior-management data periodically and modify procedures based on recurring incident patterns.

Conclusion

Protecting library resources requires more than locking doors or imposing penalties. Academic libraries are social learning environments in which responsible behaviour must be encouraged through education, communication, supervision and fair accountability. The source study demonstrates the importance of user education, security measures, stock taking and appropriate disciplinary mechanisms. Building on those themes, this paper proposes an integrated framework in which libraries educate users, reduce opportunities for misconduct, detect incidents, respond fairly and continuously review their procedures. A well-designed behavior-management system can protect collections while maintaining the openness that is central to academic library service. The long-term objective should be to create a culture in which users understand that responsible use of library resources protects the rights of present and future learners.

Limitations and Scope for Further Research

This paper is conceptual and is based on the themes and references available in the supplied source paper. It does not introduce a new empirical sample or statistical dataset. Future research can test the proposed framework using questionnaires, interviews and observation across multiple academic libraries. Comparative studies can examine the effectiveness and cost of CCTV, electronic article surveillance, user education, digital-resource provision and different disciplinary approaches. Future empirical work may also develop a validated scale for measuring library user behaviour and perceived security.

Abstract

Public policy and economic reforms have played a significant role in shaping India's economic transformation, particularly since the introduction of the New Economic Policy in 1991. The reform process has progressively focused on liberalisation, privatisation, globalisation, fiscal restructuring, financial inclusion, digitalisation, investment promotion and strengthening the business environment. This study examines the role of public policy and economic reforms in promoting economic growth and development in India. The study is based on secondary data collected from official sources, including government publications, the Reserve Bank of India, Ministry of Statistics and Programme Implementation, Ministry of Finance, NITI Aayog and international databases. Selected indicators such as GDP growth, per-capita income, foreign direct investment, tax revenue, financial inclusion and employment are analysed to assess the outcomes of policy reforms. The study indicates that economic reforms have contributed to greater market efficiency, investment, financial inclusion and economic integration. However, challenges relating to employment generation, income inequality, regional disparities and inclusive development continue to require policy attention. The study concludes that future economic reforms should focus not only on accelerating economic growth but also on ensuring inclusive, sustainable and broad-based development.

Keywords: *Public Policy, Economic Reforms, Economic Growth, Economic Development, Inclusive Growth, Financial Inclusion, India*

Introduction

Public policy and economic reforms have been central to India's economic transformation over the past several decades. Public policy provides the institutional and regulatory framework through which governments influence economic activity, allocate resources, promote investment and address social and developmental priorities. Economic reforms, on the other hand, seek to improve the efficiency, competitiveness and productivity of the economy by introducing changes in taxation, trade, industry, finance, investment and governance. India's economic reform journey witnessed a major transformation with the introduction of the New Economic Policy in 1991. The reforms of liberalisation, privatisation and globalisation reduced excessive regulatory controls, encouraged private-sector participation and increased India's integration with the global economy. Over time, the reform process expanded beyond the traditional areas of industrial and trade policy to include financial-sector reforms, fiscal reforms, infrastructure development, digitalisation, financial inclusion and measures aimed at improving the ease of doing business. In recent years, several significant public policy initiatives have further influenced India's economic environment. Reforms such as the Goods and Services Tax (GST), Insolvency and Bankruptcy Code (IBC), financial inclusion programmes, Digital India, Make in India, MSME support measures and production-linked incentives have sought to strengthen formalisation, investment, entrepreneurship and economic efficiency. These initiatives reflect an increasing emphasis on combining economic growth with broader developmental objectives. Economic growth is generally measured through indicators such as Gross Domestic Product (GDP),

per-capita income, investment and industrial output, whereas economic development encompasses wider improvements in employment, financial inclusion, living standards, poverty reduction and access to economic opportunities. Therefore, assessing the success of public policy and economic reforms requires consideration of both quantitative economic growth and qualitative dimensions of development. Despite considerable progress, India continues to face challenges such as unemployment and underemployment, income inequality, regional disparities, informality and unequal access to economic opportunities. The effectiveness of reforms also depends on their implementation, institutional capacity and ability to ensure that the benefits of economic growth reach different sections of society. Against this background, the present study examines the role of public policy and economic reforms in India's economic growth and development. Using secondary data from official and recognised sources, the study analyses selected indicators such as GDP growth, per-capita income, foreign direct investment, tax revenue, financial inclusion and employment. The study aims to assess the contribution of reforms to India's economic transformation and identify the major policy challenges that need to be addressed for achieving inclusive and sustainable economic development.

Objectives of the Study

1. To examine the evolution of public policy and economic reforms in India.
2. To analyse the impact of economic reforms on India's economic growth.
3. To assess the contribution of public policies to economic development.
4. To analyse selected economic indicators using secondary data.
5. To examine the role of reforms in promoting investment, employment and financial inclusion.
6. To identify key challenges associated with economic reforms and suggest appropriate policy measures.

Review of Literature

Ahluwalia (2002): Ahluwalia examined India's economic reforms and highlighted the transformation from a highly regulated economy towards a more market-oriented system. The study discussed the role of liberalisation, trade reforms and industrial reforms in improving economic efficiency. It suggested that reforms contributed significantly to higher productivity and economic growth. However, the study also emphasised the need for further structural reforms.

Panagariya (2008): Panagariya analysed India's post-1991 economic reforms and their contribution to economic performance. The study observed that liberalisation and greater integration with the global economy improved investment, productivity and competitiveness. It highlighted the importance of reducing regulatory barriers and encouraging private-sector participation. The study concluded that reforms played an important role in accelerating India's economic growth.

Virmani (2009): Virmani examined India's economic development and the impact of policy reforms on long-term growth. The study argued that market-oriented reforms, macroeconomic stability and increased private investment contributed to improved economic performance. It also highlighted the importance of institutional and governance reforms. The study suggested that sustained reforms were necessary for maintaining higher growth and development.

Rodrik and Subramanian (2005): Rodrik and Subramanian examined the sources of India's growth acceleration and questioned the relative importance of different reform measures. Their study argued that improvements in the investment climate and changes in government attitudes towards private enterprise were important contributors to growth. The authors highlighted the significance of institutional factors in supporting economic reforms. The study provided an important framework for understanding the relationship between policy reforms and economic growth in India.

Research Methodology

The study adopts a **descriptive and analytical research design** based entirely on secondary data. Relevant information will be collected from reliable sources such as the **Reserve Bank of India (RBI), Ministry of Finance, Ministry of Statistics and Programme Implementation (MoSPI), NITI Aayog, Economic Survey, World Bank and IMF**. The study will examine selected indicators such as GDP growth, per-capita income, FDI, tax revenue, financial inclusion and employment to assess the impact of public policy and economic reforms on India's economic growth and development. Trend analysis, percentage analysis and CAGR will be used for interpretation of the collected data

Evolution of Public Policy and Economic Reforms in India

India's public policy and economic reforms have evolved from a state-controlled economic framework to a more market-oriented and globally integrated economy. The major turning point came

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

with the **1991 economic reforms**, followed by several fiscal, financial, industrial, digital and social policy reforms. The evolution reflects India's continuous efforts to promote economic growth, efficiency, investment and inclusive development.

Year/Period	Major Reform	Key Objective
1991	Liberalisation, Privatisation & Globalisation	Increase efficiency and competition
1998–2000	Financial & Banking Reforms	Strengthen financial institutions
2015	Digital India & Financial Inclusion	Promote digital and financial access
2017	GST	Simplify indirect taxation
2016	Insolvency and Bankruptcy Code	Improve insolvency resolution
2020 onwards	PLI Schemes	Promote manufacturing and investment

Major Economic Reforms and Public Policy Initiatives

India has introduced several major economic reforms and public policy initiatives aimed at improving economic efficiency, investment, employment, financial inclusion and sustainable development. The major reforms include **Liberalisation, Privatisation and Globalisation (1991), Goods and Services Tax (GST), Insolvency and Bankruptcy Code (IBC), Make in India, Digital India, Pradhan Mantri Jan Dhan Yojana, MSME reforms and Production Linked Incentive (PLI) schemes**. These initiatives have contributed to changes in taxation, investment, industrial development, financial inclusion and digitalisation. Together, these reforms reflect India's shift towards a more competitive, formalised, technology-driven and inclusive economy.

Reform	Area of Impact	Expected/Observed Outcome
GST	Taxation	Greater tax formalisation
IBC	Banking & Finance	Improved resolution of stressed assets
Jan Dhan	Financial Inclusion	Wider access to banking
Digital India	Digital Economy	Growth in digital transactions
PLI	Manufacturing	Increased investment and production
MSME Reforms	Employment	Support for entrepreneurship and jobs

Impact of Economic Reforms on Economic Growth

Economic reforms have significantly influenced India's economic growth by improving market efficiency, encouraging private investment, promoting competition and strengthening integration with the global economy. The liberalisation process initiated in 1991 reduced regulatory restrictions and created greater opportunities for private-sector participation and foreign investment. Subsequent reforms such as GST, financial-sector reforms, infrastructure initiatives and industrial policies have further supported economic activity. Improvements in GDP, per-capita income, foreign direct investment and industrial production indicate the changing performance of the Indian economy. However, fluctuations in growth and challenges related to employment, inequality and regional disparities suggest that economic reforms need to be complemented by effective public policies to ensure broad-based and sustainable economic growth.

Indicator	Growth/Development Dimension	Overall Trend
GDP	Economic Growth	Increasing
Per-Capita Income	Standard of Living	Increasing
FDI	Investment	Increasing
Financial Inclusion	Inclusive Development	Improving
Employment	Development	Mixed
Income Inequality	Inclusive Development	Continuing Challenge

Findings and Discussion

The study finds that public policy and economic reforms have contributed positively to India's economic growth by promoting investment, improving market efficiency, strengthening infrastructure and encouraging private-sector participation. The analysis indicates improvement in key indicators such as GDP, per-capita income, FDI and financial inclusion over the study period. Reforms such as GST, financial-sector reforms, digitalisation and industrial policy have also supported greater formalisation and economic integration. However, the benefits of growth have not been evenly distributed, with challenges related to employment, income inequality, regional disparities and informal economic activity

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

continuing to persist. The findings suggest that future reforms should focus on achieving a balance between higher economic growth, employment generation and inclusive and sustainable development.

Challenges and Policy Recommendations

Challenges

India's economic reform process continues to face challenges such as income inequality, unemployment and underemployment, regional disparities, a large informal sector and gaps in policy implementation. Limited access to finance and technology among smaller enterprises, along with the digital divide, also affects the equitable distribution of the benefits of reforms. Maintaining fiscal stability while increasing public investment and welfare expenditure remains another important challenge.

Policy Recommendations

The government should focus on employment-oriented economic growth, strengthening MSMEs, improving access to institutional finance and reducing regional disparities. Greater investment in education, skill development, infrastructure and digital connectivity can improve the productivity and inclusiveness of growth. Policy implementation and coordination between different levels of government should be strengthened, while future reforms should promote sustainable, inclusive and long-term economic development.

Conclusion

Public policy and economic reforms have played a significant role in transforming the Indian economy from a highly regulated system towards a more market-oriented, competitive and globally integrated economy. The study indicates that reforms have contributed to economic growth through increased investment, improved financial inclusion, greater private-sector participation and enhanced economic efficiency. However, challenges such as unemployment, income inequality, regional disparities and uneven distribution of economic benefits remain. Therefore, India's future policy framework should focus on achieving not only higher economic growth but also inclusive, sustainable and broad-based development. Effective implementation, institutional strengthening and continued policy innovation will be essential for ensuring that the benefits of economic reforms reach all sections of society.

Acknowledgement

I would like to express my sincere gratitude to all those who have supported and encouraged me in completing this research paper entitled "Public Policy and Economic Reforms in India: An Assessment of Their Impact on Economic Growth and Development." I am deeply thankful to my institution and colleagues for their valuable guidance, encouragement, and academic support throughout the study. I also acknowledge the contribution of various official and recognized sources, including the Reserve Bank of India, Ministry of Finance, Ministry of Statistics and Programme Implementation, NITI Aayog, World Bank, and International Monetary Fund, whose reports and databases provided valuable secondary data for this research.

Abstract

As India marches toward its Viksit Bharat @2047 mandate, digital labor platforms have transitioned from temporary novelty to a primary engine of urban employment. Projections by NITI Aayog and the V.V. Giri National Labour Institute indicate that the country's platform workforce will grow from under eight million in 2021 to over sixty million by mid-century. Yet, beneath this economic expansion lies an unprecedented structural change: the complete substitution of human supervisory management with algorithmic governance. Through dynamic pricing engines, automated order dispatch systems, real-time GPS tracking, and instant automated penalties, digital platforms have introduced a silent crisis of occupational mental health. This paper synthesizes empirical literature, policy documents, and global platform benchmarks (including the Fairwork India Ratings) through the combined lens of Technostress Theory and Self-Determination Theory. We map how algorithmic control systematically erodes worker autonomy, induces chronic hyper-vigilance, and fosters severe financial precarity across major Indian urban hubs. We argue that national targets for developed nation status (@2047) cannot be sustained if built upon an overworked and psychologically depleted workforce. Finally, we outline a human-centric policy pathway—the Algorithmic Decency and Human Capital Framework (ADHCF)—mandating algorithmic transparency, human rights of appeal against automated deactivations, and the integration of mental health care into state social security boards.

Keywords: *Gig Economy, Algorithmic Management, Techno-Stress, Mental Health, Self-Determination Theory, Viksit Bharat @2047, Platform Labor, Fairwork India.*

Introduction: The Dual Reality of India's Digital Labor Boom

The national agenda driving *Viksit Bharat @2047* envisions an economically developed, technologically advanced India anchored by a multi-trillion-dollar digital ecosystem and expansive Digital Public Infrastructure (DPI). Within this macroeconomic transformation, the rapid growth of the platform economy—spanning ride-hailing services like Ola and Uber, food and quick-commerce delivery like Swiggy, Zomato, and Zepto, and localized domestic labor like Urban Company—has reshaped labor dynamics across Tier-1 and Tier-2 cities. For millions of young workers, particularly internal migrants and educated youth facing formal sector entry barriers, platform apps provide immediate, low-threshold access to daily income.

Table 1: Longitudinal Growth & Projected Trajectory of India's Gig Workforce (2020–2047)			
Fiscal Year Horizon	***Active Gig Workforce (Millions)***	***% of Total Non-Agricultural Workforce***	***Primary Absorbing Sectors***
FY 2020–21	*7.7*	*2.60%*	*Ride-Hailing, Early Food Delivery*
FY 2024–25	*12*	*3.80%*	*Quick-Commerce, Hyper-Local Logistics*
FY 2029–30 (Projected)	*23.5*	*6.70%*	*E-Commerce, Home Services, Last-Mile Tech*
FY 2047 (Target Vision)	*61.6*	*14.89%*	*Tech Logistics, Autonomous Fleet Operations,* *Skilled Digital Gig Services*

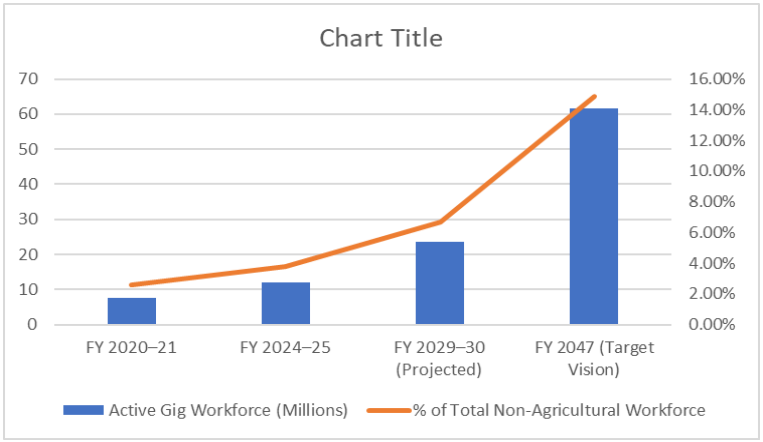

Chart 1: **Longitudinal Growth & Projected Trajectory of India's Gig Workforce (2020–2047)**

As illustrated in Table 1, the scale of this absorption is unprecedented. The active workforce is set to expand nearly eightfold by 2047, absorbing nearly 15% of the non-agricultural labor market. However, behind this narrative of flexibility and micro-entrepreneurship lies a fundamental labor contradiction. What is celebrated as work autonomy is routinely governed by complex software code. In place of human managers who evaluate context and negotiate workloads, platform workers are directed by automated algorithms that independently assign tasks, track movement speed, calculate surge pay, process customer ratings, and enforce account suspensions without human intervention. While algorithmic management streamlines logistics for platform companies, it transfers operational uncertainty and psychological burden directly onto individual workers. This paper investigates how algorithmic governance impacts gig worker mental health in India, and asks what policy reforms are urgently needed to build an ethically grounded labor force for 2047.

Theoretical Foundations: Technostress and Frustrated Autonomy

Analyzing the psychological experience of platform labor requires looking beyond conventional industrial psychology. We pull together two distinct frameworks: Ragu-Nathan's **Technostress Theory** and Deci and Ryan's **Self-Determination Theory (SDT)**.

In platform work, technostress is not a temporary frustration with bad software; it is built into the business model itself. Workers face severe *techno-overload*, constantly pressured by real-time countdown clocks and automated dispatch alerts. They experience constant *techno-uncertainty* because the rules governing their earnings change arbitrarily when algorithms alter base pay rates or shift incentive thresholds overnight. Crucially, workers suffer from profound *techno-insecurity*. Because algorithms track order acceptance rates and speed metrics, workers live in continuous fear

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

that declining a bad route or taking a necessary break will lower their account score, leading to lower priority orders or account suspension.

Table 2: Psychometric & Operational Matrix of Technostress Drivers

Algorithmic Stressor	Operational Trigger Mechanism	Measured Psychological Impact	Prevalent Psychometric Score (Scale 0–5)	Primary Physiological Outcome
Techno-Overload	Sub-15 min timer countdowns, continuous dispatch alerts	Cognitive overload, continuous hyper-vigilance	4.6 / 5.0 (High)	Elevated cortisol, chronic sleep deprivation, risk-taking
Techno-Uncertainty	Dynamic surge rate fluctuations, shifting bonus milestones	Financial anxiety, chronic decision fatigue	4.4 / 5.0 (High)	Gastric distress, tension headaches, depressive episodes
Techno-Insecurity	Sudden account lockouts, automated penalty slots	Deactivation anxiety, helpless compliance	4.8 / 5.0 (Critical)	Panic attacks, extreme emotional labor, burnout
Techno-Invasion	Off-shift push notifications, off-peak bonus lures	Dissolution of family time, rest disruption	3.9 / 5.0 (Moderate-High)	Restlessness, relationship strain, chronic exhaustion

When evaluated through Self-Determination Theory alongside the psychometric mappings in Table 2, platform management frustrates the three core psychological needs necessary for human well-being: **autonomy**, **competence**, and **relatedness**.

First, perceived autonomy is undermined because workers are constantly monitored by GPS and penalized for taking deviations or unapproved breaks. Second, worker self-competence is eroded by opaque, non-negotiable rating systems where a single low customer rating—often left for reasons outside the worker's control, like kitchen delays or traffic—drops their overall score and reduces their earning potential. Third, relatedness is virtually eliminated. Platform workers operate in physical isolation, lacking a shared workplace, supportive colleagues, or human managers to talk to, turning daily work into a lonely, atomized routine.

Psychological Stressors in Indian Platform Work

Field surveys and qualitative studies across Indian metropolitan areas reveal four primary stressors that severely impact gig worker well-being.

1. Quick-Commerce Time Pressure and Hyper-Vigilance

The rise of quick-commerce platforms promising 10-to-15-minute order deliveries has radically heightened work intensity. Algorithms calculate delivery times based on idealized traffic assumptions, leaving virtually zero margin for real-world delays. Delivery partners are forced into a state of continuous cognitive hyper-vigilance—constantly glancing at smartphone screens for notifications while navigating dense traffic. Physiologically, sustained hyper-vigilance triggers prolonged activation of the sympathetic nervous system, causing elevated cortisol, chronic physical

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

exhaustion, sleep loss, and an increased risk of traffic accidents.

2. Wage Volatility, Shift Inflation, and Real Earnings

In real terms, platform earnings are highly unpredictable. Base pay, surge bonuses, and distance payouts are continuously recalibrated by dynamic algorithms. As platforms reduce per-order baseline payouts over time, workers compensate by extending daily shift hours—creating an operational treadmill where longer working hours correlate directly with physical burnout.

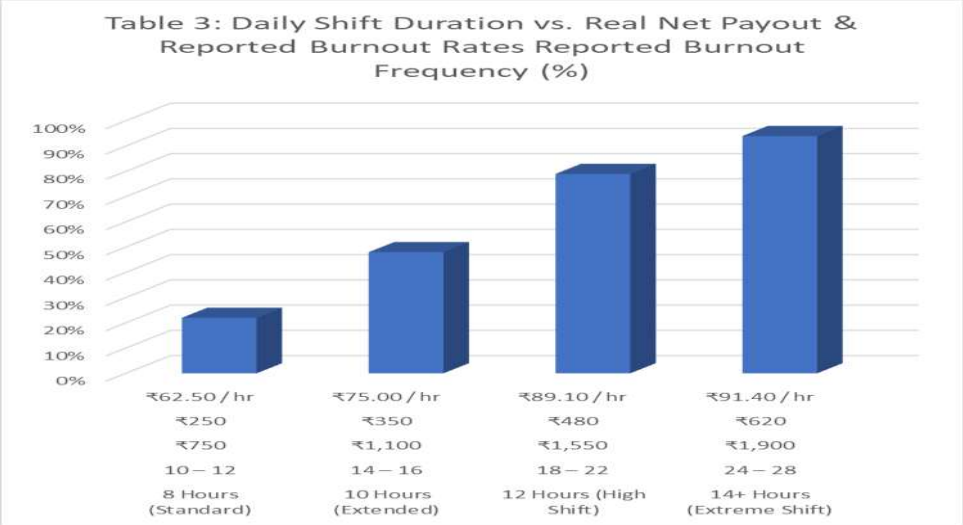

Table 3: Daily Shift Duration vs. Real Net Payout & Reported Burnout Rates

Daily Logged Shift Duration	Average Orders Completed	Gross Earnings (INR)	Operational Asset Expenses (Fuel/Data/Maint.)	Net Hourly Real Earnings (INR/hr)	Reported Burnout Frequency (%)
8 Hours (Standard)	10 – 12	₹750	₹250	₹62.50 / hr	22%
10 Hours (Extended)	14 – 16	₹1,100	₹350	₹75.00 / hr	48%
12 Hours (High Shift)	18 – 22	₹1,550	₹480	₹89.10 / hr	79%
14+ Hours (Extreme Shift)	24 – 28	₹1,900	₹620	₹91.40 / hr	94%

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

As demonstrated in Table 3, while net hourly real earnings plateau around ₹91/hour due to soaring asset and fuel maintenance costs, burnout rates jump from 22% during a standard 8-hour shift to a staggering **94% for extreme shifts of 14+ hours**.

3. Algorithmic Opacity and Deactivation Anxiety

The most psychologically distressing element of platform labor is algorithmic opacity—the complete inability to see or question how platform decisions are made. Sudden "digital dismissals," where an account is locked due to an automated fraud flag or a dip in acceptance rates, happen without prior warning. When workers attempt to contest a suspension, they are usually routed through automated in-app chatbots that issue repetitive, canned responses. The absence of a human support channel leaves workers feeling helpless and deeply insecure about their livelihoods.

Table 4: Granular Fairwork India Scorecard Breakdown (2024)

Platform	Core Sector	Fair Pay (Out of 2)	Fair Conditions (Out of 2)	Fair Contracts (Out of 2)	Fair Management (Out of 2)	Fair Representation (Out of 2)	Cumulative Score (Out of 10)
BigBasket	Quick-Commerce	1	2	1	2	0	10-Jun
Swiggy	Food Delivery	0	2	2	2	0	10-Jun
Urban Company	Home Services	1	1	2	2	0	10-Jun
Zomato	Food Delivery	0	2	2	2	0	10-Jun
BluSmart	Ride-Hailing	0	2	1	2	0	10-May
Zepto	Quick-Commerce	0	2	1	1	0	10-Apr
Amazon Flex	Logistics	0	1	1	0	0	10-Feb
Flipkart	E-Commerce	0	1	0	0	0	10-Jan
Ola	Ride-Hailing	0	0	0	0	0	0 / 10
Porter	Logistics	0	0	0	0	0	0 / 10
Uber	Ride-Hailing	0	0	0	0	0	0 / 10

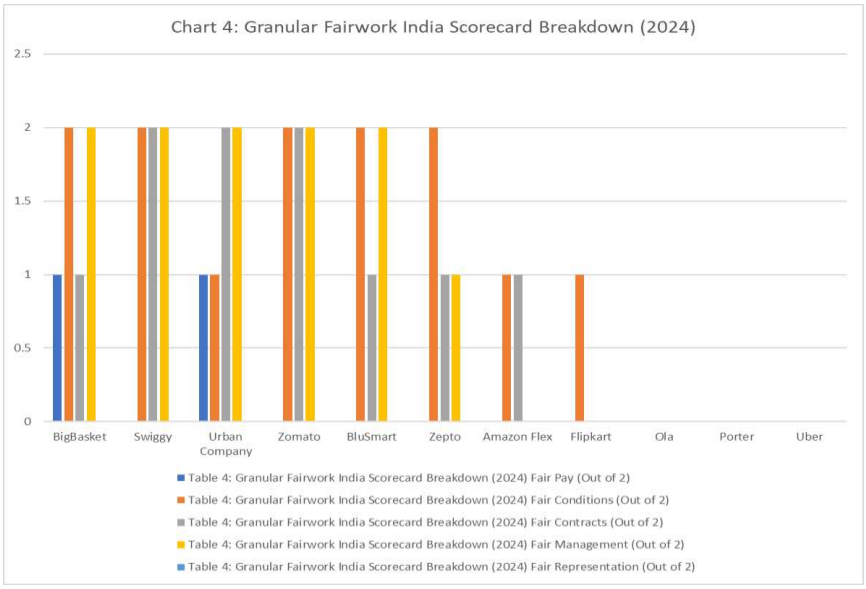
4. Social Isolation and Structural Atomization

Unlike traditional workplaces, platform work offers no break rooms, shared spaces, or peer support networks. Workers view one another as competitors for order dispatches and peak shift slots. This structural isolation prevents informal peer support and stops workers from organizing collectively, leaving them completely vulnerable to platform decisions.

Industry Benchmarks: Insights from Fairwork India 2024

The annual evaluation by the **Fairwork India Team** (hosted by IIIT Bangalore and the Oxford Internet Institute) provides a stark quantitative benchmark of platform working conditions. Fairwork evaluates major Indian digital platforms against five basic principles: Fair Pay, Fair Conditions, Fair Contracts, Fair Management, and Fair Representation.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)



The 2024 scores in Table 4 highlight systemic structural vulnerabilities across the board. Out of a maximum score of 10 points, top-performing platforms (BigBasket, Swiggy, Urban Company, Zomato) scored just 6 points, while major ride-hailing and logistics providers (Ola, Uber, Porter) scored zero. A central finding in the 2024 report was that **not a single evaluated platform earned a point for Fair Representation**. None officially recognized independent worker unions or provided formal, democratic grievance mechanisms.

Furthermore, the report observed a growing shift toward pre-booked shift schedules and fixed slots. Workers who fail to fulfill these scheduled slots face financial penalties or lose access to high-demand shifts later. This practice erodes the primary benefit that drew workers to gig work in the first place: true schedule flexibility.

Policy Analysis: Progress and Regulatory Gaps

As India moves toward its 2047 economic targets, public policy must balance technology adoption with labor protections. Current policy efforts show meaningful progress, but critical gaps remain unaddressed when compared to required human capital standards.

Table 5: Policy Framework Comparative Matrix

Policy & Welfare Dimension	Existing Framework (Code on Social Security 2020)	State Legislation (e.g., Rajasthan Act)	ADHCF Policy Target (@2047)
Social Security Financing	1–2% aggregator turnover levy (capped at 5% worker pay)	**Automatic fee deducted per transaction**	Integrated pool financing health, pensions, and mental health
Algorithmic Transparency	**No explicit statutory provisions**	**Focuses primarily on monetary fee collection**	Mandatory Algorithmic Impact Assessments & plain-language metric disclosures
Dispute Resolution	**Standard labor court administrative routes**	**Localized welfare board review channels**	Statutory human-in-the-loop review for suspensions within 48

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

			hours
Psychosocial Protection	**Omitted**	**Omitted**	Banning sub-10-minute promises; app-enforced rest periods
Occupational Mobility	**Unlinked to skill frameworks**	**Registration tracking only**	Portable digital skill credentials on India's DPI hub

The Code on Social Security (2020) vs. State Innovations

As mapped in Table 5, the Code on Social Security marked a major legislative milestone by formally recognizing "gig workers" and "platform workers" within Indian labor law. The Code mandates state-level Social Security Boards and proposes funding worker benefits through a platform turnover levy. However, nationwide rollout has been hampered by delays in state-level rule notifications and slow integration with the central e-Shram portal. More importantly, the Code focuses entirely on physical social safety nets, completely overlooking algorithmic stress, digital surveillance, and psychological well-being. State governments have begun stepping in to fill these regulatory gaps. The *Rajasthan Platform Based Gig Workers (Registration and Welfare) Act* established a dedicated welfare board and introduced an automated, transaction-level welfare fee collected directly from platform apps, creating a practical blueprint for other states like Karnataka and Maharashtra.

Strategic Policy Recommendations: The ADHCF

To bridge the gap between economic expansion and human well-being, we propose the **Algorithmic Decency and Human Capital Framework (ADHCF)**. This policy pathway is designed around five core interventions:

1. **Mandatory Algorithmic Impact Assessments (AIAs):** Platforms operating in India should undergo mandatory annual stress and fairness audits overseen by the Ministry of Labour and Employment and MeitY. These audits must ensure that route algorithms do not force workers into unsafe driving conditions or set impossible delivery targets.
2. **Statutory Algorithmic Transparency:** Platforms must provide workers with plain-language explanations of how their pay, task dispatches, and scores are calculated. Crucially, automated algorithms should be legally barred from executing permanent account suspensions without human review and a formal right of appeal within 48 hours.
3. **Psychosocial Safety Standards:** Regulators should restrict marketing models that rely on hyper-fast delivery times (such as sub-10-minute delivery guarantees) that endanger worker safety. Platforms must also build enforced rest breaks into their app interfaces, preventing workers from staying continuously logged in during extreme shifts.
4. **Integrating Mental Health into Social Security:** State welfare boards must look beyond physical accident coverage. Gig workers should receive direct, subsidized access to national tele-mental health services like **Tele-MANAS**, alongside regional health check-up kiosks located near high-density platform worker hubs.
5. **Portable Skill Credentials via Digital Public Infrastructure:** To help workers transition out of repetitive gig roles, the government should launch portable, verified skill badges on the Skill India Digital Hub. These credentials can record accumulated work hours, customer ratings, and safety records across platforms, helping workers access formal employment, micro-loans, and specialized technical training.

Conclusion

India's journey toward *Viksit Bharat @2047* requires a resilient, healthy, and sustainably employed workforce. The platform economy has proven its ability to absorb labor at scale, but relying on unmitigated, opaque algorithmic control comes at a steep human cost. Treating workers as simple inputs in an optimized software system leads to chronic stress, loss of autonomy, and early occupational burnout. By transitioning toward human-centered platform governance—enforcing algorithmic transparency, guaranteeing human rights of appeal, integrating mental health into social security, and providing clear career transition pathways—India can set a global example for

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

equitable digital growth. Protecting the psychological well-being of platform workers is not just an ethical duty; it is an absolute necessity for building a truly developed nation by 2047.

Acknowledgement

The author sincerely expresses gratitude to all those who contributed directly or indirectly to the completion of this research paper titled "Techno-Stress, Algorithmic Governance, and Mental Health in the Gig Economy: A Meta-Synthesis of Policy Frameworks and Empirical Findings for Viksit Bharat @2047." The author is deeply grateful to the academic community and researchers whose valuable theoretical and empirical contributions on technostress, Self-Determination Theory, algorithmic management, platform labour, occupational well-being, and the gig economy provided an essential foundation for this study.

Abstract:

The accelerating climate crisis and the rapid expansion of artificial intelligence (AI) have created a new intellectual landscape in which environmental sustainability no longer be discussed independently of technological development. Literature, as a cultural form capable of representing ecological relationships, technological anxieties, and alternative futures, has an important role in this debate. This paper examines how contemporary ecocriticism respond to the environmental challenges associated with artificial intelligence while also exploring the potential of AI to support environmental knowledge, literary interpretation, and sustainable futures. Drawing upon ecocritical theory, environmental humanities, posthumanism, Indigenous ecological thought, and recent scholarship on AI and environmental sustainability, the study analyses selected works including Margaret Atwood's Oryx and Crake, Amitav Ghosh's The Great Derangement, Richard Powers's The Overstory, Robin Wall Kimmerer's Braiding Sweetgrass, and Donna J. Haraway's Staying with the Trouble. The paper argues that these texts challenge anthropocentric assumptions by foregrounding interdependence among humans, nonhuman organisms, technologies, and ecological systems. Atwood exposes the destructive consequences of technological mastery; Ghosh identifies the limitations of literary forms that marginalize ecological catastrophe; Powers expands narrative attention from individual human lives to forests and multispecies networks; Kimmerer proposes reciprocity rather than domination as the basis of ecological ethics; and Haraway advocates "making-with" other species rather than seeking technological mastery over nature.

Keywords: *Ecocriticism, Artificial Intelligence, Environmental Humanities, Sustainability, Climate Change, Literature, Posthumanism, Ecological Intelligence, Indigenous Knowledge, Sustainable Futures etc.*

Introduction:

The twenty-first century is characterized by two apparently different but increasingly interconnected transformations: the intensification of ecological crisis and the rapid development of artificial intelligence. Climate change, biodiversity loss, deforestation, water scarcity, pollution, and resource depletion have fundamentally altered humanity's relationship with the natural world. AI has emerged as one of the most influential technological developments of the contemporary period. Its applications extend from education, medicine, agriculture, finance, and communication to climate modelling, energy management, environmental monitoring, and biodiversity conservation. The relationship between AI and the environment, however, is not simply one of technological solution and ecological benefit. Artificial intelligence depends upon extensive material infrastructures: data centres, electricity networks, semiconductor manufacturing, cooling systems, rare minerals, water resources, and global supply chains.

Website: https://bnir.us

The International Energy Agency's *Energy and AI* report emphasizes that AI development is inseparable from electricity demand because AI training and deployment depend heavily on data centres. At the same time, AI may contribute to energy-system optimization and other environmental applications. The environmental implications of AI therefore require a critical framework capable of questioning both technological optimism and technological pessimism. Ecocriticism provides such a framework because it investigates the relationship between literature, culture, and the physical environment. The field has developed from an initial concern with representations of nature toward broader questions involving environmental justice, posthumanism, animal studies, Indigenous knowledge, climate change, the Anthropocene, and technological mediation. Cheryll Glotfelty and Harold Fromm's *The Ecocriticism Reader* played an important role in establishing ecocriticism as a major field of literary inquiry, while subsequent scholarship has expanded the field into the environmental humanities. The environmental humanities are particularly important because environmental problems are not addressed through scientific and technological knowledge alone. Robert S. Emmett and David E. Nye argue that environmental problems also require cultural, ethical, historical, and humanistic interpretation. Their work demonstrates how questions of climate change, species extinction, consumption, energy, environmental justice, and the Anthropocene require interdisciplinary approaches. Literature contributes to this process by creating narratives through which environmental crisis becomes emotionally and culturally intelligible. A scientific report may provide evidence of rising temperatures, but a novel represent what ecological transformation means to human and nonhuman communities. A literary text make visible relationships that quantitative data may not adequately communicate: attachment to place, loss of species, ecological memory, environmental injustice, technological alienation, and the psychological consequences of planetary instability.

Objectives of the Study

1. To examine the development of ecocritical thought in relation to contemporary environmental crises.
2. To analyse literary representations of ecological destruction, technological development, and human–nonhuman relationships.
3. To examine the relationship between artificial intelligence and environmental sustainability.
4. To explore how literature provide ethical perspectives on technological development.
5. To investigate Indigenous and posthuman approaches to ecological relationships.

Research Methodology

This study adopts a qualitative, interdisciplinary, interpretive methodology. It combines close textual reading with eco-critical, environmental-humanities, posthumanist, and technological perspectives.

The primary literary texts selected for analysis are:

- Margaret Atwood's *Oryx and Crake*
- Amitav Ghosh's *The Great Derangement: Climate Change and the Unthinkable*
- Richard Powers's *The Overstory*
- Robin Wall Kimmerer's *Braiding Sweetgrass*
- Donna J. Haraway's *Staying with the Trouble: Making Kin in the Chthulucene*

These texts have been selected because they provide different perspectives on ecological crisis, technological development, human exceptionalism, biodiversity, Indigenous knowledge, and multispecies relationships. The study also draws upon authoritative environmental and technological reports, particularly publications of the Intergovernmental Panel on Climate Change (IPCC), International Energy Agency (IEA), and United Nations Environment Programme (UNEP). The methodology is therefore comparative and interdisciplinary, connecting literary criticism with environmental science, technology studies, environmental ethics, and sustainability discourse.

Ecocriticism

Ecocriticism examines the relationship between literature and the physical environment. Early ecocritical scholarship challenged the tendency of literary studies to treat nature merely as background or setting. Instead, the environment becomes an active component of literary meaning.

Lawrence Buell's work expanded the field by emphasizing environmental imagination and the representation of ecological relationships. His *The Future of Environmental Criticism* examines the development and future direction of ecocritical scholarship and places environmental crisis at the centre of literary criticism.

Environmental Humanities:

The environmental humanities broaden ecological inquiry beyond the natural sciences. Environmental problems are simultaneously scientific, political, cultural, ethical, historical, and literary.

Emmett and Nye emphasize that environmental problems are not solved through science and technology alone. Humanistic disciplines contribute to understanding climate change, species extinction,

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

over-consumption, energy use, environmental justice, and the cultural values underlying ecological decisions. This perspective is important in AI because AI is a technological object. It is also a cultural system that embodies assumptions about intelligence, efficiency, productivity, knowledge, and human control.

Posthumanism:

Posthumanist thought challenges the assumption that human beings are the centre of all value and meaning. In ecological contexts, posthumanism encourages attention to animals, plants, microorganisms, landscapes, machines, and technological systems. The posthuman perspective is particularly relevant to AI because artificial intelligence destabilizes conventional distinctions between human intelligence and machine intelligence. An ecological approach must also question whether technological intelligence should be regarded as superior to biological and ecological forms of intelligence.

Ecocriticism and the Environmental Crisis:

The urgency of ecological criticism is supported by contemporary climate science. The IPCC's *Climate Change 2023: Synthesis Report* concludes that human activities, principally greenhouse-gas emissions, have unequivocally caused global warming. It also emphasizes that climate change is already affecting weather and climate extremes across regions. This scientific reality changes the role of literature.

Literature no longer treat nature simply as picturesque scenery. Forests, oceans, rivers, animals, atmospheric systems, and landscapes are active participants in human existence.

The traditional literary model frequently positions as:

Human = subject nature = object

Ecocriticism challenges this division by suggesting the below sequence:

human + nonhuman + technological + ecological = interconnected system

Such an approach is especially valuable in an age in which technological systems increasingly mediate human relationships with the environment.

Margaret Atwood's *Oryx and Crake*: Technology, Genetic Manipulation, and Ecological Collapse

Margaret Atwood's *Oryx and Crake* provides a powerful literary exploration of technological domination and ecological destruction. The novel imagines a future in which corporate power, genetic engineering, consumer culture, biotechnology, and scientific ambition have transformed the planet. The novel's ecological crisis is not presented as an isolated environmental accident. Instead, it emerges from a culture that treats scientific and technological capability as inherently desirable. Atwood's world exposes the dangers of technological development without ethical restraint. Human beings attempt to redesign nature according to market demands and personal desires. Species boundaries become manipulable, biological life becomes a commodity, and technological innovation becomes disconnected from ecological responsibility. The novel is particularly relevant to the age of AI because it questions the ideology of technological solutionism.

Technological solutionism assumes:

problem → technology → solution

Atwood's narrative suggests a more complicated model:

technological intervention → new ecological consequences → new ethical problems

The importance of *Oryx and Crake* lies therefore not in its prediction of a particular technology but in its critique of an ideology that assumes technological capacity automatically represents progress. Penguin Random House describes the novel as the first volume of the *MaddAddam* trilogy and presents its world as one transformed by corporate power and uncontrolled genetic engineering.

Amitav Ghosh and the Failure of the Literary Imagination:

Amitav Ghosh's *The Great Derangement: Climate Change and the Unthinkable* offers one of the most influential literary critiques of climate representation. Ghosh argues that mainstream literary fiction has frequently failed to adequately represent climate catastrophe. The problem is not necessarily that writers lack environmental awareness; rather, literary conventions often privilege individual experience, psychological realism, domestic narratives, and gradual causality. Ghosh's argument is important for AI because AI also challenges traditional narrative structures. Artificial intelligence operates across networks rather than individual spaces. Its effects are distributed across data centres, supply chains,

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

workers, users, governments, corporations, and ecosystems. Thus both climate change and AI require literature to move beyond narrow individualism.

Richard Powers's *The Overstory*: Literature and Multispecies Consciousness

It becomes the below structural sequence:

a living organism,
a community,
a historical archive,
a carbon-storage system,
a habitat,
a source of human culture,
and an ecological actor.

This narrative structure challenges the assumption that human life constitutes the primary scale of importance. From an ecocritical perspective, *The Overstory* demonstrates the capacity of literature to make slow ecological processes narratively visible. Trees operate on temporal scales radically different from those of human beings. Their growth, communication, death, and ecological relationships encourage readers to think beyond the human lifespan. This has direct implications for AI. AI operates at machine speed, whereas ecological systems frequently operate at biological and geological speeds. A sustainable future requires the reconciliation of these temporalities.

Richard Powers's *The Overstory* expands ecological consciousness by placing trees and forests at the centre of narrative attention. The novel challenges conventional human-centred storytelling. Human characters remain important, but their lives are embedded within much larger ecological networks. The tree becomes more than a literary symbol.

Robin Wall Kimmerer: Indigenous Ecological Knowledge and Reciprocity

Robin Wall Kimmerer's *Braiding Sweetgrass* provides a fundamentally different ecological philosophy. Rather than treating nature as a collection of resources, Kimmerer emphasizes reciprocity between human beings and the more-than-human world. The book combines scientific knowledge with Indigenous ecological understanding and emphasizes reciprocal relationships with plants and other living beings. This perspective is especially important for technological ethics.

Modern industrial systems frequently operate according to an extractive logic:

Earth → resource → production → consumption → waste

Kimmerer's ecological philosophy proposes a different model:

Earth → gift → relationship → responsibility → reciprocity

This distinction provides a useful framework for evaluating AI.

Donna Haraway and "Making-With"

Donna J. Haraway's *Staying with the Trouble* provides another important theoretical foundation. Haraway challenges the idea that humanity solve ecological crisis through technological mastery or detached observation. She proposes the idea of **sympoiesis**, or "making-with," emphasizing relationships among humans and nonhuman organisms. Her Chthulucene framework stresses the entanglement of human and nonhuman life and encourages practices capable of creating more livable futures. This idea is extended to AI. Haraway's framework also helps challenge the fantasy that technology provides a complete solution to ecological crisis. The future requires collaboration, adaptation, care, and responsibility rather than technological domination.

Artificial Intelligence and the Environment: The Technological Paradox

AI introduces a major paradox into environmental discourse.

On one hand, AI potentially contribute to:

- climate modelling,
- weather prediction,
- biodiversity monitoring,
- precision agriculture,
- renewable-energy forecasting,
- smart electricity grids,
- pollution detection,
- disaster management,
- ecosystem monitoring,
- and environmental decision-making.

On the other hand, AI requires substantial physical infrastructure.

The IEA's 2025 *Energy and AI* report specifically examines both sides of this relationship: increasing

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

electricity demand associated with AI and the potential of AI to transform energy systems through optimization and innovation. The environmental impact of AI therefore needs to be understood across its entire life cycle.

AI's ecological chain
Mining
↓
Manufacturing of semiconductors and hardware
↓
Transportation
↓
Data-centre construction
↓
Electricity consumption
↓
Cooling and water use
↓
Model training and deployment
↓
Electronic waste

The UNEP emphasizes precisely this life-cycle perspective and argues that AI's environmental impact requires systematic assessment. Recent research has further demonstrated the scale of possible water and carbon impacts associated with AI server expansion. One *Nature Sustainability* study estimated substantial annual water and carbon footprints for AI-server deployment in the United States, while stressing the uncertainty associated with efficiency, grid decarbonization, and server location.

From Artificial Intelligence to Ecological Intelligence

One of the major arguments of this paper is that the concept of AI should be expanded through an ecological framework.

Traditional AI discourse often emphasizes:

intelligence,
optimization,
prediction,
automation,
efficiency,
control.

Ecological thinking emphasizes:

interdependence,
adaptation,
reciprocity,
diversity,
resilience,
coexistence,
responsibility.

These two approaches need not remain oppositional. Recent scholarship has begun explicitly exploring the concept of environmental intelligence. It proposes a reframing of AI around sustaining and enhancing life on Earth rather than simply maximizing computational capability. Sabina Leonelli argues for a conception of environmental intelligence in which digital systems are understood as embedded within ecological and social relations. This idea is developed into an ecocritical concept:

Ecological Intelligence

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Ecological intelligence is the capacity to recognize technological, human, and nonhuman systems as interconnected and to evaluate technological decisions according to their consequences for planetary life.
This concept involves five principles:

1. Material Awareness
Every digital system has a physical ecological footprint.
2. Relational Thinking
Technology exists within social and ecological networks.
3. Nonhuman Consideration
Technological decisions should account for animals, plants, ecosystems, and future generations.

4. Reciprocity
5. Long-Term Responsibility
Technological innovation should be evaluated according to long-term ecological consequences rather than immediate economic gains.

Literature as an Ecological Technology:
The relationship between literature and technology is often framed in terms of opposition: literature represents human creativity whereas technology represents mechanical efficiency. This distinction is increasingly inadequate. Literature itself is a technology of imagination. AI processes enormous quantities of information. Literature transform information into meaning. Literature makes those scenarios emotionally intelligible. AI identifies patterns. Literature asks whether those patterns are ethically desirable. Therefore, the sustainable future requires neither the rejection of technology nor the replacement of literature by technology. It requires dialogue between them.

Comparative Analysis of Selected Texts:
The following table presents a comparative **pre–post analysis** of selected literary texts and contemporary AI/environment discourse. The **pre** perspective represents conventional anthropocentric, technological, or extractive approaches, while the **post** perspective highlights ecological awareness, reciprocity, multispecies relationships, and sustainable technological thinking.

Text	Central Ecological Concern	Technology	Ecocritical Contribution
Oryx and Crake	Ecological and biological collapse	Genetic engineering and corporate technology	Critique of technological mastery
The Great Derangement	Climate change and literary representation	Modernity and technological systems	Critique of literary failure to imagine climate crisis
The Overstory	Forest destruction and biodiversity	Industrial modernization	Multispecies consciousness
Braiding Sweetgrass	Ecological reciprocity	Science and knowledge systems	Indigenous ecological ethics
Staying with the Trouble	Multispecies survival	Science and technology	Sympoiesis and "making-with"
AI/environment discourse	Climate and technological transformation	Artificial intelligence	Need for ecological intelligence

The comparison given in above table demonstrates a gradual shift from **human domination of nature toward ecological interdependence and responsibility.** While the selected texts critique technological mastery, environmental exploitation, and human exceptionalism, they also propose alternative ways of understanding nature, technology, and survival. In the context of AI, this shift suggests moving from **artificial intelligence based primarily on efficiency and control toward ecological intelligence grounded in sustainability, reciprocity, and long-term planetary well-being.**

Findings of the Study:
The study produces the following major findings.

Ecocriticism is increasingly interdisciplinary: Contemporary ecocriticism extends beyond nature writing into climate change, environmental justice, Indigenous studies, posthumanism, animal studies, technology, and digital culture.
Literature challenges technological determinism: Atwood and other speculative writers demonstrate that technological capability does automatically produce social or ecological progress.
Literary imagination is essential to climate consciousness: Ghosh demonstrates the difficulty of representing planetary environmental crisis through conventional literary forms.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Human exceptionalism must be reconsidered: Powers, Kimmerer, and Haraway demonstrate different ways of decentring the human subject.

AI is environmentally ambivalent: AI support environmental monitoring, energy optimization, and climate-related research, but its infrastructure consumes energy and resources. The IEA explicitly identifies both dimensions.

AI must be evaluated across its entire life cycle: UNEP emphasizes that the environmental footprint of AI must be considered from production through use and disposal.

Sustainability requires ethical imagination: Technological efficiency alone is not guarantee sustainability.

Ecological intelligence offers a useful conceptual framework: AI should be understood as embedded within ecological systems rather than positioned outside nature.

Conclusion

The relationship between literature, ecology, and artificial intelligence is one of the defining intellectual questions of the twenty-first century. Climate change has demonstrated the consequences of human activities on planetary systems, while artificial intelligence is transforming the ways in which humans produce knowledge, communicate, make decisions, and imagine the future. The selected literary works reveal those ecological crises are not separated from questions of culture, technology, ethics, and imagination. Margaret Atwood's *Oryx and Crake* warns against technological mastery without ethical responsibility. Amitav Ghosh's *The Great Derangement* demonstrates the difficulty of representing planetary environmental catastrophe through conventional literary structures. Richard Powers's *The Overstory* decentralizes human experience and encourages multispecies consciousness. Robin Wall Kimmerer's *Braiding Sweetgrass* offers an ethics of reciprocity and ecological responsibility, while Donna Haraway's *Staying with the Trouble* emphasizes interdependence and "making-with" other forms of life.

Acknowledgement

I would like to express my sincere gratitude to Dr. Shankar Ambadas Gavali, Associate Professor, Milind College of Arts, Aurangabad, Chh. Sambhajinagar, for his valuable guidance, encouragement, and continuous support throughout the completion of this research paper. His insightful suggestions and academic guidance have been instrumental in shaping this study. I am deeply grateful to Dr. Babasaheb Ambedkar Marathwada University, Chh. Abstract

Four small language models of 124M–1.1B parameters were trained on the same five-task stream with five configurations: full fine-tuning, LoRA (r=8 and 16), bottleneck adapters, and LoRA r=8 with 2% replay. We evaluate task accuracy, backward transfer, forgetting, forward transfer, and learning plasticity. Across four backbones, the final test mean accuracy is 55.0% for full fine-tuning, 72.0% for adapters, and 67.6% for LoRA r=8, a significant gap motivating choice of method. Update size generally tracks forgetting, with one exception discussed in Section VI-A. Full fine-tuning improves learning by 1.3 average points per task, trading approximately 1 point of plasticity for 17 points of retention. The same pattern occurs within LoRA, where forgetting increases from 17.9 points at r=2 to 30.5 at r=64, while learning accuracy increases by less than four points. Model scale only helps weakly: increasing backbone size by x9 reduces full-fine-tuning forgetting by only 4.6 points. Under LoRA, rehearsing 2% of previous data reduces forgetting to 8.4 points, at almost no model cost. For sub-2B models trained sequentially, we recommend either bottleneck adapters or low-rank LoRA to avoid feed-forward updates and retain a small replay buffer when previous data are available.

Keywords: *catastrophic forgetting, continual learning, parameter-efficient fine-tuning, low-rank adaption, adapters, small language models, sequential task learning, stability-plasticity*

Introduction

A 0.5B parameter model fine-tuned sequentially for multiple tasks can experience catastrophic forgetting. Performance on earlier tasks decay as it learns new ones. First demonstrated by McCloskey and Cohen [1] and reviewed by French [2], this phenomenon has been shown to be an issue to modern continual learning approaches. The parameter-efficient methods such as LoRA [3] and bottleneck adapters [4] address this issue by freezing the weights of the base model and only updating a small amount of trainable parameters.In this paper we examine if these methods indeed reduce forgetting at the 124M parameter scale. We analyze four backbones, five tasks, five adaptation methods, multiple LoRA ranks, three seeds each and assess accuracy changes for every stage (not only the last) for the majority of them. While previous works showed that at 7B scale, LoRA has lower learning and forgetting rates compared to full fine-tuning [5], we attempt to reproduce these results at a smaller scale.Adapters overall appear to have the best retention, while LoRA frequently outperforms full fine-tuning. The volume of parameters updated appears to have a stronger effect on forgetting than the type of adaptation. Accuracy decreases of less than one percentage point across stages are common for most methods, and have little practical impact.The paper describes the problem and objectives, reviews the related work, describes the methodology, provides the backbone-wise results, evaluates rank, module placement, rehearsal, task order and learning rate, and concludes with practical implications and limitations.

OPEN ACCESS

Statement of the problem

The sequential fine-tuning on the tasks T1-T5 leads to significant and non-monotonic forgetting of previous tasks. For example, the GPT-2 Small model achieved 87.15% accuracy on the AG News classification task before any fine-tuning iterations, but only 25.90% after the full course of the fine-tuning, thus approaching the majority baseline of 25%.

What are the research questions addressed by this paper?

- Measurement gap: How do language models retain their performance on previously learned tasks when trained on new data to adapt them to different downstream tasks?
- Scale gap: While most of the previous studies focused on the 7B+ parameter models, there is a gap in understanding how the lower-parameter models retain previously acquired knowledge.
- Attribution gap: The comparison between the LoRA and full fine-tuning approaches typically does not account for the differences in rank, frozen parameters, location of updates, and other factors that may contribute to the difference in retention.

Therefore, this study investigates what amount of forgetting is incurred by each adaptation method, what amount of new knowledge is sacrificed for it, and what properties of adaptations are responsible for these sacrifices and forgetting in the context of small language models that undergo sequential, non-rehearsal fine-tuning.

Objectives of the study

The study was designed to address the following questions:

1. How much is forgotten under a given five-task stream for full fine-tuning, LoRA of ranks 8 and 16, and bottleneck adapters of four backbones of 124M and 1.1B parameters in between? The complete accuracy matrix was used, not just task-end accuracy.
2. How much stability-plasticity trade-off in points does a given method have? Within-task accuracy loss was used to quantify the price in stability paid for increased retention.
3. Does the method dictate forgetting or is it determined by the effective update size? This was tested by varying the LoRA rank from 2 to 64 and sweeping the same rank across attention and feed-forward layers.
4. Is there a scale within the sub-2B range that reduces forgetting for a given backbone, and how much is it reduced per unit of scale?
5. How much is the observed forgetting explained by two internal measures, relative weight drift and representational similarity to the initial checkpoint, and can either be used as a practical proxy for retention worth tracking?
6. How much rehearsal is needed to close the observed gaps, and what is the computational and storage cost of each configuration in terms of memory footprint and operations?
7. A selection rule was needed for the method picking without performing the sweep.

Literature review

A. Catastrophic Forgetting and Continual Learning

The sequential nature of fine-tuning can cause subsequent updates to overwrite solutions found by earlier training, because gradient descent updates do not explicitly preserve past tasks [1], [2]. Previous work has proposed classical approaches such as regularization-based methods [6], [7], rehearsal-based methods [8], [9], [10], and architectural approaches [11], [12].

B. Parameter-Efficient Adaptation

A variety of work has proposed parameter-efficient fine-tuning methods, which reduce the number of trainable parameters through a bottleneck, such as adapters [4], [13] or low-rank updates [3]. Other approaches proposed to only update biases or scaling factors [14], [15], input-side parameters [16], [17], or combine LoRA with quantization via QLoRA [18]. Each of these methods only fine-tune a small amount of parameters compared to full-model updates, and thus maintain the weight distribution of the base model. Aghajanyan et al. [19] further showed that the parameter-space manifold of such an adapted model typically lies in a low-dimensional subspace.

C. Forgetting Under Parameter-Efficient Adaptation

Luo et al. [20] analyzed interference during continual instruction tuning, while Biderman et al. [5] found that LoRA at 7B and 13B scales learns less and forgets less than full fine-tuning. Wu et al. [21] and Ke and Liu [22] provide surveys over the above literature, while recent adapter-based work [23] reduces interference by decoupling the task-specific adapters.

D. Research Gap

This work is motivated by three gaps in the literature: first, most prior work does not perform

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

controlled comparisons at small model-scale, second, the accuracy decay across steps is not well-understood, and third, there is limited quantitative analysis over the plasticity-stability trade-off. Our work begins to address each of these gaps by performing controlled experiments over parameter-efficient methods at 124M parameters.

V. EXPERIMENTAL SETUP

GPT-2 Small	124M	12	768	12	50257	1024	29.4
Pythia-410M	410M	24	1024	16	50304	2048	16.2
Qwen2.5-0.5B	494M	24	896	14	151936	32768	14.8
TinyLlama-1.1B	1.1B	22	2048	32	32000	2048	11.9

Four decoder-only backbones spanning 124M–1.1B parameters were selected (Table I): GPT-2 Small [24], TinyLlama-1.1B [25], Pythia-410M [26], and Qwen2.5-0.5B [27]. The range was chosen to compare a capacity-limited model with a larger model and two intermediate models with different tokenizers and pretraining mixtures. A held-out 2M-token WikiText-103 slice measured base perplexity as a reference for general-capability drift (Section VI-F).

B. Task stream

TABLE II: TASK STREAM IN PRESENTATION ORDER

Stage	Dataset	Type	Train	Eval	Majority (%)
T1	AG News	topic, 4-way	16,000	2,000	25.0
T2	SST-2	sentiment, 2-way	16,000	872	50.9
T3	TREC	question type, 6-way	5,452	500	22.9
T4	BoolQ	yes/no QA, 2-way	9,427	3,270	62.2
T5	Emotion	affect, 6-way	16,000	2,000	33.5

Five classification tasks were presented once each in the Table II order and formulated as constrained single-token generation using a common instruction template and restricted label vocabulary, avoiding classification-head confounds. AG News and TREC shared topical features, SST-2 and Emotion were similar in task type, while BoolQ was the only reading-comprehension task and remained near the majority baseline. Two alternative task orders are reported in Section VII-D.

C. Adaptation methods

Five configurations were evaluated. Full fine-tuning updates all weights. LoRA [3] freezes the base model and applies rank-(r) updates to query and value projections:

$$h = W0 \cdot x + (\alpha/r) \cdot B \cdot A \cdot x, \quad B: d \times r, \quad A: r \times d \text{ ---------- } (1)$$

W0 is frozen, A is initialised from a scaled normal, B is set to zero, and α is fixed at twice the rank. We ran r = 8 and r = 16. The bottleneck adapter follows the single-module placement of Pfeiffer et al. [13] and is inserted after the feed-forward sublayer with a residual connection,

$$h \leftarrow h + W_up \cdot GELU(W_down \cdot LN(h)), \quad bottleneck\ d_b = 64 \text{ ---------- } (2)$$

LoRA r = 8 with a rehearsal buffer holding 2 percent of each earlier task forms the fifth configuration. The buffer is sampled uniformly at the end of the stage and mixed into later batches at the same 2 percent rate. It serves as a control rather than a contribution, and its purpose is to bound how much of the gap is closed by the cheapest possible intervention. The trainable budgets are given in Table III. The adapter trains two to four times more parameters than LoRA r = 8 and still retains better.

D. Training protocol

TABLE III: TRAINING CONFIGURATION

Setting	Value
Optimiser	AdamW, β = (0.9, 0.999), wd 0.01
LR, full fine-tuning	2e-5, linear decay, 6% warmup
LR, LoRA and adapters	2e-4, linear decay, 6% warmup
Effective batch	16 sequences, 512 tokens max
Micro-batch	1 to 16, set by the 12 GB VRAM budget
Steps per task	600 (roughly 0.6 to 1.8 epochs)
Precision	bf16 compute, fp32 master weights
LoRA dropout	0.05
Adapter activation	GELU, LayerNorm before down-projection
Seeds	3 (17, 42, 1337), mean reported
Selection	last checkpoint, no early stopping

Table III shows the setup of the experiments. As a full fine-tuning uses a learning rate about 10× bigger than the parameter-efficient methods we tested, we tested the effect of a learning rate by sweeping from 5e-6 to 5e - 5, to rule out its confounding effects. We always used the final checkpoint, without any early stopping. Each run was performed using a single continuous prompt, only reset for different tasks, without using previous data points as rehearsal set. After each stage, the model was evaluated on all five test sets to evaluate learning and forgetting.

E. Metrics

R(i, j) denotes accuracy on task j after training on task i has finished. Four numbers summarise the matrix.

$$ACC = (1/T)\ \Sigma\ R(T, j) \text{ over } j = 1 \ldots T \quad \text{----------} \quad (3)$$

$$BWT = (1/(T-1))\ \Sigma\ [R(T,j) - R(j,j)] \text{ over } j < T \quad \text{----------} \quad (4)$$

$$F = (1/(T-1))\ \Sigma\ [\max R(I,j) - R(T,j)] \text{ over } j < t,\ i \geq j \quad \text{----------} \quad (5)$$

$$FWT = (1/(T-1))\ \Sigma\ [R(j-1,j) - b(j)] \text{ over } j > 1 \quad \text{----------} \quad (6)$$

Mean accuracy over all tasks once the stream ends is given by ACC. The mean change on earlier tasks relative to the accuracy each one reached when it was current is given by BWT, so forgetting makes it negative. The mean drop from the peak is given by F, and this is the number we quote most often. F measures the accuracy decline from maximum accuracy previously attained on each earlier task to its final accuracy after the complete stream. We also add learning plasticity, LP, defined as the mean of the diagonal R(j, j), because a method that retains everything while learning nothing would score well on the first three metrics and still be useless.

F. Hardware, memory ceiling, and cost

TABLE IV: WORKSTATION USED FOR EVERY RUN

Component	Specification
CPU	AMD Ryzen 9 7900X, 12 cores, 24 threads
GPU	NVIDIA RTX 4070 Super, 12 GB GDDR6X, 504 GB/s
System memory	64 GB DDR5-6000, dual channel
OS and stack	Ubuntu 24.04, CUDA 12.4, PyTorch 2.4.1
Libraries	PEFT 0.12, bitsandbytes 0.43, Transformers 4.44
Dataloader	8 worker processes, tokenised corpora cached in RAM

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

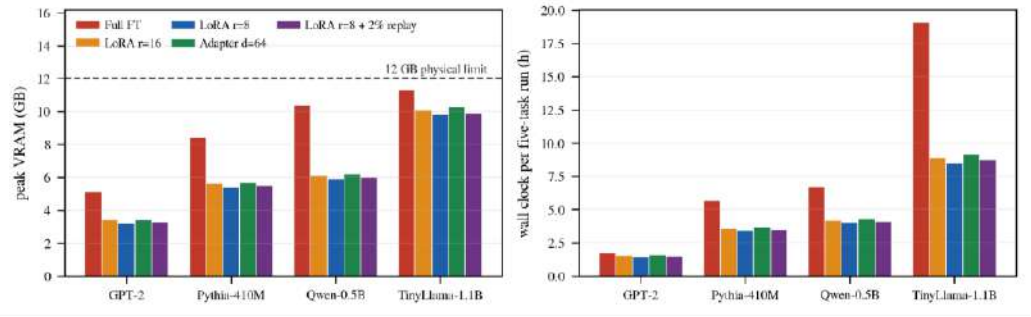

Fig. 1. Peak VRAM and wall clock for one complete five-task run on the RTX 4070 Super. Full fine-tuning approaches the 12 GB ceiling on the two larger backbones and needs memory-saving measures to run at all, while the parameter-efficient methods leave headroom.

Fig. 1 summarizes the results for the hardware constraints of the experiments. Fine-tuning the model of TinyLlama-1.1B required utilizing a GPU with a memory size of 12 GB. It involved model checkpointing, a batch size of 1, 8-bit optimizer, and offloading to the CPU, which consumed 11.3 GB and took more than 19 hours for each run. Training the LoRA (r=8) model took 9.8 GB and about 8.5 hours. In general, the experiments consumed 454 GPU-hours in total, with full-model fine-tuning accounting for 61% and having the lowest retention rate. It reflects the significant practical benefit of using parameter-efficient methods for training large language models on consumer-grade graphics processing units.

VI. RESULTS

A. Aggregate picture

TABLE V: MAIN RESULT. ALL METRICS IN PERCENTAGE POINTS, MEAN OF THREE SEEDS

Backbone	Method	LP ↑	ACC ↑	BWT ↑	F ↓	FWT ↑

Backbone	Method	LP ↑	ACC ↑	BWT ↑	F ↓	FWT ↑
	LoRA r=8 + 2% replay	87.75	82.49	-6.57	6.60	3.05

LP is mean diagonal accuracy (learning plasticity). ACC is mean accuracy after the final task. BWT is backward transfer, F is forgetting, FWT is forward transfer over the majority baseline. Seed standard deviation ranged from 0.31 to 1.14 points and is omitted for width.

Table V is the headline, with the ACC and F columns read together. On every backbone, the same ordering is observed, with the adapters placed ahead of LoRA r = 8, LoRA r = 16 ahead of full fine-tuning, and full fine-tuning last, with rehearsal above them all, the gaps not marginal. On Qwen2.5-0.5B, 73.32 percent mean accuracy was reached by the adapters against 56.28 for full fine-tuning, a difference of 17.0 points produced solely by where the gradient was allowed to go.

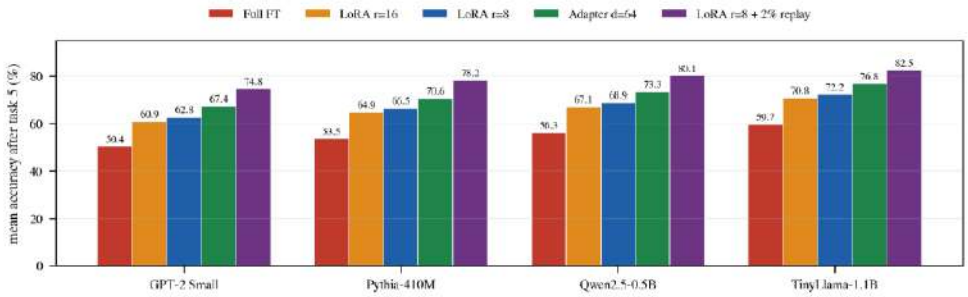

Fig 2. Mean accuracy across all five tasks measured after the final task. The ordering of the five adaptation methods is the same on every backbone, The same numbers are presented as bars in Fig 2. The approximate constancy of the vertical offsets for different backbones is the pattern. Scaling up the model from 124M to 1.1B increased the performance of all methods by approximately the same absolute amount; therefore, the effect of scaling and adaptation was nearly linear and additive within this range, and a bigger model did not compensate significantly for a worse adaptation and the global fine-tuning deficit narrows slowly with scale

method.The plasticity cost is encoded in the LP column; it is also small. Full fine-tuning achieved an average of 86.22, compared to 84.99 for the adapters and 84.92 for LoRA r = 8. Thus, 22.9 points of retention were purchased for 1.3 points of task-head accuracy loss. I was surprised by the low value and think that this is the most valuable finding in this work.

B. Weight drift and general-capability damage

TABLE VI: INTERNAL DRIFT AFTER THE FULL STREAM

Backbone	Method	‖ΔW‖ / ‖W0‖ (%)	CKA vs base	WikiText ppl	F
GPT-2 Small	Full FT	4.62	0.58	78.2	40.72
	LoRA r=16	1.31	0.84	44.6	26.51
	LoRA r=8	0.89	0.87	41.1	23.72
	Adapter d=64	0.47	0.91	35.8	17.68
Pythia-410M	Full FT	4.18	0.55	47.3	40.33
	LoRA r=16	1.24	0.83	25.1	24.79

TinyLlama-1.1B	Full FT	3.71	0.64	30.4	36.12

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Backbone	Method	‖ΔW‖ / ‖W0‖ (%)	CKA vs base	WikiText ppl	F
GPT-2 Small	Full FT	4.62	0.58	78.2	40.72
	LoRA r=16	1.31	0.84	44.6	26.51
	LoRA r=8	0.89	0.87	41.1	23.72
	LoRA r=16	1.12	0.86	17.8	21.89
	LoRA r=8	0.77	0.89	16.0	19.39
	Adapter d=64	0.41	0.93	14.2	13.77

Weight drift is the Frobenius norm of the merged update relative to the base weights, averaged over transformer blocks. CKA is linear centred kernel alignment of final hidden states on 2000 held-out sentences. Base perplexities are in Table I.

Table VI indicates whether an internal measure of forgetting is sufficiently predictive to be worth logging and confirms this suspicion with qualified positives. Within each backbone, weight drift strongly predicts F. Full fine-tuning achieved around 4 percent Frobenius-norm weight drift, compared to 0.8 percent for LoRA r = 8 and 0.45 percent for adapters. The ordering of forgetting was also identical for all methods. Across all backbones, the strength of the relationship decreased, but TinyLlama demonstrated similar levels of forgetting to GPT-2, despite having only 3.71 percent weight drift under full fine-tuning, compared to 4.62 percent in GPT-2.

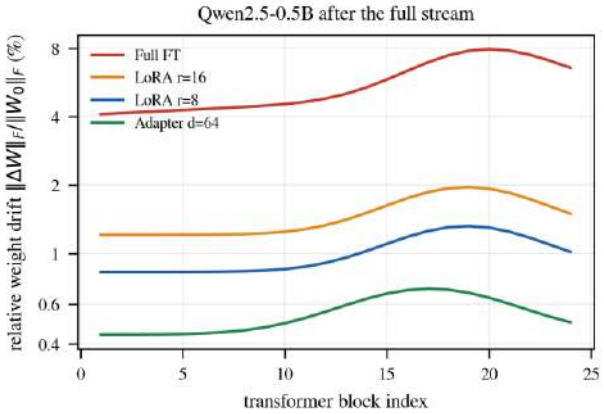

Fig. 3. Relative weight drift by block depth on Qwen2.5-0.5B after the full stream, log scale. Every method concentrates its update in the upper-middle blocks, and the methods differ in magnitude by roughly an order of magnitude at every depth.

Figure 3. shows that all methods have their biggest parameter shifts at layers 17 - 20, with the first four layers barely changed. This suggests that the different methods only vary in the amount of shift but not its location, which implies that all reduce overall forgetting rather than being better at preventing forgetting of particular layers. The perplexity also increased for all methods, from 14.8 to 41.6 for Qwen2.5 - 0.5B when using full fine-tuning and from 14.8 to 17.4 when using adapters. This suggests that general language understanding abilities should be evaluated independently of task performance.

Character Count: 16Word Count: 2Line Count: 1

Ablation studies

All ablations were run on Qwen2.5-0.5B using the same stream, with seed 42, unless otherwise noted.

A. LoRA rank

TABLE VII: LORA RANK SWEEP, QWEN2.5-0.5B

r	% params	LP	ACC	F
2	0.035	84.10	69.92	17.94
4	0.070	85.32	69.55	19.60
8	0.139	86.21	68.88	21.66

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

r	% params	LP	ACC	F
16	0.279	87.09	67.09	25.00
32	0.558	87.63	64.83	28.31
64	1.116	87.88	63.10	30.52

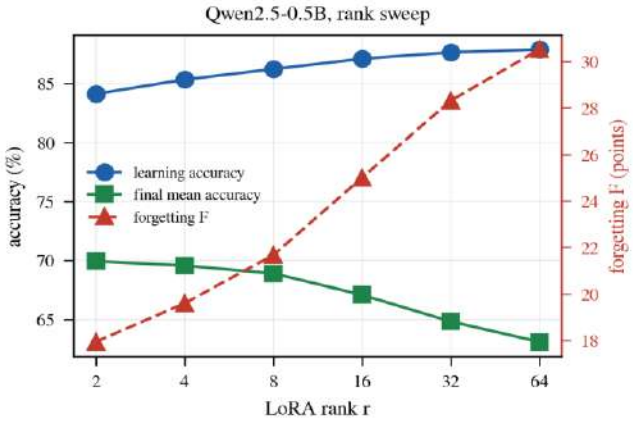

Fig. 4. LoRA rank against learning plasticity, final mean accuracy, and forgetting. Plasticity saturates around rank 16 while forgetting keeps climbing, so ranks above 16 are a straight loss on this stream.

Table VII and Fig. 4 demonstrate that the increase in the LoRA rank leads to a trade-off between the increase in plasticity and the growth in forgetting. Specifically, increasing the rank from 2 to 64 leads to a 3.78 point rise in plasticity and a 12.58 point increment in forgetting. For ranks higher than 16, the growth of plasticity saturates, while the forgetting keeps increasing. Hence, it is suggested to use LoRA ranks of 4–8 for most of the cases, while higher values should be used only if there is a strong indication of the underfit of the current task.

B. Module placement

TABLE VIII: LORA R = 8 MODULE PLACEMENT, QWEN2.5-0.5B

Target modules	% params	LP	ACC	F
q, v (default)	0.139	86.21	68.88	21.66
q, k, v, o	0.278	86.94	66.42	24.83
MLP only	0.371	87.20	63.95	28.10
attention + MLP	0.510	87.71	62.40	30.94

According to Table VII, shifting LoRA updates from attention to feedforward blocks leads to an increase in forgetting from 21.66 to 28.10 points. In turn, updating both attention and feedforward blocks increases it to 30.94. Thus, it can be concluded that attention projections are more effective at preserving knowledge and should be preferred for implementing low-rank updates.

D. Task order

TABLE IX: TASK ORDER, FINAL MEAN ACCURACY, QWEN2.5-0.5B

Order	Full FT	LoRA r = 8	Adapter
AG, SST, TREC, BoolQ, Emo (default)	56.28	68.88	73.32
Emo, BoolQ, TREC, SST, AG (reverse)	52.94	66.13	70.98
BoolQ, AG, TREC, SST, Emo (hard first)	58.91	70.42	74.60
AG, TREC, SST, Emo, BoolQ (grouped)	59.77	71.85	76.04

Table IX presents the results of the performed experiments. It can be seen that the order of tasks matters, as full fine-tuning has a 6.83-point gap, and the gap for adapters is 5.06 points. The best performance was achieved by grouping similar tasks, and the worst result was obtained when the hardest task (BoolQ) was placed at the end. However, the relative ranking of methods remained

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

the same. To obtain reproducible results, it is recommended to group similar tasks and avoid placing the hardest task at the end.

E. Learning rate for full fine-tuning

TABLE X: FULL FINE-TUNING LEARNING RATE, QWEN2.5-0.5B

LR	LP	ACC	F
5e-6	82.41	64.93	24.12
1e-5	85.30	61.24	30.55
2e-5 (default)	87.54	56.28	39.08
5e-5	88.02	49.77	46.83

Table X presents evidence that decreasing the full fine-tuning learning rate decreased forgetting from 39.08 to 24.12 points, but also decreased plasticity by 5.13 points. It still showed worse retention than LoRA and the adapter while updating 720× more parameters and using 1.7× more VRAM.

Discussion and practical guidance

A. What the Numbers Support

Retrieval forgetting mainly depends on the size and position of the updates. Rank-64 LoRA achieved 30.52 points of forgetting, compared to 17.94 for rank-2 LoRA, 39.08 for full fine-tuning, and 15.94 for adapters. This suggests the existence of a continuum between stability and plasticity rather than distinct regimes. The observed trade-off between forgetting and plasticity was on the order of 1:17, suggesting that retention should be considered a critical criterion when choosing between adaptation methods.

B. A Selection Rule

Old data available: Rehearse 2–5% of previous data for overall best retention.

Retention first: Bottleneck adapters (at sixth layer) realized best performance without rehearsal.

No inference overhead: LoRA (rank 4–8) on query and value layers, with merged weights.

Prioritize current task: Full fine-tuning achieved best current-task performance.

Avoid using LoRA with rank higher than 16 or on feed-forward layers. Scaling the model had little effect, adding only 4.6 points of performance for a model nine times larger.

C. Where the Guidance Is Weaker

The rules of thumb apply mainly to dissimilar tasks, where full fine-tuning might actually reduce interference. The validity of the rules of thumb for more than five sequential tasks is also unproven, as the authors did not experiment with extended task sequences.

Threats to validity

The study used five English classification tasks, converted into single-token generations; results for open-ended generation can differ substantially. Three seeds captured the main differences in the method, but were insufficient to reliably identify smaller differences between LoRA ranks. A fixed training budget of steps rather than epochs caused different tasks to see different fractions of the full dataset (especially noticeable for TREC). The 12 GB GPU limit also resulted in different micro-batch sizes, and 8-bit optimizer states for two of the full fine-tuning runs. One bf16 AdamW replication changed the mean accuracy by only 0.42 points, within seed variance. Differing learning rates between methods are another potential source of comparison error, and are discussed in Section VII-E. The BoolQ was almost entirely forgotten by all methods; removing it resulted in 2-4 point changes in method gaps but the same relative ordering. Finally, differing tokenizers, pretraining data, and context length mean that comparisons between backbones should be seen as trends, rather than direct comparisons between model families.

Conclusion

Four small language models were benchmarked on five task streams using five adaptation methods. Full fine-tuning achieved 55.0% average accuracy but incurred 39.1 points of forgetting, compared with 72.0% and 16.2 points for bottleneck adapters while 67.6% and 21.6 points for LoRA rank 8. Reductions in forgetting required only a 1.2-1.3 point plasticity concession. The contribution of update size and location to forgetting was quantified. Increasing LoRA rank from 2 to 64 increased forgetting, but shifting updates to feed-forward layers added 6.44 points. A nine-times larger model reduced forgetting by only 4.6 points, versus 8.4 points for 2% rehearsal, which outperformed other interventions.

For practical recommendations, attention-only LoRA with rank ≤16 or bottleneck adapters are

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

suggested, optionally with a small replay buffer if feasible. Perplexity tracking is also recommended to identify capability loss beyond accuracy. Future work should evaluate open-ended generation and longer task streams.

Abstract

India's vision of Viksit Bharat @2047 requires a digital governance architecture that can transform rapidly expanding volumes of public data into timely, evidence-based, inclusive, transparent, and sustainable policy outcomes. This paper develops an integrated conceptual framework for data-driven digital governance by examining the complementary roles of Data Analytics, Business Intelligence (BI), Digital Public Infrastructure (DPI), and Responsible Artificial Intelligence (AI). Drawing on conceptual analysis and secondary evidence, the study conceptualizes DPI as the foundational layer for interoperable and trusted digital services, while Data Analytics and BI enable the transformation of data into descriptive, diagnostic, predictive, and prescriptive intelligence. Responsible AI further strengthens forecasting, simulation, decision support, and adaptive governance while incorporating principles of transparency, accountability, privacy, fairness, security, and human oversight. A key contribution of the study is the proposed six-level BI maturity model, progressing from Digitization and Reporting to Diagnostic BI, Predictive Analytics, Decision Intelligence, and Adaptive Governance. The model addresses the challenge of dashboard-oriented governance by emphasising the progression from data availability to actionable intelligence, informed decision-making, outcome measurement, and continuous policy feedback. The study also identifies critical barriers, including data fragmentation, interoperability constraints, privacy and cybersecurity risks, algorithmic bias, digital exclusion, institutional capability gaps, and inadequate outcome measurement. To address these challenges, a phased 2027–2047 strategic roadmap is proposed, beginning with common data standards and institutional analytics capacity and progressing toward interoperable, AI-assisted, outcome-oriented, and continuously learning governance systems. The paper argues that India's long-term digital governance advantage will depend not merely on achieving digitalization at population scale, but on developing the institutional and technological capacity to convert data into intelligence, intelligence into informed decisions, and decisions into measurable and inclusive public value.

Introduction

India's digital transformation is entering a stage in which the central challenge is no longer simple digitization, but the conversion of digital capability into measurable public value. The first phase emphasized connectivity, digitization of records and online access to services. A second phase expanded population-scale digital identity, payments, interoperable platforms and digital service delivery.

Quick Response Code:

Website: https://bnir.us

The emerging phase must connect these capabilities with institutional decision-making, policy learning and outcome improvement (Janowski, 2015; Vial, 2019).NPCI's official statistics report 22,346.80 million UPI transactions in April 2026 and 23,201.93 million in May 2026, with corresponding values of ₹29,02,988.05 crore and ₹29,90,424.21 crore (National Payments Corporation of India [NPCI], 2026). The World Bank describes DPI as foundational digital infrastructure built around capabilities such as digital identity, payments and trusted data sharing (World Bank, 2025). Yet data volume does not automatically produce better governance. Public organisations can accumulate fragmented datasets, incompatible definitions, dashboards that report activity rather than outcomes, and AI systems whose outputs are difficult to interpret. Digital transformation research therefore emphasises organisational change, institutional capacity, data governance and user-centred design alongside technology (Mergel et al., 2019; OECD, 2020; UN DESA, 2024).This paper advances an integrated proposition: DPI creates the digital rails; data governance creates trusted and interoperable information; analytics and BI convert information into evidence; AI expands predictive and decision-support capability; and governance institutions convert intelligence into accountable action. The framework is aligned with Viksit Bharat @2047 and the Sustainable Development Goals.

Research Problem and Rationale

The core research problem is how to move from fragmented digitalisation to an integrated governance capability in which data is converted into reliable intelligence and intelligence into accountable action. Digital initiatives may succeed at service digitisation while remaining weak in cross-departmental analytics, outcome measurement, policy simulation and institutional learning. The risk is therefore not a lack of dashboards but a mismatch between information availability and decision quality.The rationale rests on four developments: population-scale DPI; falling analytical costs; stronger Indian data-protection and responsible-AI policy; and international digital-government frameworks that emphasise data-driven, user-driven and proactive government (MeitY, 2025; NITI Aayog, 2021a, 2021b; OECD, 2020). The district is treated as a critical implementation level because national digital rails can provide common standards while district and sector institutions apply local intelligence.

Objectives of the Study

1. To examine the role of Data Analytics and BI in evidence-based digital governance.
2. To analyse DPI as the data and interoperability foundation for analytics-driven services.
3. To examine opportunities and risks of AI-enabled decision support.
4. To identify technological, institutional, ethical, privacy, cybersecurity and inclusion barriers.
5. To propose an integrated Data Analytics–BI–DPI–Responsible AI governance framework.
6. To develop a six-level BI maturity model from digitization to adaptive governance.
7. To propose a phased roadmap aligned with Viksit Bharat @2047 and sustainable development.

Research Methodology

The study adopts a conceptual research design based on secondary data and policy analysis. Evidence is synthesized from peer-reviewed literature, books, international organizations, Indian government policy documents, NITI Aayog publications, MeitY materials and NPCI statistics. The study does not claim a causal econometric relationship; it develops a policy-oriented framework. The analytical process comprises four stages: identification of digital governance building blocks; review of BI, analytics, digital transformation, DPI and AI-governance literature; synthesis of Indian and international policy evidence; and development of an integrated architecture, maturity model and roadmap.

Conceptual and Literature Review

Business Intelligence and Analytics

BI encompasses processes, architectures and technologies used to collect, integrate, analyse and present information for decision-making. BI research has progressed from conventional reporting toward big-data analytics and advanced decision support (Chen et al., 2012; Negash, 2004; Trieu, 2017; Watson & Wixom, 2007). A useful distinction is descriptive what happened; diagnostic why it happened; predictive what may happen; and prescriptive/decision intelligence what actions should be considered (Davenport & Harris, 2007; Provost & Fawcett, 2013).

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

Digital Government and Digital Transformation

Digital transformation is broader than technology adoption because it changes structures, processes, value creation and organisational capabilities (Vial, 2019). Public-sector transformation requires institutional redesign, coordination, skills and user-centred services (Mergel et al., 2019; OECD, 2020). Janowski's (2015) model moves from digitisation through transformation, engagement and contextualisation. Public value research further indicates that digital government should be evaluated through service quality, participation, trust, equity and societal outcomes (Twizeyimana & Andersson, 2019).

DPI and Data Governance

DPI provides reusable digital building blocks that can support multiple services. The World Bank identifies identity, payments and trusted data sharing as important foundations (World Bank, 2025). The World Development Report 2021 argues that data create development value only when infrastructure, rules and trust support responsible sharing and reuse (World Bank, 2021). Data governance therefore requires leadership, standards, metadata, interoperability, security and clear responsibilities (OECD, 2020).

Artificial Intelligence and Responsible Governance

AI extends BI through prediction, anomaly detection, natural-language interfaces, intelligent document processing and recommendations. However, public-sector AI can affect eligibility, enforcement and access to essential services, requiring stronger safeguards (Zuiderwijk et al., 2021). Algorithmic accountability literature highlights transparency, documentation, impact assessment, human oversight and contestability (Kroll et al., 2017; Wirtz et al., 2019). NITI Aayog's responsible-AI framework similarly emphasises safety, equality, inclusion, privacy, transparency and accountability (NITI Aayog, 2021a, 2021b).

From Analytics to Decision Intelligence

The conceptual gap addressed here is the transition from information to action. Decision intelligence connects predictions with objectives, policy constraints, scenarios, simulations and human judgement. Prediction estimates likely states; decision intelligence connects those states to possible interventions and consequences. In public governance, this distinction matters because decisions are constrained by law, budgets, equity, institutional capacity and ethics.

Proposed Integrated Data Analytics–BI–DPI–Responsible AI Governance Framework

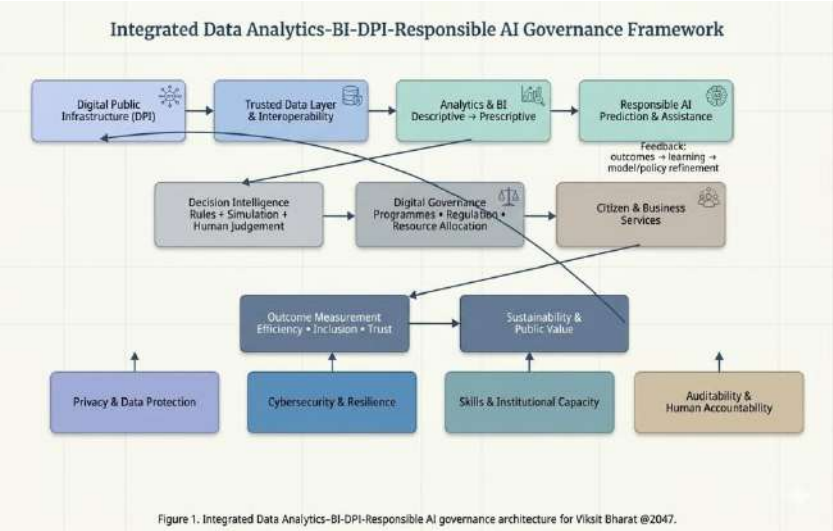

Figure 1. Integrated Data Analytics–BI–DPI–Responsible AI governance architecture for Viksit Bharat @2047.

Figure 1. Integrated Data Analytics–BI–DPI–Responsible AI governance architecture for Viksit Bharat @2047.

The framework contains nine mutually reinforcing components: DPI; a trusted data and interoperability layer; analytics and BI; responsible AI; decision intelligence; digital governance; citizen and business services; outcome and feedback mechanisms; and safeguards covering privacy, cybersecurity, auditability and institutional capacity.The framework is circular rather than linear. Outcomes return to the analytical system so policies can be evaluated, models recalibrated and programmes improved. This reflects data-driven governance approaches in which monitoring and learning are part of

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

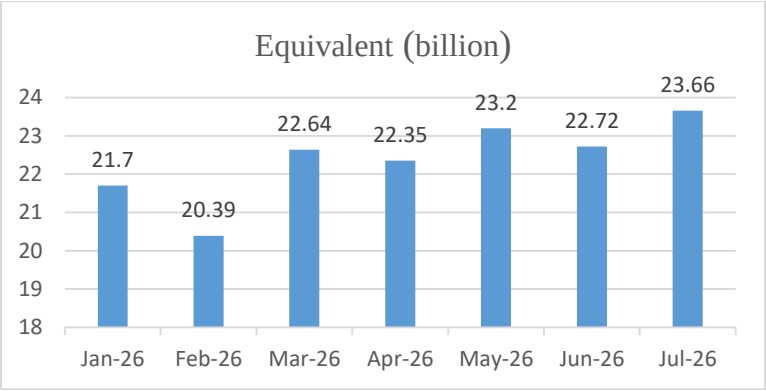
implementation rather than an afterthought (OECD, 2020; World Bank, 2021).

Recent Evidence of India's Digital Transformation
The recent trajectory of India's digital payment ecosystem provides empirical evidence of the expanding scale of digital infrastructure and the growing availability of transaction data for data-driven governance. According to the National Payments Corporation of India (NPCI), UPI processed 21,703.44 million transactions worth ₹28,33,481.22 crore in January 2026. Transaction volume declined to 20,394.18 million in February, while transaction value decreased to ₹26,84,229.29 crore, partly reflecting the shorter month. Activity subsequently increased substantially in March, reaching 22,641.11 million transactions and ₹29,52,542.05 crore. (ETBFSI.com) The upward trajectory continued through the following months. UPI recorded 22,346.80 million transactions worth ₹29,02,988.05 crore in April 2026, followed by 23,201.93 million transactions worth ₹29,90,424.21 crore in May. Transaction volume moderated slightly in June to 22,716.07 million, with transaction value at ₹28,92,138.67 crore. In July 2026, UPI reached a new monthly volume peak of 23,658.35 million transactions, with transaction value of ₹29,87,880.48 crore. (NPCI)

Table 1. UPI Transaction Volume in India, January–July 2026

Month	UPI transactions (million)	Equivalent (billion)
January 2026	21,703.44	21.70
February 2026	20,394.18	20.39
March 2026	22,641.11	22.64
April 2026	22,346.80	22.35
May 2026	23,201.93	23.20
June 2026	22,716.07	22.72
July 2026	23,658.35	23.66

Graph 1: UPI Transaction Volume (Billion)



Source: Compiled by the author from NPCI, UPI Product Statistics. (NPCI)

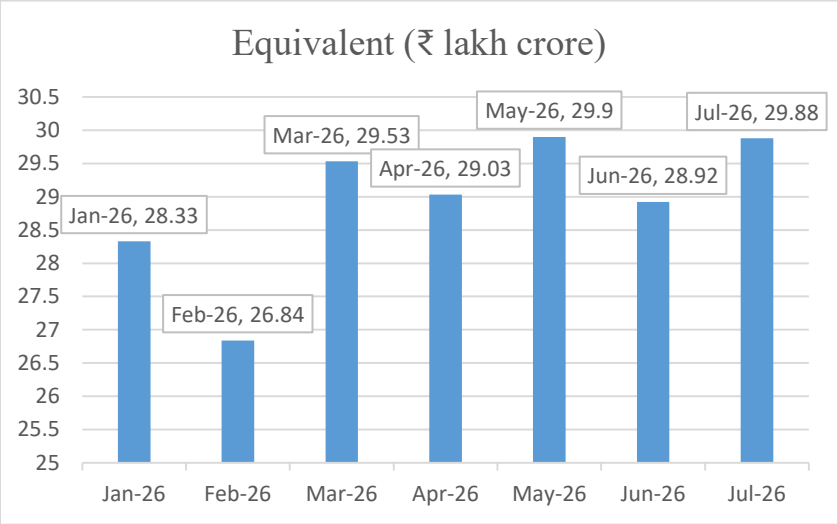
Table 2. UPI Transaction Value in India, January–July 2026

Month	Transaction value (₹ crore)	Equivalent (₹ lakh crore)
January 2026	28,33,481.22	28.33
February 2026	26,84,229.29	26.84
March 2026	29,52,542.05	29.53
April 2026	29,02,988.05	29.03
May 2026	**29,90,424.21**	**29.90**

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

June 2026	28,92,138.67	28.92
July 2026	29,87,880.48	29.88

Graph 2: Transaction Equivalent (₹ lakh crore)



Source: Compiled by the author from NPCI, UPI Product Statistics. (NPCI)

These figures demonstrate not simply the expansion of digital payments but also the emergence of a large-scale, continuously generated digital data environment. From January to July 2026, monthly UPI volume increased from **21.70 billion to 23.66 billion transactions**, an increase of approximately **9.0%**. The July volume was also about **16.0% higher than February**, the lowest monthly volume during the seven-month period. Transaction value similarly recovered from ₹26.84 lakh crore in February to approximately ₹29.88 lakh crore in July. (ETBFSI.com)From a digital-governance perspective, such transaction data can potentially contribute to **economic intelligence, financial-inclusion assessment, demand analysis, fraud and anomaly detection, digital-service planning, and evidence-based policy formulation**, subject to appropriate legal, privacy, security and ethical safeguards. However, transaction volume or value should not be interpreted automatically as a direct measure of household welfare, financial inclusion or economic development. Meaningful governance intelligence requires these indicators to be combined with contextual variables such as income, geography, sectoral activity, demographic characteristics and access to digital infrastructure. The pattern also illustrates an important principle of the proposed **data-driven digital governance framework**: the value of digital infrastructure increasingly lies not only in enabling transactions but also in generating structured, high-frequency data that can support analytical and decision-making capabilities. Consequently, the progression from **digitization and reporting towards diagnostic, predictive and decision-intelligence capabilities** becomes increasingly relevant for Viksit Bharat @2047. The evidence therefore reinforces the argument that India's digital transformation is simultaneously an infrastructure transformation, a data transformation and an institutional-capability transformation.

High-Impact Use Cases

8.1 Agriculture and Rural Development

Combine weather, soil, crop, market, remote-sensing and scheme data to identify drought risk, crop stress, irrigation needs and market patterns. Localized multilingual AI advisory can support farmers while livelihood-sensitive decisions remain subject to human review.

Public Health

Integrate disease surveillance, facility utilization, medicine availability, laboratory indicators and demographic data for early warning and resource allocation. Human professional oversight should remain central to clinical decisions.

Education and Skill Development

Analyze attendance, learning outcomes and completion, employability and labor-market signals to identify skill gaps and target interventions.

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

MSMEs and Entrepreneurship
Provide market intelligence, compliance support and supply-chain insights while preventing discriminatory automated profiling.

Municipal and Urban Governance
Integrate traffic, water, waste, complaints, property tax, building permissions and emergency response. Outcomes should include response time, leakage reduction, collection efficiency and citizen satisfaction.

Social Protection and Welfare
Use analytics for programme monitoring, duplicate detection, grievance analysis and resource planning. High-impact eligibility or fraud-risk systems require rules, human review, appeals and audit trails.

Environmental and Climate Governance
Combine GIS, remote sensing, IoT and AI for water, air quality, forests, disasters and climate adaptation through a sensing-to-decision-to-action cycle.

9. From Dashboards to Decision Intelligence
A major policy risk is dashboard proliferation without decision improvement. A dashboard can make information visible, but visibility is not equivalent to actionability. BI should therefore be assessed through a maturity model that measures progression from digital records to reporting, diagnosis, prediction, decision support and adaptive learning.

Table 3 Maturity level of Digitization to Adaptive governance

Level	Maturity	Core capability	Decision question	Governance output
1	Digitization	Paper/legacy records converted into digital data	What can be captured?	Digital registry
2	Reporting	Periodic reports, KPIs and dashboards	What happened?	Performance dashboard
3	Diagnostic BI	Drill-down and root-cause analysis	Why did it happen?	Bottleneck analysis
4	Predictive analytics	Forecasting demand, risk and resource needs	What may happen?	Forecast/risk score
5	Decision intelligence	Predictions + policy rules + simulation + judgement	What should we do?	Ranked options/scenarios
6	Adaptive governance	Outcomes + feedback + model monitoring + learning	What worked and what should change?	Learning policy cycle

The Viksit Bharat objective should therefore be interpreted as movement toward Levels 5 and 6 while preserving transparency, legality and human accountability. A district collector, municipal commissioner or departmental secretary should not merely receive a dashboard; the system should identify priorities, compare alternatives, expose trade-offs, document assumptions and monitor whether interventions produced intended outcomes.

Performance metrics should evolve with maturity. Levels 1–2 can measure digitization coverage and reporting timeliness; Levels 3–4 can measure diagnostic usefulness and forecast performance; Levels 5–6 should measure decision quality, intervention effectiveness, distributional impact, policy learning, model drift and public trust.

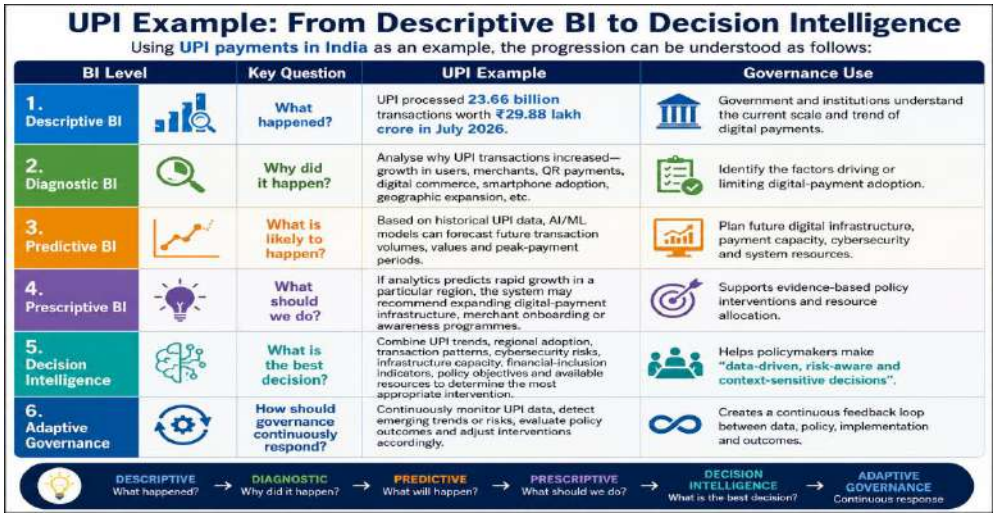

Fig. 2. From Dashboad to Decision Intelligence : BI Maturity for Digital Governance

Decision Intelligence and the Feedback Cycle

Decision intelligence should operate as a closed learning cycle: data and signals are collected and quality-checked; BI establishes the current state; predictive models estimate future conditions; simulation and policy rules generate alternatives; decision-makers authorize action; outcomes are measured; and feedback improves models and policies.

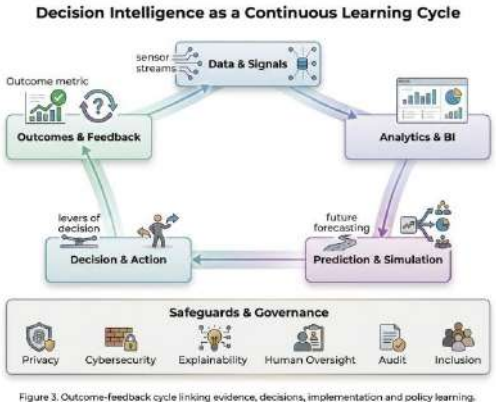

Figure 3. Outcome-feedback cycle linking evidence, decisions, implementation and policy learning.

For high-impact decisions, the cycle should generate an auditable decision record containing data sources, model/version, assumptions, policy constraints, alternatives considered, human reviewer, final decision and observed outcome. This strengthens accountability and supports policy evaluation.

Challenges and Risks

Data Quality and Interoperability

Different departments may use incompatible identifiers, definitions, time periods and geographic boundaries. Common standards, metadata catalogues, APIs and data-quality rules are essential.

Privacy and Data Protection

Analytics increases the possibility of linking personal information. Purpose limitation, lawful processing, access controls, retention rules and privacy-by-design should be embedded in architecture.

Cybersecurity and Resilience

Government systems face ransomware, fraud, identity theft and disruption. Strong identity management, encryption, monitoring, incident response and disaster recovery are required.

Algorithmic Bias and Explainability

Models trained on incomplete or historically biased data can reproduce inequities. High-impact AI requires impact assessment, representative testing, documentation, human review and assurance.

Digital Divide and Accessibility

Digital-first systems can exclude citizens because of connectivity, disability, language or literacy. Multilingual, voice and assisted channels should complement offline options.

Institutional Capacity

Institutions need data stewards, analysts, product managers, cybersecurity specialists and AI-

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

governance expertise to avoid vendor dependence.

Measuring the Wrong Things

Counting transactions is easier than measuring improved lives. Governance analytics should connect digital activity to service quality, inclusion, income, learning, environmental outcomes and trust.

Strategic Roadmap for Viksit Bharat @2047

Table 4 Phased Implementation Roadmap

Phase	Strategic priority	Key actions
2027–2030: Foundation	Common standards and institutional readiness	Data inventories; metadata; district analytics cells; privacy/security baselines; BI capability; 3–5 high-value use cases per district.
2031–2035: Integration	Cross-department interoperability and AI-assisted services	APIs; federated data exchange; outcome dashboards; AI assurance; model monitoring; common KPI libraries.
2036–2040: Intelligence at Scale	Predictive, simulation and decision support	Forecasting and simulation for agriculture, health, education, infrastructure, climate and economic planning.
2041–2047: Adaptive Governance	Continuous policy learning	Outcome feedback; model/policy monitoring; citizen feedback; institutional learning; responsible global sharing of proven approaches.

Implementation should be incremental. Each phase should have readiness criteria and independent evaluation, with district pilots providing evidence before wider scaling.

Policy Recommendations

- Create a public-sector Data Analytics and BI capability framework defining roles, skills, maturity levels and performance standards.
- Adopt 'data once, use many times' principles through interoperable standards while enforcing purpose limitation and security.
- Develop district-level analytics ecosystems because districts connect citizens, businesses, infrastructure and programmes.
- Mandate privacy-by-design, security-by-design and accessibility-by-design for major digital-governance platforms.
- Introduce AI impact assessments and independent assurance for high-impact government AI.
- Require human review, explanation and appeal mechanisms where AI-assisted decisions may materially affect citizens.
- Establish common public-sector KPI libraries so dashboards measure outcomes rather than only activities.
- Use open standards and APIs to reduce vendor lock-in and enable startups, universities and civil society to innovate.
- Build government–university–industry partnerships through applied analytics laboratories, living labs and innovation challenges.
- Use multilingual, voice-enabled and assisted digital channels to reduce exclusion.
- Integrate ESG and SDG indicators into governance BI.
- Publish appropriate non-personal datasets and documentation to stimulate responsible innovation.

Role of Academia–Industry–Government Collaboration

Universities can create interdisciplinary programmes linking management, computer science, statistics, public policy and social sciences. Industry can contribute platforms, engineering and cybersecurity. Startups can experiment with local use cases. Government provides policy direction, datasets, institutional demand and accountability.

A practical mechanism is a Public Digital Innovation Lab at regional or district level. Administrators, faculty, students, startups and community organizations can jointly identify a

© 2026 Bulletin of Nexus| Published by: Royal International Global LLC (USA)

problem, define outcomes, prototype, test, assess privacy and bias, and scale only after evidence of impact.

Alignment with Sustainable Development and NEP-2020

Data-driven digital governance can support SDG 8 through productive enterprises; SDG 9 through digital infrastructure and innovation; SDG 10 through inclusive services; SDG 11 through resilient cities; SDG 13 through climate analytics; and SDG 16 through transparent and accountable institutions (United Nations, 2015). It also aligns with the multidisciplinary and technology-enabled orientation of NEP-2020 (Ministry of Education, 2020). Technology remains a means rather than an end. Sustainable digital governance should be evaluated across economic productivity, social inclusion, institutional trust and environmental responsibility.

Discussion

The central argument is that India's next digital transformation should move from digital service delivery toward data-driven public value creation. DPI provides scale but not automatically good governance; analytics provides intelligence but requires institutional accountability; AI provides prediction but requires explain ability and safeguards; and BI provides visibility but dashboards without outcome metrics can become cosmetic. The proposed maturity model changes the unit of analysis from the technology component to governance capability. The key question is whether an institution can use trusted evidence to make better decisions, implement interventions, measure outcomes and learn. This provides a practical bridge between India's DPI agenda and responsible AI: national digital rails can remain common while decision intelligence is localised to district and sector contexts. A limitation is that the maturity levels and integrated architecture are conceptual propositions and have not yet been empirically validated across Indian districts. Future studies should develop measurable maturity indicators, conduct comparative district case studies and test whether progression toward Levels 5–6 improves governance outcomes.

Conclusion

India has established a strong foundation for next-generation digital governance through digital infrastructure, payments, data systems and emerging AI capabilities. The strategic challenge is to convert these foundations into accountable decision intelligence. This paper proposes an integrated Data Analytics–BI–DPI–Responsible AI framework supported by a six-level maturity model and a phased roadmap. Digitisation is necessary but insufficient; dashboards are useful but insufficient; prediction is valuable but insufficient. Viksit Bharat requires institutions that can combine trusted data, analytics, policy rules, simulation and human judgement, then measure outcomes and learn continuously. The desired endpoint is therefore not an automated state, but an intelligent, inclusive and accountable state in which digital systems strengthen not replace human responsibility.

Abstract

The research paper deals with the geographical, cultural, and religious potential tourist destinations of Nandurbar District in Maharashtra state. India is a developing country, and Maharashtra has a rich cultural and natural heritage. Nandurbar District is part of the Khandesh region, featuring some of the most geographically, culturally, and religiously rich heritage sites in Maharashtra. Administratively, Nandurbar district is divided into six tehsils: Akkalkuwa, Dhadgaon, Taloda, Shahada, Nandurbar, and Navapur. This paper highlights the region's vast potential driven by its unique location in the Satpuda Ranges, featuring sites like Toranmal hill station, dense forests, and religious spots. The development of Nandurbar district depends on the availability of natural, cultural, and geographical tourism potential features as well as available tourism development facilities. The researcher discusses how the tourism development strategy for the Nandurbar district relies on seven key indicators and strategies for the growth of tourism development in the district, including infrastructure development, improved road connectivity, eco-friendly accommodation, promotion, marketing, and the branding of eco-tourism and pilgrimage to boost economic growth and attract national and international tourists.

Keywords: *Developmental Strategy for the Growth of Tourism (DSGT), Tourist Places, Tourism Growth, Key Steps, Geographical, Cultural Features.*

Introduction

Tourism is one of the most important industries in the world, contributing significantly to the nation's gross domestic product (GDP) as well as foreign exchange earnings (FEE). Most countries are using tourism as an important facet of economic and social development by exploiting their historical, social, cultural, and environmental resources. The development of tourism not only creates growth in the tertiary sector but also has a positive multiplier effect, causing growth in the primary and secondary sectors in Nandurbar district and Maharashtra state. **(Raju Yashod, 2023)** The researcher focuses on seven key indicators of growth and tourism development, emphasizing rural tourism development strategies to bring direct and indirect benefits to the local people.

Objectives

2. To study the growth of tourism and developmental key indicators for the study region.
3. To analyze the strategic developmental planning of the Nandurbar District.
4. To correlate key indicators of strategy development and key steps to be taken for the study region.
5. To promote the growth of tourism and the development of tourism policy in the Nandurbar District.
6. To solve the problems and barriers to tourism development in the study region.

Research Methodology

The present study is based on descriptive and empirical research methods. Secondary data was collected through socio-economic reviews, statistical abstracts of Nandurbar District, the Tourism Policy of Maharashtra (2006, 2016, and 2024), the Indian Census Report (2011), the Nandurbar District Handbook, historical and socio-cultural information, district gazetteers and published and unpublished materials like travel books and periodicals. Standardized cartographic techniques and statistical methods were applied to represent collected information, which is presented through analytical tables and text.

Study Region

Locational factors play a unique role in tourism development. Nandurbar district is located in the northwest part of Maharashtra state, a large part of the district falls in the Tapi River basin. Nandurbar district was created with the bifurcation of Dhule district on July 1, 1998. The district is bounded to the south and south-east by Dhule district, to the north is Jhabhua district of Madhya Pradesh, to the west is Surat district of Gujarat state, and the Piedmont plain stretches from east to west. The northern part of the study area is occupied by the Satpura mountain range and the piedmont plain. Physiography and tourism are closely associated with the Nandurbar district, which falls under the Tapi and Narmada Valley regions. The geographical environment provides greater scope for the development of tourism potential in the Nandurbar district. The potential for tourism development in Nandurbar District largely depends on the availability of geographical and cultural recreational resources, like mountain peaks, rivers, lakes, waterfalls, forests, wildlife, historical monuments, objects of art and craft, fairs, or festivals. A person can also be a tourist resource in addition to factors like climate, accessibility, the attitude of local people towards nature, and the extent of tourism development. The southern part is characterised by sheets of Sahyadri Hill, and the Narmada forms the boundary about 70 km from the northern border of the district. The northern boundary of the district is bounded by the great Narmada River. The study area comprises the Nandurbar district of the Satpura range. The Satpura is a broad belt of mountainous land stretching east-west in a wall-like manner on the northern side of the River Tapi. The Satpura Mountain forms about seven major folds with an average height of 600 metres above mean sea level and slopes steeply down towards the Narmada River on the north side of Maharashtra. The Nandurbar district has a dry deciduous type of forest, while the fertile southern plains towards the Tapi regions are predominantly agricultural areas. A large part of the district is in the Tapi River basin.

Plate No 1 Location Map of Nandurbar District

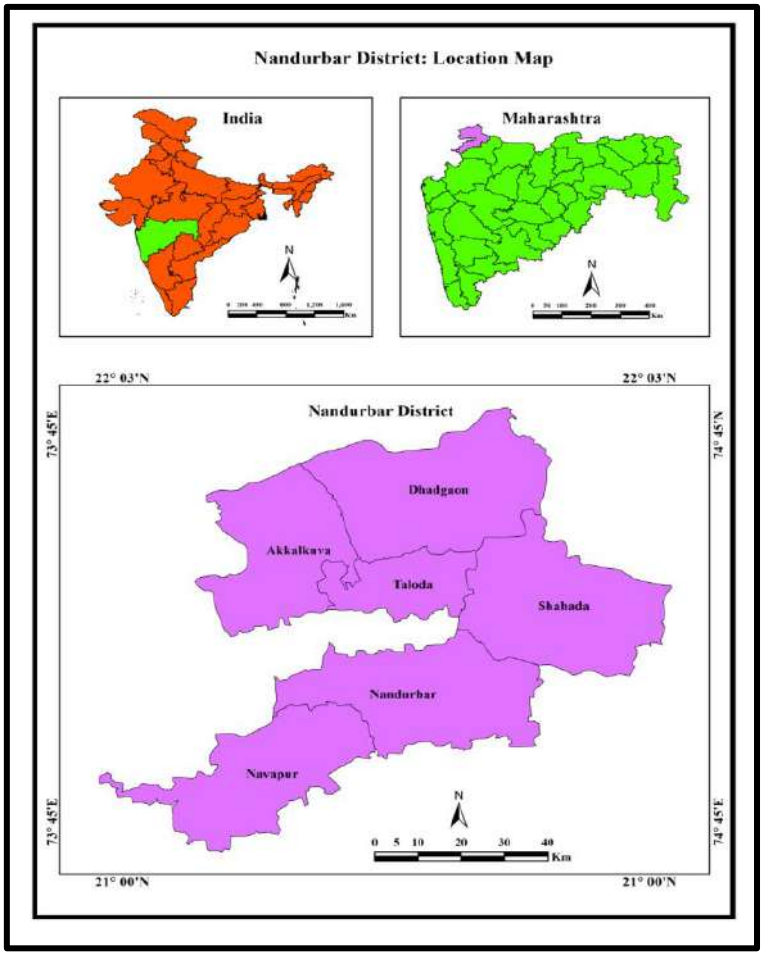

Photo plate No. 1 shows the geographical area of the Nandurbar District as being a part of the state of Maharashtra. The geographic area of the Nandurbar District that is covered lies between 21° 00' and 22° 03′ north latitudes and 73° 31' and 74° 32' east longitudes. The geographically part region of Nandurbar district is situated on the north-western side of Maharashtra. The study region's total area is 5955 square kilometres. **(Stastical Department of Nandurbar, 2022)**

Discussion

Strategic Framework and Developmental Goals:

Strategic planning and development are crucial to maximizing tourism potential in Nandurbar District. Table 1 outlines the overarching vision, mission, and aims of Maharashtra's state tourism development policy.

Table no. 1 vision, mission and aims of the state Govt. of Maharashtra	
Vision	To develop Maharashtra as a popular and sustainable tourist destination wherein the state will offer vast experiences based on global, regional, and local best practices and standards.
Mission	To promote the state as a preferred tourist destination. Development of tourism infrastructure and facilitation of investments in the tourism sector.
Aim	To create an encouraging and conducive environment for private investment in the tourism sector of the state.
Source: - (Tourism Department Government of Maharashtra, 2024)	

Goals of Achieving Developmental Tourism Strategy (DSGT)

A. Special Thrust Sectors: Focus on Toranmal (second coolest place in Maharashtra), the global village of *Sarangkheda, the "Dakshin Kashi" of Prakasha*, and the eco-tourist site of Dab.

B. Cruise and Water Tourism: Promote the *Sardar Sarovar* backwater portion from Nandurbar (Toranmal base) to the Statue of Unity along the Narmada River Cruise project, alongside local ferry cruises at *Prakasha* and *Sarangkheda* Barrages on the Tapi and *Gomai rivers*.

C. Adventure and Monsoon Tourism: Boost forest trails, botanical gardens, and boating facilities near *Bhusha Point* on the Narmada River (Dhadgaon tehsil).

D. MICE Bureau: Create a Tourism Meetings, Incentives, Conferences, and Exhibitions (MICE) Bureau to organize world-class events and skill development training for tribal populations.

E. Tourism Mitra Task Force: Deploy a specialized task force (involving retired security personnel and local bodies) to ensure safety, visitor assistance, responsible tourism, and the prevention of non-biodegradable/plastic waste at tourist destinations.

Tourism Developmental Strategy (TDS) and Key Action Steps

The tourism development strategy for the Nandurbar Region relies on seven key indicators and structured action steps, detailed below in Table 2.

Strategy Indicator	Key Steps to be Taken
Sectorial Growth & GSDP	Enhance infrastructure facilities; attract business investors and create business opportunities for local communities.
Job Creation & Skill Development	Emphasize regional and mega tourism industries; launch skill development programs; promote agro, eco, rural, adventure, and event tourism (e.g., *Chetak Festival in Sarangkheda).*
Institutional & Governance Facilities	Establish a decision-making Tourism Development Committee via the District Tourism Promotion Committee (DTPC) and the Tourism Action Plan 2022.
Spatial Tourism Zones	Develop special zones based on land, mountain, and water-based adventure features; establish a Tribal Culture museum and caravan parks.
Tourism Growth Corridors	Create separate tourist clusters and corridors connecting locations like Nandurbar-Prakasha-Toranmal and Shahada-Unapdev-Pandavleni.
Public-Private Partnership (PPP)	Partner with ITDC and the Government of Maharashtra to develop regional and mega projects (e.g., Prakasha-Sarangkheda ferryboat).
360-Degree Marketing & Promotion	Organize international/national conferences, develop a world-class portal, brand tribal festivals (Rajwadi Holi in Kathi), and promote adventure sports.
Source: - Tabulation by Researcher	

Tourist Circuit Planning and Development

Table 3 outlines the planned tourist circuits, entry points, and destination nodes across the district's tehsils.

Tourist Circuit	Entry Point	Name of Tourist Destination
Nandurbar to Prakasha	Prakasha	Kedareshvar–Gautameshwar–Sangameshvar
Nandurbar to Shahada	Sarangkheda	Dattatraya Temple - Sarangkheda horse bazaar - Unapdev - Pandavleni Jain complex
Shahada to Toranmal	Mhasavad	Toranmal forest - Gorakhnath Cave Temple - Yashwant Lake - Lotus Lake - Sita Khai - Khadki Point
Nandurbar to Toranmal	Prakasha	Prakasha - Unapdev Hot Spring - Toranmal forest - Gorakhnath Cave Temple - Yashwant Lake - Lotus Lake
Taloda to Kathi	Akkalkuwa	Walheri waterfall - Kundaleshwar Hot Spring - Eco Tourism Site of Dab - Religious Holy Place Kathi
Nandurbar to Dhadgaon	Akkalkuwa	Eco Tourism Site Dab - Religious Holy Place Kathi - Dhadgaon - Bilgaon Twelve Mouth waterfall - Akrani Fort
Nandurbar to Navapur	Nandurbar	Kaka Kaki Waterfall - Kondya Waterfall - Borpada Dam - Rangavali River - Tulsi Peak - Devmogra Temple

Advantages and Disadvantages of Tourism Growth Strategy

Advantages

A. Job Creation: Direct employment in hospitality and indirect employment in transport and maintenance.

B. Infrastructure Upgrades: Improvements in roads, railways, water supply, and electricity grids.

C. Entrepreneurship & Skills: Encourages local enterprise, language proficiency, and technical skill adoption.

D. Multiplier Effect: Stimulates primary, secondary, and tertiary economic sectors.

Disadvantages

A. **Industry Dependency:** Vulnerability to disruptions from natural disasters or regional unrest.

B. **Inflationary Pressure:** Price spikes in local consumer goods and services during peak seasons.

C. **Opportunity Cost:** Capital expenditure on tourism infrastructure versus core public services like health and education.

D. **Environmental Stress:** Infrastructure strain, water pollution, and waste accumulation without adequate sewage management.

Conclusion

Nandurbar District possesses exceptional geographical, cultural, and religious potential for sustainable tourism development. By implementing structured developmental strategies (DSGT), establishing the *Tourism Mitra* safety framework, and developing integrated tourist circuits across its fifteen key nodes, the region can successfully transition into a vibrant hub for eco-tourism, tribal culture, and pilgrimage. Strategic state policies and private-sector partnerships will be pivotal in driving economic growth, empowering local communities, and ensuring long-term sustainability across the Satpuda ranges and the Tapi-Narmada valley.

Acknowledgement

I would like to express my sincere gratitude to all those who supported and guided me in completing this research work entitled "A Geospatial Assessment of Tourism Potential and Developmental Strategies in Nandurbar District, Maharashtra." I am deeply thankful to the authorities and staff of C.H.C. Arts, S.G.P. Commerce and B.B.J.P. Science College, Taloda, District Nandurbar, for providing the necessary academic support and encouragement. I also acknowledge the valuable contribution of the Tourism Department, Government of Maharashtra, the Statistical Department of Nandurbar, and other concerned government and institutional sources whose published reports and statistical information provided important secondary data for this study.

Financial support and sponsorship
